I submit that the legal profession in the United States is one of the most valuable assets this country has. Its energies and talent should be directed to the most important problems which we face. A system which diverts so much legal talent to automobile liability settlements and trials wastes a valuable national resource.

There are numerous no-fault plans. The bill before this committee, S. 945, combines good aspects of many of these plans. It would provide reasonable medical expenses, would reimburse the injured for necessary services and, very important, would provide all reasonable expenses for rehabilitation.

At the same time, it limits reimbursement for wage loss to \$30,000. It does not eliminate recovery for catastrophic harm.

Thus, limits are set upon the coverage while the victim of catastrophe may bring a legal action to receive a prompt decision in a court uncluttered by thousands of small automobile liability cases.

Criticisms frequently heard of the State bills relate to the out-of-State accident and the out-of-State driver. While this problem is not insuperable on a State level, it would be eliminated by the proposed Federal bill.

Senator HART. I hate to interrupt, and yet I must welcome the distinguished Senator whom we talked about a few moments ago. I hate to interrupt because the testimony is powerful and I hope will be listened to widely.

Senator CASE. Mr. Chairman, you are most gracious.

I am always happy when I can introduce two people whom I like very much to each other. In this respect, this is no exception.

Mr. Haring is a partner of an old and distinguished firm.

I am enormously happy that I could come in before he finished. I am sorry I was not here when he started. But if you will permit me non pro tunc to present to you one of our distinguished lawyers representing the bar committee on no-fault insurance, I would like to have it entered in the record that I do so. When you and I have long since ceased to be here and come back and look at the record you will not remember that I came in after he started.

Senator HART. We will fix that record.

Mr. HARING. Senator Hart, we need a self-insurance system. We need a no-fault system. We need prompt and well-considered reform. I personally believe that this bill will provide it.

I should say, Senator, my longer statement I hope will be filed and be made a matter of record. I have read a summary of my longer statement, and I am open to any questions.

Senator HART. Mr. Haring, the statement will be printed in full.

I indicated, having had an opportunity to read much of the statement in advance, that it is a powerful plea for the kind of reform that

we are considering here. There is so much in it, brief though it is, that simply puts exclamation points behind so much of what we have heard.

I sense those of us who feel strongly the need for legislation will be excerpting without credit from it in the days and weeks ahead. That expression "drivers play roulette," for example, is really so true under our existing system; whether you are going to be hit by a drunken driver who is heavily insured or a careful driver who may for a moment have been guilty of some omission whose fault is questionable but who isn't insured is a matter of chance.

What I think I would refer to most frequently is the point you make in reply to the argument that a no-fault system rewards irresponsibility and somehow or another has socially unacceptable implications.

In your statement you address yourself to that. You label it an invalid doctrine and conclude by saying, "A no-fault system promotes family integrity, rehabilitation and the self-respect which comes with it." I hope that point will be more clearly understood by all of us as we plow this ground.

It is not easy, I am sure even from so distinguished a firm as yours, to voice opinions that in the sense are regarded by your fellow members at the bar as doing them a direct financial disservice. But you are not alone because the profession happily is coming forward to speak the need for this reform as they see it. But to have one of your standing—and those associated with you in the New Jersey lawyer's committee for no-fault insurance—such as your able chief justice, Chief Justice Weintraub—come forward inevitably will help us make progress. The cumulative effect of this I hope will be great.

Last week this committee heard from a younger lawyer, Robert Joost of Boston who had been associated with the Trial Lawyers Association for some years. Incidentally, his academic credentials I thought would be unmatched, but yours match them, I notice.

Mr. HARING. Thank you.

Senator HART. If there is no objection, I would like to insert in the record a letter that I received from a partner in a prominent Milwaukee firm endorsing the concept of no-fault at the Federal level. He said:

To await action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal jurisdictions.

He concludes by saying:

I am well aware of the objections of lawyers to no-fault insurance. I can't help but feel that much of this complaint is based on the prospective loss of fees. This really is not a valid cause for objection.

This letter along with another from a lawyer who has been an insurance instructor in San Francisco and an orthopedic surgeon will be made a part of the record.

(The letters follow:)

MICHAEL, BEST & FRIEDRICH.
Milwaukee, Wis., April 6, 1971.

SENATOR PHILIP HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: This is to endorse the concept of no-fault insurance on a Federal level. To wait action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal juris-

dictions. The automobile insurance game has reached the point where the rate structures threaten to collapse the whole automobile business. By way of example. I just received a notice from my insurance company declining to renew my insurance of my three cars. There has been no claim under my policy since the last renewal. Heretofore my annual premium has been in the order of \$920. Now they offer to insure me through one of their affiliated companies at extremely low liability limits for an annual premium of \$2,880, approximately triple rate for far less coverage with no claims or traffic violations since the policy was written! The only way I can beat that within that company's structure would be if I would buy my two children old automobiles and put minimal insurance coverage on them. This would then mean that two automobiles of questionable merit and with low coverage would be plying the highways instead of having the kids in proper cars with proper coverage. The insurance company will not recognize an exclusion of the children from specified cars within the family.

I am well aware of the objections of lawyers to no-fault insurance. I can't help but feel that much of this complaint is based on the prospective loss of fees. This really is not a valid cause for objection. Much of the trouble with insurance today relates back to legal fees and pumping up claims for pain and suffering, etc.

BAYARD H. MICHAEL.

NEAR, FRIEDMAN & CRAWFORD,
ATTORNEYS AT LAW,
San Francisco, Calif. March 25, 1971.

Senator PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: Thank you for sending me a copy of your bill for a national no-fault insurance plan.

I have read it and believe it will go a long way to correct the remedies that plague our present system. I do not believe the states, who are in general under the thumb of the insurance lobby and whose members are mostly attorneys, will ever pass adequate legislation. The support for no-fault insurance is growing daily. Enclosed is the March 24, 1971 editorial from the San Francisco Chronicle strongly endorsing a no-fault system.

I do have a few objections to your plan. Perhaps these objections are misfounded, but I believe they might be of some value to you.

1. One of your provisions is that the insurance companies cannot refuse to renew unless the insured has his license cancelled or he refuses to pay the premium. What is to stop the insurance company from raising premiums substantially to anyone they wish to not renew? They can always say the new premium is necessary for *this* particular risk. I see rates going up astronomically for anyone insurance companies decide is undesirable.

2. I think that your plans to let rates be established by a file and use (open competition) type rating law will also lead to rates going up dramatically. I have accumulated some evidence to show that states with file and use laws have higher insurance rates than those where prior approval is required. Some of this evidence is contained in an unpublished article I have written, and I have enclosed a copy of that article. If interested, I could send you some additional evidence along this line. I have little faith in the fact that the Department of Transportation will be collecting various rates for different classifications and promulgating them to the public. The public hardly ever sees these government handouts, and the rates will all be high even if they see them.

3. The basic problem I see with the plan as you propose it is that by making the no-fault insurance compulsory, you will be placing a great many Americans under a severe financial strain, and I believe will create a new breed of criminals, those who drive without insurance. Whereas I heartily approve of compulsory insurance for motorists, I believe it must be at a price all can afford. To make someone pay \$200, \$300, \$500 or \$1,000 for a yearly premium, when he has a limited income, is very harsh. The system which I believe could work best is an insurance plan where all must buy a certain minimum insurance which covers all medical bills without regard to fault. Such a plan has been operating in Puerto Rico since January 1, 1970 and is widely accepted there. I am sure you are familiar with the Social Protection Plan in Puerto Rico (it is briefly described in my enclosed article) and I feel it could be modified in a national plan by 1) substantially raising the loss of wages to the levels set by your bill and 2) only

allowing the tort remedy in cases of catastrophic loss as your bill does, although I believe your criteria a bit harsh.

I believe such a plan could sell in the states for \$50 or less, and this would give the American consumer the break he has long sought. Under private companies, especially with a file and use law to regulate rates, I believe insurance rates will stay very high. The purported 30% reduction in liability rates will be more promise than reality, and although the victim will be infinitely better off, the consumer will still end up paying through the nose.

At the very least, a "watchdog commission" should follow the insurance company rates and determine what constitutes a fair rate of return, what part of investment income should be used in determining the rates, standardize the casualty insurance accounting systems, etc.

In the long run, you are leading a grass roots revolution in the insurance field, and I for one think the only way the consumer will ever get a fair break is when a government agency sells him a policy.

An article entitled "A Call For Adoption of the Puerto Rico Social Protection Plan in the United States" by Jean B. Aponte and Herbert S. Denenberg, professors at the University of Pennsylvania who drafted Puerto Rico's Plan is also enclosed.

I realize the fantastic political pressure that would be involved in getting the government to sell the insurance rather than private companies, but the nation is ready for a revolution, so why not go for a complete victory, rather than a compromise that will still place many consumers of auto insurance under an enormous economic burden?

Sincerely yours,

GILBERT FRIEDMAN.

[From the San Francisco Chronicle, March 24, 1971]

THE 'NO FAULT' INSURANCE PLAN

The Nixon administration, having in hand a \$2 million two-year study by its Department of Transportation, has called for a drastic change in the system of automobile insurance under which drivers are now paying some \$12 billion a year in premiums and getting back about 14.5 cents on the dollar to compensate for economic losses.

It has newly urged Congress to recommend the abandonment of the present tort-liability, or lawsuit system, and suggest that each State enact its own version of the so-called "no fault" system—a system which in essence discards considerations of negligence and promptly and automatically makes benefits available to all accident victims without attempting to establish legal liability.

Adherents of such a plan may not agree as to details, but there is complete agreement that the present system is not working and must be replaced. Insurance companies complain that they are losing millions; the insured complain of zooming rates, and studies by both the Government and the insurance associations reveal that millions of injured accident victims are being grossly underpaid for losses, while a minimal few are fantastically overpaid by sympathetic juries for so-called "general" damages.

The American Insurance Association, representing some 30 percent of the insurers and a pioneer advocate of no-fault insurance, says that under a "pure" no-fault plan, accident victims would promptly recover all medical and hospital costs, and would receive up to \$1000 a month for loss of income, than in case of the death of a wage earner, survivors would receive funeral expenses and a continuing payment of the decedent's wages up to his life expectancy, and that an injured pedestrian would be covered by the car that hit him.

Various other benefits would accrue under such a system, the Association asserts, wherein insurance would be compulsory and no licensed driver would be refused coverage.

What is remarkable indeed is the claim that the cost to the motorist would be 30 per cent less than the premium rates now in effect—a boon made possible by the circumstances that no accident victim could sue or be sued. Thus the massive legal expenses incurred under the lawsuit system would be avoided and much of the approximately \$3 billion a year that now goes to lawyers and investigators would become available for benefits that would comprise around 65 per cent of the premium fund instead of the 14.5 per cent now being paid.

This in some part at least explains why most lawyers and most bar associations oppose the no-fault system. In addition their hostility is based on charges that

"no fault" shifts responsibility for accidents from the guilty to the innocent, that it gives the uninsured guilty benefits that the insured driver pays for, that it forces the owner to pay deductible losses, penalizes the car owners with large families, provides premium cuts for hot rodders, speeders and drunk drivers, confers immunity upon owners of commercial vehicles while shifting insurance costs to owners of private cars and eliminates property damages.

The "no-fault" advocates deny the major charges in full, and concede that some versions of the plan are susceptible in small part to the minor allegations. They argue further that the present system confers no direct benefits whatever upon the insured but actually protects the other fellow and does nothing for the insured but permit him to go into court and sue somebody.

The "no fault" concept is not new. It is, for instance in effect in Puerto Rico in a modified form which limits payments of salary and wages to 50 per cent, up to \$50. Saskatchewan has a plan that compensates for property damage but puts a \$1000 limit on medical and hospital expenses. In the United States, Massachusetts has the only no loss plan now in effect; with a medical limit of \$2000, it was instituted in January and experience to date indicates a saving in premiums of \$76 million for the year. Bills for a Federal plan are now before Congress and State plans are under consideration in various Legislatures, including California's.

How these plans will fare depends largely upon the depth and extent of public dissatisfaction with the present system, which is sharply rising. Thus "No Fault" insurance in various versions appears inevitable. In theory and from the limited experience available, it would also seem highly desirable.

THE PROFESSIONAL BUILDING,
Saginaw, Mich., March 31, 1971.

Sen. PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: Please accept my strong endorsement of your efforts to create a "no fault" automobile insurance system.

An inordinate amount of my time as an orthopaedic surgeon is taken to deal with insurance examinations, litigation, and court appearances in matters of automobile accidents and personal injury. I and my fellow orthopaedic surgeons could much better spend this time taking care of sick people.

Over the past few years I have been impressed by widespread opinion that justice is long delayed by cluttered court dockets. Surely removal of personal litigation from such legal proceedings would go a long way to free the courts to deal with more important matters.

Sincerely,

JOHN O. GOODSELL, M.D.

Senator HART. The orthopedic surgeon writes,

An inordinate amount of my time as an orthopedic surgeon is taken to deal with insurance examinations, litigation, and court appearances in matters of automobile accidents and personal injury.

And he concludes by suggesting that his skills could be better applied elsewhere.

Mr. HARING. I might say I think that is a very frequent reaction that I encounter with doctors.

Senator HART. It is the first time so far as I am aware of that in this set of hearings we have had this note introduced. I wasn't aware that it had this adverse effect on our society.

Having said all that, let me ask the question that so often is addressed us. "Why should I pay for damages to me if somebody who is a drunken driver hits me? Why propose a system that makes me pay for that?"

Mr. HARING. I think the virtue of such a system is, first, that you get paid and you know how much or can reasonably tell about how much you will get paid.

As far as the illustration of the drunken driver is concerned, which I think we have all heard in this debate again and again, I do not conceive that the function of the civil law is certainly primarily to punish and reward, and indeed juries at least in New Jersey are frequently instructed that they are not to award damages as punishment but simply as compensation. So, I think that compensation is what we need in today's automotive society.

As far as punishment, deterrence is concerned, that is as I conceive it primarily the job of the criminal law, and if the driver in your hypothesis is indeed drunk, he would be, at least in our State, punished severely indeed.

Senator HART. I am aware of no jurisdiction where the law would not mark him as one eligible for some sanctions.

There is another recurring theme in these hearings, and if you have a reaction to it we would be grateful.

When we step back a little from the day-to-day debates here, I think we would agree that there is a general acceptance of the idea that we should proceed to a no-fault system. There are some arguments as to form and so on.

Yes, the existing system is inadequate and inequitable; we will have a no-fault system. But let the States construct their systems. They would be more responsive to the character of their people and topography. If they don't move along then the Federal Government can act, and if later it is thought desirable that the Federal Government act we will have had the experience. Therefore, the Federal Government doesn't need to do anything right now.

Mr. HARING. Well, certainly I think many of us have traditionally thought that the idea of experimentalism and pluralism which is supposed to proceed from State legislation is good. However, I think in this particular instance, and I might say I am speaking for myself here, the urgency of the need may very well override some sometimes sentimental thoughts with respect to State control.

Looking at it realistically, it would seem to me that the accomplishment of no-fault in the State, and I am referring to my State, faces a very rough road indeed.

We do have, for instance, an insurance commission which is supposed to be looking into this question, among others. It was unfunded for 13 months and one of the Trenton newspapers recently characterized its reception of Professor Keaton as disgraceful and said that the validity of its final report might be open to question.

Also, a segment of the bar has hired a paid lobbyist, and I saw yesterday in the Newark News on the train coming down here that the New Jersey Bar Association's section on civil procedure, which is meeting in Atlantic City this weekend—in fact right now—may propose such things as a paid lobbyist and other steps with which to fight no-fault.

I think with this type of thing going on in the States, and with the greater susceptibility of State legislatures to local pressure, taken together with the urgency of the need which I believe no-fault fills that Federal legislation may be the only way to get it soon enough and to perhaps prevent a number of States from suffering through some bad experiments.

Senator HART. Thank you, I was not aware of the recent events in New Jersey. But I think it is something that could be anticipated in many of the States.

entry into the tort liability system and in Illinois, no entry provision, but a limitation on intangible loss recovery once tort is entered and an offset for any mandatory first-party coverages? How are we going to get the data to analyze that kind of difference?

Because if we are going to experiment, and the argument is we will learn from experimentation, it seems to me we have to be assured we will be able to get that kind of information back.

Mr. WORTHINGTON. I think I can assure you the NAIC in its normal functions will be gathering this data through the work of its committees, through the analysis of the reports that are filed now with the insurance departments, and which are, some of which are created by private organizations.

Mr. SUTCLIFFE. Is that information oriented toward answering the kinds of questions that are being asked now, or is it more oriented toward a business operation within the existing liability system focus?

Mr. WORTHINGTON. The data we would collect, I would anticipate, would be data that would answer the questions we wanted to ask.

Mr. SUTCLIFFE. So you would have to go through some kind of reformulation.

Mr. WORTHINGTON. If the standard reporting techniques we have now are not adequate, we can easily change them to make them adequate. What I am saying basically, I suppose, is that we think we have a system set up now which could gather the information. If it doesn't, then we can modify it.

Mr. SUTCLIFFE. Will you undergo an examination of that prior to the time of finding out that it doesn't produce the information? I mean are you presently engaged in analyzing your reporting system to make sure that it does the job or will you soon be engaged in that endeavor?

Mr. WORTHINGTON. As soon as we know whether or not the Congress is going to allow us to experiment, we will immediately begin the procedures to comply with the stewardship that you have given us. I think our past record in the past few years in the NAIC at least, is indicative of the fact we will do an adequate job.

Mr. SUTCLIFFE. As to a more basic question about the need for experimentation, how much experimentation was undertaken to test the postinsolvency assessment plans that you have advocated be adopted and have been quite successful in getting adopted in many jurisdictions in this country? When you promulgated that model bill how much experimentation with that system had been undertaken before you set it in concrete, so to speak?

Mr. WORTHINGTON. Before we promulgated our model bill I think there were some six or seven States which already had a form of insolvency fund or form of guarantee fund, and we drafted our bill based on the experience that those other States had had over the past years.

Mr. SUTCLIFFE. Those were all preassessment plans, were they not?

Mr. WORTHINGTON. No; there is a plan like the one in New Jersey, I think—or was it Maryland?—Michigan and California had adopted before our model postassessment plan. One of the things that led us to try the postassessment approach was the experience that they had had with the preassessment plans, and the experience with preassessment plans was such that we felt that was not the proper way to go.

MR. SUTCLIFFE. You mentioned your organization also includes members of the territories of this country. I noted that with interest. Have you had an opportunity to receive the views of the regulatory authorities from Puerto Rico and had a chance to evaluate that particular experiment?

MR. WORTHINGTON. The insurance commissioner from Puerto Rico regularly attends our meetings and participates in our committee functions, and he is very vocal about his experiences in Puerto Rico and feels that it is an excellent program for his territory. He is an active participant.

MR. SUTCLIFFE. Have you come to any conclusions based upon the experience in Puerto Rico as to any recommendation the NAIC would make to States who are going to undertake experiments in reforming their automobile compensation system?

MR. WORTHINGTON. I think it is too early to draw any valid conclusions about the Puerto Rican situation and recommend them to other States on an official basis. Obviously most of us that are interested in it are going to look closely at it because it is an operating one, just like we will the Massachusetts plan.

Senator Moss. Thank you for excusing me for a short time, and I am sure Mr. Sutcliffe has had a number of questions that have occurred to us in listening to your testimony. One thing I wanted to ask, Mr. Worthington, is, you referred in your statement to the danger of an ill-considered national program for insurance reform. Given the Department of Transportation's study and the extensive congressional hearings, do you really think this—it is ill considered to have a bill of this type before us now?

MR. WORTHINGTON. I suppose if I were to give a definition of what I mean by ill considered it would have to be something like this, that any proposal which would change the system which has been in effect as long as the tort system has been in effect in the United States without some measure of experimentation or some trial of a new system on a national basis would have to by definition, be ill considered.

We are not indicating that you have not studied it long enough or that learned people have not given their opinions, but rather we are just saying that by the very extent of the enormity of the program it ought to be tried someplace before it is put forth for the whole country.

Senator Moss. Well, I wonder about the parallel between automobile insurance and health insurance. The administration recommends the State regulation in automobile insurance but recommends a national system of health insurance; why should one be treated one way and the other the other?

MR. WORTHINGTON. We are trying to help them become consistent, Senator.

Senator Moss. Which way?

MR. WORTHINGTON. In favor of the State.

Senator Moss. I was, of course, pleased to note that you recognized that there needs to be changes and there was a great change going on in the industry. Isn't it true that it is less likely that you can get a change effected in all of the State legislatures? State legislators serve for a minimum period of time, and they are all employed in other lines of employment, and, as has been said, they are subject perhaps

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have no easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a great addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and territories of the United States.

I shall deal with each of the matters before your Committee separately and start by giving my comments on the Uniform Motor Vehicle Insurance Act and the Administration's proposed Concurrent Resolution.

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have an easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a real addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and territories of the United States.

I shall deal with each of the matters before your Committee separately and first by giving my comments on the Uniform Motor Vehicle Insurance Act and Administration's proposed Concurrent Resolution.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the Administration has tentatively endorsed the no fault concept, it has concluded that "mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable."¹ The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault upon non fault "is an issue involving wide spread ramifications far beyond the traditional confines and insurance regulations . . .

"The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy."

"Thus NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."²

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Let me add parenthetically that I personally favor the adoption of no fault laws on a state-by-state basis and that I think the need for such laws is of great urgency.

¹ House Concurrent Resolution 241, 92nd Congress, 1st Sess. (1971).

² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Automobile Insurance Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and respond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in the sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objectives.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently

⁴ See *id.* at 112-127.

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

Furthermore, to the extent that the purchasers of automobile insurance consider the relative insurance premiums attributable to damageability in purchasing their cars, the automobile insurance mechanism can contribute to driving those poorly designed cars out of the market and thereby reduce overall economic cost including that of insurance. This, of course, depends upon whether there is a corresponding rise—and to what extent—in cost of designing and manufacturing less damage prone cars and/or in personal injury damage.

Incidentally, it may be appropriate to note some of the factors insurance regulators will be watching as ratemaking based on damageability develops:

(1) Since most individual insurers are not large enough to develop credible statistics, they will find it necessary to pool their data in order to rate older models from real world experience. Insurance departments will be regulating this combining process to protect competition in rates.

(2) Insurance department personnel will be closely examining the results of the prescribed tests to satisfy themselves that there is jurisdiction for rating auto makes and models differently.

(3) Determining the susceptibility of new model cars to damage will require the use of advanced computer techniques. Since many insurers do not have the necessary facilities available they will be using data centrally determined. Departments will wish to satisfy themselves that this data is properly used.

(4) Ratemaking based on relative fragility will result in a different classification system. The departments will be watching these classifications closely to be certain they are equitable and that individual consumers are properly classified.

S. 976 attacks this overall problem head on by authorizing DOT to make tests, set minimum standards, make results available to insurers and regulators for ratemaking purposes, etc. The NAIC endorses the general concepts and objectives embodied in this bill. We would suggest, however, that the bill make explicit direction or authority for DOT to consult with both the insurance industry and the insurance regulators on a continuous basis so that the initial and future tests data compiled therefrom and other information will be developed in a form that is usable in automobile insurance ratemaking.

I would like to personally comment specifically on several provisions of S. 976 at this time:

(1) The provisions found in section 125 (b) and (c) are particularly significant and should be expanded to give the Secretary the widest possible powers and unquestioned authority to act in a direct and definitive manner.

(2) Section 127 is particularly important to insure regulators and I suggest that you amend the bill to provide for an official relationship between the Secretary and the State insurance commissioners in at least two areas: (a) the Secretary should be required to consult with representatives of the insurance commissioners from time to time and (b) the Secretary should be required to officially report his findings to the insurance commissioners of the various States.

I am confident that this kind of relationship will be welcomed by the commissioners and also that they will move rapidly to require implementation of rating techniques based on the damageability studies.

(3) Section 128 appears to also be a key section and I commend you for such a provision. It should be of great assistance in meeting consumer needs.

(4) The provision to section 501 that requires an independent system of automobile inspection, though idealistically sound, has a measure of impracticality involved in it in my opinion. To require the kind of expense involved in establishing the system contemplated in S. 976 is sure to generate enough opposition to stall if not stop the whole inspection program in many places.

I support your concept, but wonder if you shouldn't modify it to make the proposal more palatable and less expensive in order to receive the broadest support from the States.

I would also suggest there should be some official recognition made in the bill which would require that accident data collection systems be established to show the speed, the angle of impact, the frequency of automobile accidents, and other data which would be particularly important in determining the accuracy of the data which might be included in the damageability index.

In a very hurried way, Senator Moss, that concludes my formal testimony.

Senator Moss. Thank you, Mr. Worthington. I think we will have some questions.

I have to be absent for a short period of time.

Mr. Sutcliffe may have some questions while I am away and I will come back and follow up if there are some he didn't get to that I think ought to be in the record.

Moreover, I might suggest, since you have cooperated by summarizing that rather lengthy statement, it may be that after we have read it in full, we may want to submit a few questions to you, sending them to you in writing, to have you respond.

I am sure you would be glad to do that?

Mr. WORTHINGTON. We would have no objection to that, Senator, we would be pleased to.

Senator Moss. Thank you, and if you will excuse me, I will leave Mr. Sutcliffe here and ask if he has any questions he wants to ask in the interim.

Mr. SUTCLIFFE. Mr. Worthington, before we begin any questioning I want to ask whether or not the arrangement that Senator Moss suggested is satisfactory with you?

Mr. WORTHINGTON. I have no objection.

Mr. SUTCLIFFE. Thank you.

The argument that you pose, suggesting that the States be allowed to test various approaches certainly has some appeal from a theoretical standpoint. There are many unanswered questions in this area of considering automobile reform legislation. When you set about to experiment in the laboratory or in a State, do you need to have some guidelines as to the kind of experiment that should take place and the kinds of goals that you would hope would be met through the experimentation, particularly if you are trying to improve the present reparation system or do you think that it can just take place without that guideline, without that kind of direction, so in order to obtain the results of the experiment?

Could you comment generally on how you can undertake this on an experimental basis, assuming this is one of your arguments, and still end up with a valid experiment?

Mr. WORTHINGTON. I would be glad to.

To use as examples some proposals that are already before us, in Massachusetts they passed one form of a modified no-fault system, with some additional benefits. That plan is now in effect and we are seeing some interesting results. Not enough results are in yet to make a valid observation, I don't think, about the extent to which it meets the problems. But I think it is an excellent opportunity for us to gain some experience.

It is my understanding that in the State of Florida there is a very good opportunity that some form of no-fault bill will pass, which is much different than the one in Massachusetts.

Mr. SUTCLIFFE. Let me stop you right there, so I can understand.

I guess in any kind of experiment you will set it up and design it in such a fashion as to be able to test the results. Have the Massachusetts proponents of no-fault set up through their insurance regulatory mechanism or whatever a procedure whereby they can test the validity of their experiment, where they can get the information that would be useful from an experimental point of view, and if so, could you describe some of that for the committee?

Mr. WORTHINGTON. You are talking about—

Mr. SUTCLIFFE. Do you understand what I mean? In other words, you are saying there appears to be some beneficial results from an experimentation program in Massachusetts. What specifically has Massachusetts done to insure that the information which is coming out of Massachusetts about their plan has validity, measures costs, measures savings, measures redistribution of benefits to improve the problems highlighted in the Department of Transportation study?

Mr. WORTHINGTON. If you are asking was part of the program in Massachusetts a program that would require surveillance and analysis of statistics that might be developed to see how it works, I don't think that it was. There is no business, however, that I know of in the country, that generates more statistics and that has more adequate information about how it functions that are available to both the regulators and to the public, and my observation about the fact that it is providing some information that is interesting and shows it may be beneficial, is based on some of the statistics it has generated.

For example, one of the very interesting ones there has been the fact that there are fewer claims being filed now for physical damage.

Mr. SUTCLIFFE. We have had two explanations, you see. This is the reason I ask the question. Because if the approach to allowing for experimentation is going to be followed, then it seems to me that it is natural to ask what methods of collecting these statistics and validating those statistics are being provided.

We have been told by one group that the decrease in claims in the bodily injury area is a result of the constitutional test, and that the lawyers are simply holding back hoping that the constitutional challenge will be successful.

In another instance it has been explained to us that because of the unique situation in Massachusetts, many of the bodily injury claims reflected property damage claims, because it was a mandatory State

Now it seems to me that if we set out to experiment on a State-by-State basis, apart from whether or not that is a practical possibility, this committee would like to know what assurances we will have that the results from those experiments will produce meaningful information to other States or to the Federal Government in its analysis of the reform.

Mr. WORTHINGTON. I think you are asking is there going to be some supervisory person to look at it to see whether there are meaningful results?

Mr. SUTCLIFFE. Or is the NAIC itself recommending this kind of procedure to the States?

Mr. WORTHINGTON. One of the functions which I currently serve in in the NAIC as chairman of a committee called the Committee on Profitability of Liability and Property Companies. This committee is attempting to look and see what sort of things go into the determination of rates for insurance companies and how much money is sent back to the consumer, how much is generated as a result of their investments. And this kind of committee function in the NAIC will very well, I am sure, sort out the actual statistical and practical profit and public interest items that will result from the experimentations in the various States.

So I think I can say unequivocally that the NAIC, if the States continue to experiment in this manner, will watch closely to see what happens.

We have discussed briefly about whether we should attempt to design a model bill. And it is not an official policy of the NAIC, but the officers have generally agreed that at this point we should not try to design a model bill, but that rather we should observe what the different States are doing and collect the data about the effectiveness of their operations, and after a period of time then put the portions of their program which seem to work most effectively into some model guidelines that could be used by the States that are interested.

Let me go on a little bit about the experimentation. I would say the New York proposal is different than any other State proposal. Illinois has a plan before its legislature.

Mr. SUTCLIFFE. Does it differ, because it suggested that it could be done at either the State or Federal level?

Mr. WORTHINGTON. No; I think it has a completely different thrust, for example, than the one in Illinois or Iowa, because it basically does away with the tort system.

Our proposal is to preserve it, but give first-party coverage in all instances and let the insurance companies subrogate. I have said in the past and would say again that though my plan in Iowa is substantially different from the one in New York, I would hope New York would adopt their bill and give us a chance to gain some experience as a result of its operation.

I would hope Iowa and Illinois would adopt their bills, so we can compare our experience too.

Mr. SUTCLIFFE. To that point then, what mechanism would you create to monitor the cost benefit differences between the Massachusetts plan and the Illinois or Iowa plans? The cost differences, for example, between an inter-insurer subrogation provision or a cost offset provision, differences between, in Massachusetts, the \$500 medical payment

entry into the tort liability system and in Illinois, no entry provision, but a limitation on intangible loss recovery once tort is entered and an offset for any mandatory first-party coverages? How are we going to get the data to analyze that kind of difference?

Because if we are going to experiment, and the argument is we will learn from experimentation, it seems to me we have to be assured we will be able to get that kind of information back.

Mr. WORTHINGTON. I think I can assure you the NAIC in its normal functions will be gathering this data through the work of its committees, through the analysis of the reports that are filed now with the insurance departments, and which are, some of which are created by private organizations.

Mr. SUTCLIFFE. Is that information oriented toward answering the kinds of questions that are being asked now, or is it more oriented toward a business operation within the existing liability system focus?

Mr. WORTHINGTON. The data we would collect, I would anticipate, would be data that would answer the questions we wanted to ask.

Mr. SUTCLIFFE. So you would have to go through some kind of reformulation.

Mr. WORTHINGTON. If the standard reporting techniques we have now are not adequate, we can easily change them to make them adequate. What I am saying basically, I suppose, is that we think we have a system set up now which could gather the information. If it doesn't, then we can modify it.

Mr. SUTCLIFFE. Will you undergo an examination of that prior to the time of finding out that it doesn't produce the information? I mean are you presently engaged in analyzing your reporting system to make sure that it does the job or will you soon be engaged in that endeavor?

Mr. WORTHINGTON. As soon as we know whether or not the Congress is going to allow us to experiment, we will immediately begin the procedures to comply with the stewardship that you have given us. I think our past record in the past few years in the NAIC at least, is indicative of the fact we will do an adequate job.

Mr. SUTCLIFFE. As to a more basic question about the need for experimentation, how much experimentation was undertaken to test the postinsolvency assessment plans that you have advocated be adopted and have been quite successful in getting adopted in many jurisdictions in this country? When you promulgated that model bill how much experimentation with that system had been undertaken before you set it in concrete, so to speak?

Mr. WORTHINGTON. Before we promulgated our model bill I think there were some six or seven States which already had a form of insolvency fund or form of guarantee fund, and we drafted our bill based on the experience that those other States had had over the past years.

Mr. SUTCLIFFE. Those were all preassessment plans, were they not?

Mr. WORTHINGTON. No; there is a plan like the one in New Jersey, I think—or was it Maryland?—Michigan and California had adopted before our model postassessment plan. One of the things that led us to try the postassessment approach was the experience that they had had with the preassessment plans, and the experience with preassessment plans was such that we felt that was not the proper way to go.

MR. SUTCLIFFE. You mentioned your organization also includes members of the territories of this country. I noted that with interest. Have you had an opportunity to receive the views of the regulatory authorities from Puerto Rico and had a chance to evaluate that particular experiment?

MR. WORTHINGTON. The insurance commissioner from Puerto Rico regularly attends our meetings and participates in our committee functions, and he is very vocal about his experiences in Puerto Rico and feels that it is an excellent program for his territory. He is an active participant.

MR. SUTCLIFFE. Have you come to any conclusions based upon the experience in Puerto Rico as to any recommendation the NAIC would make to States who are going to undertake experiments in reforming their automobile compensation system?

MR. WORTHINGTON. I think it is too early to draw any valid conclusions about the Puerto Rican situation and recommend them to other States on an official basis. Obviously most of us that are interested in it are going to look closely at it because it is an operating one, just like we will the Massachusetts plan.

Senator Moss. Thank you for excusing me for a short time, and I am sure Mr. Sutcliffe has had a number of questions that have occurred to us in listening to your testimony. One thing I wanted to ask, Mr. Worthington, is, you referred in your statement to the danger of an ill-considered national program for insurance reform. Given the Department of Transportation's study and the extensive congressional hearings, do you really think this—it is ill considered to have a bill of this type before us now?

MR. WORTHINGTON. I suppose if I were to give a definition of what I mean by ill considered it would have to be something like this, that any proposal which would change the system which has been in effect as long as the tort system has been in effect in the United States without some measure of experimentation or some trial of a new system on a national basis would have to by definition, be ill considered.

We are not indicating that you have not studied it long enough or that learned people have not given their opinions, but rather we are just saying that by the very extent of the enormity of the program it ought to be tried someplace before it is put forth for the whole country.

Senator Moss. Well, I wonder about the parallel between automobile insurance and health insurance. The administration recommends the State regulation in automobile insurance but recommends a national system of health insurance; why should one be treated one way and the other the other?

MR. WORTHINGTON. We are trying to help them become consistent, Senator.

Senator Moss. Which way?

MR. WORTHINGTON. In favor of the State.

Senator Moss. I was, of course, pleased to note that you recognized that there needs to be changes and there was a great change going on in the industry. Isn't it true that it is less likely that you can get a change effected in all of the State legislatures? State legislators serve for a minimum period of time, and they are all employed in other lines of employment, and, as has been said, they are subject perhaps

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate, and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have an easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a great addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and territories of the United States.

I shall deal with each of the matters before your Committee separately and start by giving my comments on the Uniform Motor Vehicle Insurance Act and Administration's proposed Concurrent Resolution.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the Administration has tentatively endorsed the no fault concept, it has concluded that "mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform: and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable."¹ The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault upon non fault "is an issue involving wide spread ramifications far beyond the traditional confines and insurance regulations . . .

"The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy."

"Thus NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."²

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Let me add parenthetically that I personally favor the adoption of no fault laws on a state-by-state basis and that I think the need for such laws is of great urgency.

¹ House Concurrent Resolution 241, 92nd Congress, 1st Sess. (1971).

² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Automobile Insurance Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and respond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in the sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objectives.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently

³ See DOT, *Motor Vehicle Crash Losses and their Compensation in the United States: a Report to the President and Congress 101-111* (March 1971) (hereafter cited as the DOT Report).

ard for determining liabilities which arise out of matters of common usage.

Like other activities to which the law has applied a strict liability standard, the operation of motor vehicles is an activity which can be defined with precision that makes it possible to establish it as an accounting unit. Accident rates and loss experiences can be, and have been, determined, making it an insurable activity. Moreover, those who have the money to purchase and operate automobiles can afford and should be required to purchase insurance. As with other activities to which the law has applied a strict liability standard, its use with automobiles would have the desirable effect of passing the inevitable costs of the activity on to those who benefit from it.

To summarize what I believe I have demonstrated, strict liability is a rule of the common law which has been applied over the centuries on an eclectic basis, depending upon how well it served the needs of society at the time. It is not the vestige of a primitive age, but instead is equally the product of an attuned and sensitive age, which has found the rule appropriate to modern conditions. Upon an overall appraisal it seems that it is the most desirable rule for assessing responsibility and providing compensation for automobile accidents.

DAMAGES: PAIN AND SUFFERING AND THE CONCEPT OF CATASTROPHIC LOSS

Critics of no-fault automobile insurance schemes frequently ascribe to those schemes the fixed and outdated schedules of allowances for injuries established by workmen's compensation statutes. They argue that the fault system utilizes an individualized and particularized measure of damages, which gives a refined and humanized justice. In particular, they argue that the damage rules used with the fault system are more desirable because they recognize and attempt to compensate for pain and suffering and disfigurement, which usually are not items of damage under workmen's compensation schemes.

Of course all these items of damages could be incorporated in a no-fault system if they are considered desirable and if we are willing to pay for them. The rigidity in damage allowances attributed to no-fault insurance is a rigidity manufactured by those who oppose the adoption of such a system rather than a rigidity which inheres in no-fault. The question is then how should compensation be determined under a no-fault system.

The Hart-Magnuson bill avoids much of the charged rigidity with its provision for awards of economic losses based upon the monthly earnings of the person injured. I agree with Dean Roddis of the University of Washington School of Law, who appeared before the committee last week, that it would probably be better to set a limit higher than the \$1,000 per month maximum established in the current draft of the bill, and to compensate for economic losses occurring over a longer period than 30 months. Indeed, as I shall develop later, I would allow recovery for all economic loss on a no-fault basis instead of relying on the traditional tort remedy as the bill now does.

I also believe the definition of earnings should be revised so as to permit computation upon the basis of probable future income rather than the actual income earned at the time of the accident in order to take care of those persons, such as students, who would probably have

had a substantial increase in income but for the accident. If the period of time for which compensation for economic loss is given on a no-fault basis is extended to 4 or 5 years, it would also be appropriate to give consideration to the fact that wage and salary rates will probably rise during that time.

As a technical matter of drafting, I think the bill might be improved upon by addition of a statement more clearly establishing that compensation in cases not involving death be made on an installment basis and that in death cases economic loss shall, or shall not, be reduced to present value.

I might interject a few words about collateral source rule that was mentioned earlier this morning.

It would seem to me there is nothing wrong with the provision in the bill taking advantage of the fact that there are other insurance schemes. I do not believe it is correct to say that the bill would allow the wrongdoer to have the benefit of the group health or medical insurance which the injured person buys. It is not the wrongdoer who is going to get the benefit, it is another insurance company that is going to get the benefit. Under our present scheme, the wrongdoer is not going to be sued unless he was insured. And even if we do come to—I would make a distinction, first, between those things which are insurance and those things which we should consider as assets of the plaintiff.

For example, a workman who is required to take sick leave, thereby reducing the amount of sick leave which he has in his bank, sick leave most certainly should not be required to do that. But if it is Blue Cross or some kind of medical coverage, I think we should certainly accept the hypothetical bill as drafted.

One of my classroom hypotheticals which I use with students who say you are allowing the wrongdoer the benefit of what the plaintiff bought, is, suppose the plaintiff were a man who had taken a first-aid course, and he had learned how to apply a tourniquet, and in an accident one of his arteries was cut. Suppose he manages to put the tourniquet on and therefore he doesn't die. Other people would have died if they hadn't known how to do it. Are we going to say he was entitled to recovery for wrongful death, because other people would have died? They wouldn't have had the foresight to take the course to prepare themselves for the possibility of the accident in the way you did? No. And I think the analogy is sufficiently strong to say the same thing is true for the person who has had the foresight to take out an accident insurance policy or medical and accident insurance policy.

The most controversial part of the bill is that now found in section 4, which preserves the traditional tort action for cases of catastrophic injury. Personally, I would be willing to substitute no-fault for all harm caused by automobile accidents, and limit the compensation to economic loss. The hybrid systems of no fault with a limited tort recovery have a political appeal, and defuse some of the arguments based upon cases involving disfigurement and much pain. But I believe the preservation of the tort remedy is inconsistent with the findings which led to proposals for adoption of no fault insurance.

It is probably a startling proposition for the professor of tort law to state that there is no sense to the awarding of damages for pain and suffering in automobile cases. But I believe that objective considera-

tion of the matter leads to the conclusion that in giving damages for noneconomic losses we are trying to make money do what money cannot do, make insurance companies' money do what many insurance companies cannot do.

We know that there is no market for pain, and the attempt to assign a dollar value to it is doomed to failure. Likewise, in cases of disfigurement, after we have done everything that can be done with medical care, I doubt that payment of money makes any sense.

Remember that the money paid in a case of disfigurement is almost certain to be the money of an insurance company and, hence, the money of the insurance-buying public. It is almost certain not to be the money of one who has been determined to be at fault. And no amount of money can undo the disfigurement or constitute adequate compensation for what has happened.

In discussing whether it makes any sense to award damages for pain and suffering or disfigurement. I am sometimes reminded of the accounts given by anthropologists of a practice of the natives of the New Guinea highlands. The New Guinea highland people live in a stone-age economy, subsisting primarily upon the many varieties of sweet potato which they grow and the few wild pigs which they catch.

If a person is killed, particularly if he is killed in battle, other members of the village express their condolences with the family in what seems to us a ghastly way. They cut off and send to the bereaved family fingers of little girls.

We ask what sense this could possibly make—how can the bereaved family any better support their loss because of fingers taken from little girls who had nothing to do with the death?

I suspect, however, that if we could get a sufficiently sophisticated New Guinea native, he might ask us what we thought we were accomplishing by giving money to compensate for pain and suffering or disfigurement.

He might also point out to us that they carefully select the ring fingers of girls so as not to interfere with their later productivity, and he might ask us if our use of pain and suffering damages does not prevent us from giving compensation for all economic loss suffered by victims of automobile accidents.

I suppose that in both cases we have an expression by society of its concern for what happened to the individual—a tangible demonstration of our concern.

I share that concern for what happens to members of our society, but I question whether the fault system is the best system for expressing that concern, considering that it bars or fails to provide compensation in such cases as well as permitting it.

I think that we are better able to show our concern if we proceed on the basis of asking no more than whether it was an automobile which caused the injury before we provide all that can be done by existing medical treatment.

True, it would be nice if we could do more in a tangible way, but not nice enough to lead me to believe that we should do it rather than provide compensation for all economic harm on a no-fault basis.

I would therefore strike from section 4 of the bill that language which preserves the common law tort action for cases of catastrophic harm and from section 7 that language which establishes a time limit

on the amount of earnings which can be included in the computation of economic loss.

Of course, if these purist views of a supporter of no-fault cannot be incorporated in the bill, I would give my support to the definition of catastrophic harm and the limitation which it imposes upon damages for pain and suffering.

Senator BAKER. Before you go on, may I ask a question on the other subject?

Do you feel, and does your statement imply, that the insurance industry in one way or the other could support the cost of strict liability no-fault insurance without limitation as to amount?

I am not implying anything. I just want your point of view.

Mr. PECK. I obviously have to make something of a guess. But I believe it could. A large part of the insurance expenditures are those made on the small claims where the economic loss is relatively small and the claimants receive in the settlements three, four and five items the amount of their economic loss. I think the reason for the overpayment is that under the existing rules it makes sense for the insurance companies to buy up that claim.

Senator BAKER. I understand that. But do you have any supporting data on the number of claims that are made and not paid, whether barred by contributory negligence or failure to sue or whatever. Do you have any basis for judging the total cost if we had no-fault without limitation?

Mr. PECK. I do not have them with me now. Dean Leon Green, who wrote one of the pioneering books on no-fault, did estimate that this could be accomplished. I think that Professor Conard's study at the University of Michigan would indicate the feasibility of this. I don't think that his study has a chapter or section devoted directly to this.

Senator, the studies of the insurance industry indicate that contributory negligence very seldom bars recovery. Most insurance companies will pay something even if they think their insured was only one-half at fault. And, for certain categories of cases, such as death, the studies indicate that they will make a payment even though they think their person had no fault at all. That makes sense, buy it up if you can.

Senator BAKER. I understand that. All I am after is a more narrow response and that is if you have any estimates of cost if we had no-fault and no limitation as to the amount of potential recovery.

Mr. PECK. I do not have those. Dean Leon Green did do the work and he reached the conclusion that it could be done.

Senator BAKER. My question was as to whether the insurance industry could cover these costs; your answer, as I understood it, was it could.

At some point I would like to explore whether the insurance industry could cover these costs; your answer, as I understood it, was it could.

At some point I would like to explore whether it should, which is a question I put to another witness, on whether or not we ought to broaden the base of support of these social obligations beyond just the operator of the motor vehicle.

Mr. PECK. Well, that might be. But, as I attempted to develop in the first part of my presentation, I believe that automobile accidents present a classic case for the use of strict liability. If we take another example, take the difference between rotary lawnmowers and reel lawnmowers.

Senator BAKER. Excuse me. It is late and I am imposing on the chairman's patience by putting these questions. So let me save the rest of it until later.

Mr. PECK. I am sorry. Let me go to the problem about Federal intervention.

FEDERAL INTERVENTION INTO REGULATION OF THE INSURANCE INDUSTRY—
STATE EXPERIMENTATION WITH NO-FAULT INSURANCE

As I understand it, one of the major objections to the Hart-Magnuson bill is that it would involve the Federal Government in the regulation of the insurance industry, a subject which until now has been left largely to the State governments.

I have an appreciation for the value of local government, an appreciation which was heightened by my study of the highly centralized legal and governmental system of the Philippines. But I believe that the problem of no-fault automobile accident compensation is one which can be dealt with sensibly only on a Federal basis.

We have until now been able to get along with a system which depends upon State tort law because that law had a uniformity drawn from English common law. Even so, the amount of interstate travel has produced enough complications because of the differences in State law to provide very difficult and interesting cases for casebooks on the conflict of laws.

I believe that the statistics compiled by the National Safety Council will show that about one-seventh of the fatal accidents involve drivers who were not residents of the States in which the accidents occurred, and that about one-twelfth of all accidents involve drivers who were not residents of the States in which the accidents occurred.

The higher ratio with respect to cases involving death probably reflects the high rate of speed of automobiles in interstate travel.

If we are now to embark upon a program of legislation of no-fault schemes, the absence of a single and agreed-upon model from which a draft is made insures that the result will be a tremendous confusion concerning which law governs and what system of compensation applies.

Given the amount of interstate travel involved and the interstate character of the insurance business, there is in my mind no doubt that the subject is an appropriate one for Federal regulation.

While I would worry as much as anyone about a camel's nose appearing in the tent, I can take consolation from the fact that icebergs still float with only a fraction of their bulk appearing above the water.

It is the nature of the problem and not the simile suggested which should determine the proper course of action.

It is suggested, however, that the subject should be left to the States so that we may have the advantages of 50 laboratory solutions to the problem and thus come up with what is the best system.

I should like to point out that a similar argument could have been made concerning the insurance scheme we know as social security, and that the history of social security in this country does not indicate that experimentation, change, and improvement need end because the statute enacted is Federal.

I would also point out that what we have permitted with respect to experimentation by States has sometimes resulted in State adherence to laboratory results which are clearly undesirable.

I refer, for example, to matters such as unemployment compensation and welfare, in which I believe the disparity in the level of benefits cannot be rationally defended, though it continues to persist.

More important, I have considerable doubts that the experimentation will take place, even though Massachusetts is currently providing us with one model of a no-fault system.

In an article which I published in 48 *Minnesota Law Review* 265 (1963) on the "Role of Courts and Legislatures in the Reform of Tort Law," I investigate the operation of State legislatures.

Generally speaking, State legislatures are composed of underpaid, part-time legislators, meeting for short periods of time, perhaps once every 2 years, working under unsatisfactory conditions and without adequate supporting staffs.

They are, I believe, particularly susceptible to the pressures of lobbyists, who, with considerable frequency, prevent the enactment of reforms.

Particularly is this so with regard to reform of tort law, because the opponents of reform—insurance companies, manufacturers, apartment house owners, et cetera—are well organized and capable of lobbying against reform, whereas the victims of notorious conduct are seldom organized or capable of lobbying for reform.

The conclusion which I reached—and, incidentally, it is the conclusion which Professor Keeton of the Keeton and O'Connell plan has reached—is that the area of tort law is one in which judicial activism is particularly appropriate.

The same analysis leads me to the conclusion that if interest in problems of tort law with interstate dimensions can be organized at the Federal level, the problem is one for Federal activism.

Consider what will probably happen with respect to those proposals of a no-fault system introduced into State legislatures. They will be met with the combined opposition of both plaintiff's and defendant's bar, as well as the opposition of some insurance companies.

I suppose that some companies engaged in transportation may also find it worthwhile to lobby against the no-fault proposal.

Lawyers in the legislatures will be quite friendly with the lawyers from "both sides" appearing before them.

Who will lobby for it? There is no organization or lobby of the victims of automobile accidents, and I do not expect one to be formed.

The problem is sufficiently complicated that the busy part-time legislator, lacking the assistance of an adequate staff, may easily conclude that the case for change has not been made with sufficient clarity.

I suppose a few might also think in terms of the effect of their vote upon the campaign contributions they will need for the next election.

The result will be either no action or, as happened in the State of Washington, reference of the matter to a council for study.

I believe that the draft of the Hart-Magnuson bill shows the expert work and understanding of your committee staff. I believe—or at least I hope—that you have heard enough about the problem of automobile accident compensation to know that a change must be made from our existing insured-fault system.

While I would like to see the bill embrace the no-fault concept to the exclusion of all tort liability, I believe enactment of the bill would be a substantial improvement in our law. I recommend that action to you.

Senator Moss. Thank you very much, Professor Peck. That certainly is a scholarly and well thought out paper, and one that impresses me considerably knowing you are in the field of torts, and knowing you know all of the ramifications of tort actions.

I was particularly interested when you talked about the pain and suffering and disfigurement angles of damages.

Is there any medical measure that has ever been developed on pain and suffering to evaluate it?

Mr. PECK. None that I know of, sir. I have talked to the neurologists of the University of Washington, in fact I have had them come to my torts class to discuss pain and we learn a little bit about it.

Pain, for example, exists only when tissue is being destroyed or irritated. When it has been totally destroyed, there is no more pain.

The pain which people suffer depends a great deal upon their psychological problems and varies tremendously with what the factors entirely unrelated to the injury which causes them to suffer pain. By that, I mean that the persons who has many problems in his life may be looking for sort of a trashcan into which he can throw all of the things that bother him. If he once gets that pain, that little tingling in his arm that perhaps is the remnants of a whiplash, for that person—that is the wife he doesn't like, that is the job he doesn't like, all of the things that have troubled him can now, somehow, get located in that terrific pain he has got there.

There is a tremendous variation in the amount of pain which people report to their doctors and in situations which the doctors think physiologically the pain should be the same.

Senator Moss. I ask that because I had a friend who was an insurance adjuster, and he used to tell me that if he got a case where he had pain in the sacroiliac, he just bought it at any price he could get, because there was no end to it. It never could be measured, and it was all subjective, and the thing to do was just get it settled at any cost.

And it seems to me that is what you are saying about the general concept of pain and suffering. It can't be measured, and besides, it isn't lessened at all by turning over a given number of dollars.

Mr. PECK. I would suppose if we provide, as the bill does, for all of the medical treatment that can be given to alleviate the pain, if there is still pain being suffered, I doubt very much that there can be any enjoyment of money at that time. And when it is over, something very bad has occurred, but it doesn't have a dollar value.

Senator Moss. Following up what Senator Baker had asked you earlier—by the way, he had to leave because of an appointment, and he wanted me to express his apologies. He did want to remain.

But, I understand that you suggest by your testimony that our society has become sufficiently affluent that we can afford a system of compensation that focuses on the individual and could cover all loss.

Is that right?

Mr. PECK. Yes.

Senator Moss. And you would not have any limitation on the length of time of treatment or loss of wages? You would have it extend as long as the person was actually prevented—

Mr. PECK. I suspect the provisions in the bill establishing a top-dollar limit does make some sense. I suppose most of those people who have a very high income level have probably taken out their own in-

insurance scheme for the cases of catastrophic loss of income-earning capacity.

But, I do think, given the income levels in the United States today, and what we can expect them to rise to, that the maximum of \$1,000 a month is too low.

My proposal is that we allow recovery without regard to the length of time for economic loss, and I am not suggesting that there should not be any limit on the amount that could be recovered each particular month.

Senator Moss. To what extent would you have access to the courts available to settle administrative disputes, for instance, as to the amount, for instance measuring the amount, the number of dollars for any particular medical procedure, anything of that sort?

Do you envisage any way there could be a settlement where there was a disagreement between the recipients and the administrator?

Mr. Peck. Oh, I suppose that the settlement process will be and should be used for most cases, as it is today. I suppose that we have also got to have a system in which ultimately, if there is disagreement, there will be judicial review.

In that respect, if we do provide a system in which the claimant, who disagrees with his insurance company over the percentage of his disability, is able to go to court, I suspect that some of the fears of practicing lawyers that they will not have any business, may be misplaced. If everybody injured is able to make a claim, not simply those who are able to prove fault on the other party's side as well as freedom of fault on their side there will probably be more claims and perhaps more disputes about exactly how severe the injury was.

It is also my impression that a good deal of the litigation, time spent in litigation under the tort system, does not relate to fault.

A good deal of it relates to how seriously was the victim injured, how permanent will his injuries be, and how incapacitating are they?

Those are things which I don't suppose we can eliminate.

Senator Moss. You are not fearful this will put all of the lawyers out of business then, if the bill is passed?

Mr. PECK. No, it is an old joke about the legal profession, that for every solution, there are problems.

Senator Moss. Mr. Sutcliffe has a question or two he wants to ask you.

Mr. SUTCLIFFE. Professor, in examining the thrust of your statement related to strict liability, you mention the way in which the strict liability rule has predominated, that we have adjusted over time for the negligence action, that we still had strict liability when we switched primarily to a negligence setup.

You also mention in your analysis that change in the tort law through a State legislature was a difficult process to accomplish.

I think the question that must be posed because of the statement that you have made today, is why don't we rely upon the judiciary to determine that the strict liability rules now apply to automobiles?

Let's assume that if we did rely upon the judiciary to make this determination, would it have a palliative effect on the present problems in our compensation system, since it is still a liability scheme, and not in any way demanding first-party coverages?

Mr. PECK. Well, of course, as I mentioned, the judiciary has done this with regard to products liability, or is in the course of doing it,

throughout the Nation. We are adopting strict liability for that problem.

I suspect there is a greater difficulty with automobile accidents in the matter of limitations which can be imposed upon the total liability, which we were just talking about.

If a court makes a change to some kind of a rule of strict liability, it can't set the limits such as the \$1,000 or \$1,500.

Mr. SUTCLIFFE. Let me stop you there and see if I understand you.

You are suggesting that the judicial mechanism can change its legal rules, but cannot change the insurance rules?

Mr. PECK. That is right.

And if the judiciary were to make the change, there would be many people owning automobiles, which have insurance policies written on the fault theory. They would be totally unprotected from the liabilities which the judiciary would impose upon them if it adopted the strict liability standard.

The change can be made so much better in a legislative way, in the way this bill proposes, requiring that insurance policies be written in certain ways to meet the problems. The judiciary could not do that in making the change in its rule of liability.

Mr. SUTCLIFFE. I appreciate your comments on that point.

Would you oppose the awarding of intangible loss recoveries on a first-party basis, assuming that there is a palliative, if not a corrective effect in the giving of money or the extending of the fingers of small children?

Mr. PECK. As I said, that can be made a part of a no-fault system. There is no reason why the noneconomic losses can't be part of the damage.

Mr. SUTCLIFFE. As a person with arbitration experience, would it be appropriate to submit this kind of determination to an arbitrator?

Mr. PECK. A good deal of that is done now with the insured motorist coverage in the standard policies.

It could be done by arbitration, certainly, I suppose, and indeed the present bill, I suppose, would permit the insurance companies to add coverage of that sort if the person buying the insurance wants to get it, or if he wants to get it for himself and the people riding in his car with him. I believe the present bill would permit the insurance companies to add that as an additional kind of insurance, which he could purchase if he wants to purchase it.

Mr. SUTCLIFFE. On an optional basis?

Mr. PECK. Yes.

Mr. SUTCLIFFE. In discussions we have had before this committee, there has been some suggestion that if we are going to fulfill a social function, we should put it on a basis larger than the automobile user.

My question to you, given the testimony that you have presented here about the wide use of automobiles, do you think that there would be a significant difference between a premium assessment, or a tax upon the automobile user as distinct from the general taxpayer?

Mr. PECK. Well, I think your question leads to what has been so well explored by Professor Calabresi of Yale Law School. He points out that one of the things that we should strive to do with the rules of law that we utilize is to establish a cost accounting system which makes

the American public realize how much they are paying for any particular product, and how much any particular activity costs.

To the extent that we have a general socialized accident or insurance scheme, we may end up making uneconomic decisions.

If we take an activity which can be an accounting unit and make it responsible for those accidents caused by that activity, we then price it and then people know what that activity costs them. Automobiles, I think, are different from a good number of other things.

One of Professor Calabresi's hypotheses, which I was going to mention to Senator Baker, is the difference between reel lawnmowers and rotary mowers. Reel mowers are much safer than rotary lawnmowers. But, when the customer goes into the store and he looks and he sees the higher price on the rotary lawnmower, he decides to buy the reel.

If he were really going to be getting the same thing, he should also buy an insurance policy for the additional harm that he might get from the rotary lawnmower.

And Calabresi's suggestion is we should try to have a system of law so that when a customer buys, he will make an informed and wise decision. The difficulty with lawnmowers is illustrated by the problem caused when the rotary lawnmower hits a glass beer bottle, and the flying glass cuts someone. Is the cost one, then, that goes to the rotary lawnmower industry, or the glass bottle manufacturers?

I think we can avoid that problem with automobiles because as I have suggested, they are an activity which can be defined with precision, and we can make it an accounting unit. And I don't think we can end up feeling there is any great injustice that comes from attaching responsibility for all of the accidents which occur to that activity.

Mr. SUTCLIFFE. Thank you very much, professor.

Senator Moss. Thank you, Professor Peck. It has been a very interesting and stimulating paper that you have delivered to us, and we appreciate your coming to present it to the committee.

Mr. PECK. I thank you very much for the opportunity.

Senator Moss. This committee will now stand in recess until 2 o'clock, when we have two very excellent witnesses to hear.

(Whereupon, at 12:20 p.m., the hearing was recessed, to reconvene at 2 p.m., this same day.)

AFTERNOON SESSION

Senator Moss. The committee will come to order.

We will resume our hearings on S. 945, S. 946 and S. 976 and Concurrent Resolution 23.

Our first witness this afternoon is Mr. Lorne Worthington, insurance commissioner of the State of Iowa. He will be making his presentation on behalf of the National Association of Insurance Commissioners.

We are very glad to have you, Mr. Worthington. I see you have a very well prepared and rather thick document here. I hope there will be ways of summarizing and highlighting that.

STATEMENT OF LORNE WORTHINGTON, INSURANCE COMMISSIONER, STATE OF IOWA, AND PRESIDENT, NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS; ACCOMPANIED BY JOHN S. HANSON, EXECUTIVE SECRETARY-DIRECTOR OF RESEARCH; AND ROBERT E. DINEEN, CONSULTANT

Mr. WORTHINGTON. Thank you, Senator. I will attempt to summarize it.

Senator Moss. Thank you, sir. Would you identify the gentlemen with you?

Mr. WORTHINGTON. I would like to identify the gentlemen with me. On my right is Mr. John Hanson, the executive secretary of the National Association of Insurance Commissioners. On my left is Mr. Robert Dineen who is a special consultant to our organization.

Senator Moss. We welcome you.

Mr. WORTHINGTON. My name is Lorne R. Worthington. I am appearing today on behalf of the National Association of Insurance Commissioners, which is commonly referred to as the NAIC. I am here both as insurance commissioner of Iowa and as president of the NAIC.

NAIC, for the record, had its inception in, and regular meetings since, 1871. The NAIC is the oldest voluntary association of State officials. It includes among its members the principal insurance regulatory authorities of the 50 States, the District of Columbia and the territories of the United States.

I will attempt to deal with each of the matters before your committee separately and start by giving my comments on the Uniform Motor Vehicles Insurance Act and the administration's proposed concurrent resolution.

Because our views on this matter are relatively well known, for summary purposes I am going to turn to the summary of our statement and read that at this time rather than go through the statement in any great detail, and then I will be pleased to answer any questions you might have in reference to the statement during the question period.

Senator Moss. Thank you. The statement will go in the record in full in its regular order, and, so you may be sure it is a part of the record, everything that you have presented here.

Mr. WORTHINGTON. Thank you.

The basic issue with which we are confronted is the appropriate means to test and/or implement the no-fault concept as it applies to motor vehicles insurance.

Whether or not this concept or some variation should be adopted is a question of public policy which extends beyond the traditional confines of insurance and the regulation thereof. Whatever the decision, however, the State insurance departments have and continue to be prepared to regulate in the public interest.

The whole question involves a host of complex factors, conflicting objectives and a multiplicity of alternatives. As the DOT report documented, the public attitudes, and understandably so, are confused and mixed.

As a consequence, the NAIC opposes the enactment of the proposed no-fault legislation on a Federal national level and recommends experimentation on a State-by-State basis to resolve the problems posed in a manner responsive to the public's choice in the marketplace re-

flecting its balance between benefits it wants at costs it is willing to pay.

A congressional mandate as to mandatory and uniform coverage would destroy flexibility, freeze in error, and preclude choice and self-determination.

Massive Federal involvement, particularly in light of the substantial cost implications, would seem to be premature.

Similarly, we express reservations as to the establishment of specific Federal guidelines or objectives since these would prejudge what the market has not yet passed upon and would tend to inhibit the range of consumer choice.

These comments are not to argue for the status quo nor against the no-fault concept set out in the proposed legislation. We agree that some change is needed, although the extent is subject to debate.

The NAIC supports utilizing the State-by-State approach to ascertain the best plan or plans. This process is already well underway as indicated by the already extensive activity at the State level.

Furthermore, the NAIC opposes legislation which interjects an extensive Federal regulatory mechanism over automobile insurance. Such would create duplicatory regulation, confusion and unnecessary taxpayer expenses.

I would like to read a quote from the statement of position adopted by the National Association of Insurance Commissioners in 1969. This is included in the text of my statement, Senator.

Because factors, concepts, values and attitudes vary from local to locale, this public policy decisions—

That is, fault or no-fault—

would best be made on a state-by-state basis rather than at the federal level. This in turn affords the opportunities to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution or solutions will emerge. The NAIC therefore opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis. Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of the different populus in the several states.

The public, by its responses to legislation, and by the decisions it makes in the marketplace, in accepting or rejecting various coverages and services offered, will ultimately settle the issue.

Both Secretary Volpe's statement and the comprehensive DOT study clearly indicate that such intervention is not warranted so long as the States can continue to adjust to the changing environment.

Furthermore, the proposed statute with its mandatory uniformity and inflexibility would turn back the clock 25 years to re-create what the antitrust laws and the Senate Antitrust Monopoly Subcommittee have attempted to discourage these past many years.

In short, the NAIC endorses the administration's positions on experimenting with different approaches at the State level.

If Congress believes that some type of congressional action is necessary, we feel that the resolution approach is the most appropriate. However, the inclusion of specific Federal standards in such a resolution would be premature and would tend to inhibit the wide range of experimentation which it seeks to achieve.

On the other hand, the resolution could express the sense of Congress by pointing out the problems, taking cognizance of the various studies and conflicting objectives and calling upon the States, the industry, and other interested parties to develop and test solutions within a reasonable period of time, such as 5 years. Failure to do so could be construed as an invitation for Congress to undertake the task.

I might add parenthetically at this point, that should the States fail to act, I would personally seek opportunities to come and testify again before this committee and ask the Federal Government to move into an area which might not have been met by the States.

I am not suggesting that State inaction would mean forever inaction.

I would like to turn now to comments on group or mass merchandising. The proposed Motor Vehicle Group Insurance Act, S. 946, attempts to foster a legal climate in which automobile insurance could be marketed, free from various legal restraints.

To achieve this objection section 3(a) would prohibit any State from prohibiting, inhibiting, restricting, or conditioning the issuance and marketing of group insurance as defined by the statute. Thus, S. 946 poses two basic questions: One, the objective sought and, two, the means to implement the objective.

At this moment the NAIC position on mass marketing of automobile insurance is limited to a broad statement included in the statement of position adopted in June 1969, and we have brought a copy of that for you, Senator, if you would care to have it for the committee purposes.

Senator Moss. We would like to have that for our purposes. We will include it in the record by reference.

Mr. WORTHINGTON. Thank you.

I quote from that document.

The mass merchandising of automobile insurance has the potential of decreasing the dollar cost of auto insurance to the public. The savings may well be a mere transfer of the cost to either an employer or to the policyholder in the form of reduced services. True group auto insurance, separate and distinct from mass merchandising, may also offer a potential avenue to make the existing system function more smoothly. Both mass merchandising and group underwriting are currently being pursued under a variety of plans in various states.

The NAIC believes that a wide degree of experimentation will develop an array of alternatives and choices in the marketplace which will be consistent with the best interests of the insurance-buying public and the NAIC encourages such experimentation.

The subject is currently under review by our executive committee which has directed the NAIC central office staff to prepare a comprehensive report thereon. This report will be completed by our June meeting.

According to NAIC procedure, based upon this report and any other information submitted, the NAIC will adopt a specific position statement on the subject. When the staff study and position statement become available we will provide your committee with copies.

Thus, at this juncture, I cannot speak for the NAIC except in the broadest of terms. However, based upon my own personal experience in the Iowa Insurance Department and upon a reading of the first rough draft of the NAIC staff report, I can make the following personal observations.

I might add I have the first rough draft of the merchandising report with me, and though I will not refer to it directly, many of my views and conclusions have been generated as a result of the information I gained from a study of that draft.

1. THE GENERAL OBJECTIVE

First, as the staff study and the NAIC general statement suggests and, I believe, as a matter of general public policy the insurance consumer is entitled to the maximum choice possible, consistent with other goals of public policy, among the various competing alternative methods of distributing insurance which have a varying impact on the amount he pays and the services he receives.

This range of choice should embrace marketing not only by brokers, independent agents, exclusive agents, direct sellers (through salaried solicitors) and by mail, but also by various types of mass marketing techniques.

Whatever may be said for the reasons justifying the enactment of these early restrictive measures, that is, the need for "orderly marketing," the avoidance of unfair discrimination between different classes of buyers of the same form of insurance, apprehension about the possibilities of abuse inherent in a new form of merchandising, desire to protect the survival of the small agent, the insurance counterpart of the small businessman in whom Congress has long taken an interest, we think that with the passage of time and changes in conditions, that is the advent of sophisticated and widespread advertising through the printed media, radio, TV, public acceptance of the advantage of more competition, improved regulatory techniques, et cetera, the time is ripe to strike down these measures. Today they are an anachronism completely out of tune with the times.

After reviewing the various arguments made, pro and con, by various agent groups, company groups, government officials, and representatives of the consumers, I think it may be said that on balance the case for artificial restraints on marketing techniques lacks sufficient force to justify their imposition.

This is not to say that I advocate mass marketing as the panacea to the automobile insurance problem or that it is even better than the other marketing methods.

What I am saying is that the consumer and the public should have the opportunity to make its own choice and not be found by some governmental fiat one way or another. To this extent it would seem that both myself and the NAIC concur with the general objectives of S. 946.

2. IMPLEMENTING THE OBJECTIVE

In attempting to achieve the objective of an appropriate regulatory climate for mass marketing of automobile insurance, great care must be taken to avoid creating on the one hand a duplication of regulatory supervision or, on the other, a void in regulatory authority.

Federal action

As to the question of a need for a Federal mandate, the various insurance agent groups, and others, have historically opposed mass mar-

keting of insurance coverage. This occurred when group life insurance was introduced around 1911.

Various restrictions were designed to promote orderly insurance marketing. The proponents of these measures were seriously mistaken if they believed their efforts would permanently preclude the growth of group insurance.

As time went on there was increased understanding and acceptance of the benefits of group life insurance, and later group health and hospitalization coverages, by the man on the street.

Competition between insurance companies was a major factor in freezing up the market. Federal tax concessions also played a significant role. Employer and union pressures for the benefits of this coverage became manifest. The States and regulatory agencies responded to these developments.

The barriers began to fall away and today group coverage is readily accessible throughout the Nation. No congressional intervention aimed at restrictive practices was necessary to achieve this result.

History is now repeating itself in the property and liability field. Here too, restrictions, fostered primarily by agent groups, were established, for example, in the form of fictitious fleet laws and more recently the so-called guideline legislation.

Once again pressure mounted to abolish such artificial restraints: for example, the attorney general's opinion in Michigan, Governor Rockefeller's veto of proposed guideline legislation in New York, the Connecticut Supreme Court decision, increased critical scrutiny by insurance departments of existing and future regulations and legislation, et cetera.

Perhaps the most significant indication of the changing climate was the retention of Booz, Allen & Hamilton to study mass merchandizing by the independent agents themselves. This study has now been released and it makes plain that mass marketing of the property and liability lines is here to stay and to grow.

Cognizant of the fundamental changes and pressures which are emerging, the NAIC executive committee requested the staff study referred to earlier. Early review of the report by the NAIC is expected.

Since the tentative findings of the staff seem to be generally consistent with the changed outlook against burdensome restrictions on this form of merchandising, further remedial action by the NAIC may be forecast.

In short, the pressures for change stemming from changed economic, social, and political conditions coupled with an "increasing amount of information and awareness have already "loosened" the former situation. Change is already occurring and will continue as it has in mass marketing of life insurance without Federal legislation.

Incidentally, the problems faced by the State in this area are not unique. Agents are not the only groups who have sought to use laws or regulations to maintain or improve their economic position. Farmers and unions, to mention a few, have long sponsored legislation to improve their economic lot. Congress has adopted such legislation even though the effect was to increase costs for the consumer.

When the pendulum swings too far—as it does from time to time with all legislation with economic overtones—public pressures are cre-

ated calling for a redressing of the balance and legislatures respond. So it is and will be with mass marketing.

Thus the same public pressures are at work on the State legislatures as are at work in Congress. The question of whether a Federal solution is desirable, then, rests on three questions: (1) will congressional action bring a more rapid and desirable solution, (2) can Federal action be taken in such a manner as to adequately protect the total insurance buying public and at the same time not create burdensome and conflicting regulatory machinery, and (3) will congressional action be such as to not preempt or take precedence over State actions that may encourage experimental and pilot programs?

If the answers to the above three questions are all affirmative, then I personally have no objections to the enactment of such a piece of legislation.

S. 946 has some provisions in it that would, in my opinion, require some of the above questions to be answered negatively and therefore if Congress is to act in this matter, I suggest that the bill be amended to assure that it is more workable.

Section 3(a), for example, provides that no State shall prohibit, inhibit or restrict—by fictitious group laws, by agency licensing requirements or by application of prohibitions against unfair discrimination—the issuance and marketing of group insurance.

Such a provision would free insurers from all restraints thereby opening the door to potential multiple abuse. Although in the past efforts—probably well intentioned but conceptually faulty—have been used to restrict the sale of group coverages through a narrow construction of the unfair discrimination statutes as applied to expense differentials due to different marketing mechanisms, this does not mean we must go to the other extreme and emasculate all prohibitions against unfair discrimination.

Under this language Congress would declare open season for unfair trade practices totally unrelated to these interpretations restricting the use of mass marketing. The law of the commercial jungle would prevail. For example, the New York Insurance Law (sec. 213, par. 10) provides that: "No such (life insurance) company shall issue any life insurance or annuity contract which shall not appear to be self-supporting on reasonable assumptions as to interest, mortality, and expense." Among other things, this is designed to prevent the sale of "loss leaders." It prevents an insured from transferring the costs of an inadequate or unbalanced price structure from one group of policyholders to another and is a device to prevent unfair discrimination. S. 946 would appear to prevent provisions of this type at least with respect to automobile insurance.

Such a result can only be expected when one sweeps away all restraints over the conduct of commercial affairs.

Section 2 (2) attempts to define the "group insurance" to which the act would apply. Such an effort is subject to inherent flaws.

First, mass marketing is in its infancy. Various insurers and sponsoring groups are experimenting with different types of coverages, distribution mechanism—or eligibility—requirements, et cetera, to determine what best meets the needs of the buyer, those insured, and the insurers. To provide the imposition of a rigid Federal definition would

tend to freeze innovative efforts and retard the natural development of mass marketing to the detriment of the insured public.

Second. The definition is fairly rigorous against the freedom of the insurers to underwrite on an individual basis. As a consequence, especially in the incipient stage of mass marketing's development, insurers may be unwilling to provide mass marketed coverage, particularly to small and medium size groups which are particularly vulnerable to volatile loss experience. Thus, rigorous elements in the definition tend to discourage the very development of coverage the act is intended to assist.

Incidentally, it is interesting to note that agents groups have employed the rigorous definition approach in their so-called "guide line" statutes at the State level as a technique to inhibit the mass marketing development. Furthermore, insurers marketing insurance on a mass basis with elements not incorporated in the definition would not be helped by this act.

Third. On the other hand, a too liberal definition, coupled with the sweeping prohibition against appropriate regulatory controls, would greatly expand the potential for abuse as discussed above.

Fourth. After group life insurance was introduced, a major approach to restricting its use was the development of the group life definition in 1917. Since then, much effort has been expended to amend and reduce the scope so that group life insurance would achieve its full potential. The proponents of the mass marketing concept might keep this experience in mind before attempting to repeat provisions such as those in S. 946.

3. TAX TREATMENT

Although S. 947 providing favorable Federal tax treatment for group automobile insurance is before another subcommittee, it is part of the overall package. As such, reference should be made to it.

In my personal opinion, not speaking now for NAIC, in order to promote wide usage of group coverage, there must be a tax break given similar to the one now in effect for other group insurance coverages. There are obvious problems in adoption of such a law such as the discrimination against those who do not have access to an employer group and I suggest that you work to find some way to minimize this kind of discrimination. In spite of that problem, however, I personally endorse legislation like that proposed in S. 947.

DAMAGEABILITY STATEMENT

The third area of interest before you today that I want to discuss is the proposed Motor Vehicle Information and Cost Savings Act which would permit the Department of Transportation to set minimum standards for reduction of economic loss resulting from property damage to motor vehicles involved in accidents. To develop these minimum standards, and for other purposes, the bill would require DOT to prescribe certain tests to be performed on all makes and models, the results of which would be publicly distributed by DOT and auto manufacturers and dealers.

Among those receiving the results would be insurance companies. DOT would be required to report to the President and Congress

the subsequent use of these test results in insurance ratemaking. Comparisons in insurance costs by make and model would then be distributed by auto dealers. Finally, the bill would require DOT to set a standard for the States to establish motor vehicle inspection, registration, and uniform certificate of title programs.

The bill is in essence an expansion of a program established by Congress in the National Traffic and Motor Vehicle Safety Act of 1966. At that time attention was centered on the risk of death or injury to persons resulting from inadequate auto design and DOT's responsibility was limited to preventing or reducing personal injury or death.

Today we are focusing on a related problem—that is, the ever-increasing cost of auto insurance attributable to damageability of the automobiles and their repair cost.

In our mobile society, which lacks adequate mass transportation facilities, the automobile has become a necessity rather than a luxury. Consequently the cost of purchasing and operating the automobile is a significant social problem as both the automobile insurance industry and we as regulators are keenly aware.

There are many points at which costs could be reduced—for example, basic auto purchase prices, parking rates, gasoline prices—and certainly economic loss from property damage is one of them. Since much, though not all, economic loss to motor vehicles is paid for through the insurance mechanism, the cost of property damage, collision, and to some extent comprehensive coverages will respond to reductions in damage to motor vehicles involved in accidents. The cost of repair parts and labor are two very substantial items which influence the high cost of automobile insurance.

Insurance companies have manifested great concern about increasing repair costs for motor vehicles. Individually, they are seeking to encourage the purchase of damage resistant autos, to discourage purchase of muscle cars, and to encourage other loss reduction activities like safer driving and stiffer licensing standards.

Collectively, insurance companies are acting through several organizations and committees, most significantly the Insurance Institute for Highway Safety. They are attempting to measure the fragility of automobiles and to ascertain methods of reducing that fragility. Insurers, both individually and collectively, are proceeding to develop indexes of relative susceptibility to damage which could then be used for rate-making purposes.

Insurance regulators are following these developments closely because we too realize the need for property loss reduction. The NAIC Committee on Property and Liability Insurance has held hearings on the progress of methods for determining relative fragility of motor vehicles. The NAIC, working with the individual States, is preparing to develop the needed regulatory techniques and statistics to implement the fragility index concepts in ratemaking.

Of course, the translating of damageability statistics into automobile insurance rates would not in itself result in lower overall costs in operating an automobile. It will, however, permit us to redistribute greater proportion of the same overall economic losses from property damage to those persons who choose to purchase autos with greater susceptibility to damage.

Furthermore, to the extent that the purchasers of automobile insurance consider the relative insurance premiums attributable to damageability in purchasing their cars, the automobile insurance mechanism can contribute to driving those poorly designed cars out of the market and thereby reduce overall economic cost including that of insurance. This, of course, depends upon whether there is a corresponding rise—and to what extent—in cost of designing and manufacturing less damage prone cars and/or in personal injury damage.

Incidentally, it may be appropriate to note some of the factors insurance regulators will be watching as ratemaking based on damageability develops:

(1) Since most individual insurers are not large enough to develop credible statistics, they will find it necessary to pool their data in order to rate older models from real world experience. Insurance departments will be regulating this combining process to protect competition in rates.

(2) Insurance department personnel will be closely examining the results of the prescribed tests to satisfy themselves that there is jurisdiction for rating auto makes and models differently.

(3) Determining the susceptibility of new model cars to damage will require the use of advanced computer techniques. Since many insurers do not have the necessary facilities available they will be using data centrally determined. Departments will wish to satisfy themselves that this data is properly used.

(4) Ratemaking based on relative fragility will result in a different classification system. The departments will be watching these classifications closely to be certain they are equitable and that individual consumers are properly classified.

S. 976 attacks this overall problem head on by authorizing DOT to make tests, set minimum standards, make results available to insurer and regulators for ratemaking purposes, etc. The NAIC endorses the general concepts and objectives embodied in this bill. We would suggest, however, that the bill make explicit direction or authority for DOT to consult with both the insurance industry and the insurance regulators on a continuous basis so that the initial and future test data compiled therefrom and other information will be developed in a form that is usable in automobile insurance ratemaking.

I would like to personally comment specifically on several provisions of S. 976 at this time:

(1) The provisions found in section 125 (b) and (c) are particularly significant and should be expanded to give the Secretary the widest possible powers and unquestioned authority to act in a direct and definitive manner.

(2) Section 127 is particularly important to insure regulators and I suggest that you amend the bill to provide for an official relationship between the Secretary and the State insurance commissioners in at least two areas: (a) the Secretary should be required to consult with representatives of the insurance commissioners from time to time and (b) the Secretary should be required to officially report his findings to the insurance commissioners of the various States.

I am confident that this kind of relationship will be welcomed by the commissioners and also that they will move rapidly to require implementation of rating techniques based on the damageability study.

(3) Section 128 appears to also be a key section and I commend you for such a provision. It should be of great assistance in meeting consumer needs.

(4) The provision to section 501 that requires an independent system of automobile inspection, though idealistically sound, has a measure of impracticality involved in it in my opinion. To require the kind of expense involved in establishing the system contemplated in S. 976 is sure to generate enough opposition to stall if not stop the whole inspection program in many places.

I support your concept, but wonder if you shouldn't modify it to make the proposal more palatable and less expensive in order to receive the broadest support from the States.

I would also suggest there should be some official recognition made in the bill which would require that accident data collection systems be established to show the speed, the angle of impact, the frequency of automobile accidents, and other data which would be particularly important in determining the accuracy of the data which might be included in the damageability index.

In a very hurried way, Senator Moss, that concludes my formal testimony.

Senator Moss. Thank you, Mr. Worthington. I think we will have some questions.

I have to be absent for a short period of time.

Mr. Sutcliffe may have some questions while I am away and I will come back and follow up if there are some he didn't get to that I think ought to be in the record.

Moreover, I might suggest, since you have cooperated by summarizing that rather lengthy statement, it may be that after we have read it in full, we may want to submit a few questions to you, sending them to you in writing, to have you respond.

I am sure you would be glad to do that?

Mr. WORTHINGTON. We would have no objection to that, Senator, we would be pleased to.

Senator Moss. Thank you, and if you will excuse me, I will leave Mr. Sutcliffe here and ask if he has any questions he wants to ask in the interim.

Mr. SUTCLIFFE. Mr. Worthington, before we begin any questioning I want to ask whether or not the arrangement that Senator Moss suggested is satisfactory with you?

Mr. WORTHINGTON. I have no objection.

Mr. SUTCLIFFE. Thank you.

The argument that you pose, suggesting that the States be allowed to test various approaches certainly has some appeal from a theoretical standpoint. There are many unanswered questions in this area of considering automobile reform legislation. When you set about to experiment in the laboratory or in a State, do you need to have some guidelines as to the kind of experiment that should take place and the kinds of goals that you would hope would be met through the experimentation, particularly if you are trying to improve the present reparation system or do you think that it can just take place without that guideline, without that kind of direction, so in order to obtain the results of the experiment?

Could you comment generally on how you can undertake this on an experimental basis, assuming this is one of your arguments, and still end up with a valid experiment?

Mr. WORTHINGTON. I would be glad to.

To use as examples some proposals that are already before us, in Massachusetts they passed one form of a modified no-fault system, with some additional benefits. That plan is now in effect and we are seeing some interesting results. Not enough results are in yet to make a valid observation, I don't think, about the extent to which it meets the problems. But I think it is an excellent opportunity for us to gain some experience.

It is my understanding that in the State of Florida there is a very good opportunity that some form of no-fault bill will pass, which is much different than the one in Massachusetts.

Mr. SUTCLIFFE. Let me stop you right there, so I can understand.

I guess in any kind of experiment you will set it up and design it in such a fashion as to be able to test the results. Have the Massachusetts proponents of no-fault set up through their insurance regulatory mechanism or whatever a procedure whereby they can test the validity of their experiment, where they can get the information that would be useful from an experimental point of view, and if so, could you describe some of that for the committee?

Mr. WORTHINGTON. You are talking about—

Mr. SUTCLIFFE. Do you understand what I mean? In other words, you are saying there appears to be some beneficial results from an experimentation program in Massachusetts. What specifically has Massachusetts done to insure that the information which is coming out of Massachusetts about their plan has validity, measures costs, measures savings, measures redistribution of benefits to improve the problems highlighted in the Department of Transportation study?

Mr. WORTHINGTON. If you are asking was part of the program in Massachusetts a program that would require surveillance and analysis of statistics that might be developed to see how it works, I don't think that it was. There is no business, however, that I know of in the country, that generates more statistics and that has more adequate information about how it functions that are available to both the regulators and to the public, and my observation about the fact that it is providing some information that is interesting and shows it may be beneficial, is based on some of the statistics it has generated.

For example, one of the very interesting ones there has been the fact that there are fewer claims being filed now for physical damage.

Mr. SUTCLIFFE. We have had two explanations, you see. This is the reason I ask the question. Because if the approach to allowing for experimentation is going to be followed, then it seems to me that it is natural to ask what methods of collecting these statistics and validating those statistics are being provided.

We have been told by one group that the decrease in claims in the bodily injury area is a result of the constitutional test, and that the lawyers are simply holding back hoping that the constitutional challenge will be successful.

In another instance it has been explained to us that because of the unique situation in Massachusetts, many of the bodily injury claims reflected property damage claims, because it was a mandatory State

Now it seems to me that if we set out to experiment on a State-by-State basis, apart from whether or not that is a practical possibility, this committee would like to know what assurances we will have that the results from those experiments will produce meaningful information to other States or to the Federal Government in its analysis of the reform.

Mr. WORTHINGTON. I think you are asking is there going to be some supervisory person to look at it to see whether there are meaningful results?

Mr. SUTCLIFFE. Or is the NAIC itself recommending this kind of procedure to the States?

Mr. WORTHINGTON. One of the functions which I currently serve in in the NAIC as chairman of a committee called the Committee on Profitability of Liability and Property Companies. This committee is attempting to look and see what sort of things go into the determination of rates for insurance companies and how much money is sent back to the consumer, how much is generated as a result of their investments. And this kind of committee function in the NAIC will very well, I am sure, sort out the actual statistical and practical profit and public interest items that will result from the experimentations in the various States.

So I think I can say unequivocally that the NAIC, if the States continue to experiment in this manner, will watch closely to see what happens.

We have discussed briefly about whether we should attempt to design a model bill. And it is not an official policy of the NAIC, but the officers have generally agreed that at this point we should not try to design a model bill, but that rather we should observe what the different States are doing and collect the data about the effectiveness of their operations, and after a period of time then put the portions of their program which seem to work most effectively into some model guidelines that could be used by the States that are interested.

Let me go on a little bit about the experimentation. I would say the New York proposal is different than any other State proposal. Illinois has a plan before its legislature.

Mr. SUTCLIFFE. Does it differ, because it suggested that it could be done at either the State or Federal level?

Mr. WORTHINGTON. No; I think it has a completely different thrust, for example, than the one in Illinois or Iowa, because it basically does away with the tort system.

Our proposal is to preserve it, but give first-party coverage in all instances and let the insurance companies subrogate. I have said in the past and would say again that though my plan in Iowa is substantially different from the one in New York, I would hope New York would adopt their bill and give us a chance to gain some experience as a result of its operation.

I would hope Iowa and Illinois would adopt their bills, so we can compare our experience too.

Mr. SUTCLIFFE. To that point then, what mechanism would you create to monitor the cost benefit differences between the Massachusetts plan and the Illinois or Iowa plans? The cost differences, for example, between an inter-insurer subrogation provision or a cost offset provision, differences between, in Massachusetts, the \$500 medical payment

entry into the tort liability system and in Illinois, no entry provision, but a limitation on intangible loss recovery once tort is entered and an offset for any mandatory first-party coverages? How are we going to get the data to analyze that kind of difference?

Because if we are going to experiment, and the argument is we will learn from experimentation, it seems to me we have to be assured we will be able to get that kind of information back.

Mr. WORTHINGTON. I think I can assure you the NAIC in its normal functions will be gathering this data through the work of its committees, through the analysis of the reports that are filed now with the insurance departments, and which are, some of which are created by private organizations.

Mr. SUTCLIFFE. Is that information oriented toward answering the kinds of questions that are being asked now, or is it more oriented toward a business operation within the existing liability system focus?

Mr. WORTHINGTON. The data we would collect, I would anticipate, would be data that would answer the questions we wanted to ask.

Mr. SUTCLIFFE. So you would have to go through some kind of reformulation.

Mr. WORTHINGTON. If the standard reporting techniques we have now are not adequate, we can easily change them to make them adequate. What I am saying basically, I suppose, is that we think we have a system set up now which could gather the information. If it doesn't, then we can modify it.

Mr. SUTCLIFFE. Will you undergo an examination of that prior to the time of finding out that it doesn't produce the information? I mean are you presently engaged in analyzing your reporting system to make sure that it does the job or will you soon be engaged in that endeavor?

Mr. WORTHINGTON. As soon as we know whether or not the Congress is going to allow us to experiment, we will immediately begin the procedures to comply with the stewardship that you have given us. I think our past record in the past few years in the NAIC at least, is indicative of the fact we will do a legitimate job.

Mr. SUTCLIFFE. As to a more basic question about the need for experimentation, how much experimentation was undertaken to test the postinsolvency assessment plans that you have advocated be adopted and have been quite successful in getting adopted in many jurisdictions in this country? When you promulgated that model bill how much experimentation with that system had been undertaken before you set it in concrete, so to speak?

Mr. WORTHINGTON. Before we promulgated our model bill I think there were some six or seven States which already had a form of insolvency fund or form of guarantee fund, and we drafted our bill based on the experience that those other States had had over the past years.

Mr. SUTCLIFFE. Those were all preassessment plans, were they not?

Mr. WORTHINGTON. No; there is a plan like the one in New Jersey, I think—or was it Maryland?—Michigan and California had adopted before our model postassessment plan. One of the things that led us to try the postassessment approach was the experience that they had had with the preassessment plans, and the experience with preassessment plans was such that we felt that was not the proper way to go.

Mr. SUTCLIFFE. You mentioned your organization also includes members of the territories of this country. I noted that with interest. Have you had an opportunity to receive the views of the regulatory authorities from Puerto Rico and had a chance to evaluate that particular experiment?

Mr. WORTHINGTON. The insurance commissioner from Puerto Rico regularly attends our meetings and participates in our committee functions, and he is very vocal about his experiences in Puerto Rico and feels that it is an excellent program for his territory. He is an active participant.

Mr. SUTCLIFFE. Have you come to any conclusions based upon the experience in Puerto Rico as to any recommendation the NAIC would make to States who are going to undertake experiments in reforming their automobile compensation system?

Mr. WORTHINGTON. I think it is too early to draw any valid conclusions about the Puerto Rican situation and recommend them to other States on an official basis. Obviously most of us that are interested in it are going to look closely at it because it is an operating one, just like we will the Massachusetts plan.

Senator Moss. Thank you for excusing me for a short time, and I am sure Mr. Sutcliffe has had a number of questions that have occurred to us in listening to your testimony. One thing I wanted to ask, Mr. Worthington, is, you referred in your statement to the danger of an ill-considered national program for insurance reform. Given the Department of Transportation's study and the extensive congressional hearings, do you really think this—it is ill considered to have a bill of this type before us now?

Mr. WORTHINGTON. I suppose if I were to give a definition of what I mean by ill considered it would have to be something like this, that any proposal which would change the system which has been in effect as long as the tort system has been in effect in the United States without some measure of experimentation or some trial of a new system on a national basis would have to by definition, be ill considered.

We are not indicating that you have not studied it long enough or that learned people have not given their opinions, but rather we are just saying that by the very extent of the enormity of the program it ought to be tried someplace before it is put forth for the whole country.

Senator Moss. Well, I wonder about the parallel between automobile insurance and health insurance. The administration recommends the State regulation in automobile insurance but recommends a national system of health insurance; why should one be treated one way and the other the other?

Mr. WORTHINGTON. We are trying to help them become consistent, Senator.

Senator Moss. Which way?

Mr. WORTHINGTON. In favor of the State.

Senator Moss. I was, of course, pleased to note that you recognized that there needs to be changes and there was a great change going on in the industry. Isn't it true that it is less likely that you can get a change effected in all of the State legislatures? State legislators serve for a minimum period of time, and they are all employed in other lines of employment, and, as has been said, they are subject perhaps

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have in easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a great addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and the territories of the United States.

I shall deal with each of the matters before your Committee separately and start by giving my comments on the Uniform Motor Vehicle Insurance Act and the Administration's proposed Concurrent Resolution.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the Administration has tentatively endorsed the no fault concept, it has concluded that "mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform: and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable."¹ The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault upon non fault "is an issue involving wide spread ramifications far beyond the traditional confines and insurance regulations . . .

"The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy.

"Thus NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Let me add parenthetically that I personally favor the adoption of no fault laws on a state-by-state basis and that I think the need for such laws is of great urgency.

¹ House Concurrent Resolution 241, 92nd Congress, 1st Sess. (1971).

² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Automobile Insurance Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and respond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in the sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objectives.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently

⁴ See *id.* at 112-127.

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

fortified by both Secretary Volpe's statement before the Senate Commerce committee⁷ and by the DOT report which said:

"Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform."⁸

Furthermore, Secretary Volpe said:

"First, it seems clear, at least to us, that *there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system.* It is also clear that *there exists genuine and warranted concern as to the unknown and essentially unknowable price and cost implications of any major change in the system,* which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definite answers to these questions either. As a result, it seems to us that we should seek change through State action, but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."⁹ (Emphasis supplied)

In brief, we simply don't know at this point what the answer or combinations of answers are. With all due respect to the advocates of the federal no-fault plan, we submit that no one knows the answers to these questions (and others which could be posed)—and until we do, no one knows what final form a national program should take.

4. CAVEATS ON FEDERAL MANDATED STANDARDS AND VOLUNTARY GUIDELINES

Secretary Volpe urged that change commence now and the Administration is supporting a joint concurrent resolution putting the states on notice that they are expected to resolve this problem within a reasonable period of time. We don't disagree that some change is needed, although the magnitude or direction of change is subject to intense debate.

a. *Immediate Uniform Massive Change is Premature.* At the one extreme the proposed Uniform Motor Vehicle Insurance Act would establish rigid statutory standards as to what must be in an automobile insurance policy. Such an approach has the practical effect of destroying flexibility and tends to freeze in limitations in coverage.¹⁰ Perhaps even worse, the uniformity imposed would preclude the consuming public from the opportunity to register its choice over a meaningful period of time and thereby make the insurance mechanism responsible to the public's evolving concept as to the appropriate balance between benefits and costs.

b. *The Cost Factor.* No matter how hard we try, it is either impossible or foolhardy to ignore the ramifications of the cost of any given program or alternative. As the NAIC staff study pointed out:

"In appraising the worth of any system, a very important consideration is the cost of such system as compared to the cost of possible alternatives. Public clamor over increasing automobile insurance premium levels has significantly added to the pressure for change.

"... the NAIC strongly supports efforts to reduce the cost of automobile insurance to the public to the extent that such reductions are consistent with other major objectives. It must be remembered that no program can meet all demands since the demands themselves are frequently in conflict. It is virtually impossible to pay more accident victims more dollars and reduce costs at the same time. Thus, whatever changes are recommended they should be evaluated with a view

⁷ "Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket, there is plainly much less of a consensus; the complexity of the subject and its problems make possible an almost limitless number of combinations, permutations and variations of recovery rules, insurance coverages, etc." Statement of Secretary of Transportation John A. Volpe before the Senate Commerce Committee, March 18, 1971, p. 2.

⁸ DOT Report, p. 133.

⁹ Volpe's statement, note 7 supra at 3.

¹⁰ The chief advantage of a standard policy is that it facilitates prior comparison. In the past, uniform terms have often led to uniform and non-competitive prices. Competition in policy terms usually leads to more innovative contrasts and broader terms.

towards the best balance possible between conflicting objectives and particularly between the objectives of increased benefits and cost savings."¹¹ (Emphasis supplied)

As the DOT report noted, "consumer attitudes about automobile insurance have shown its cost to lead all other concerns."¹² Consequently any program which does not afford the consumer an opportunity to relate the benefits he desires to the costs he must pay may create more public dissatisfaction than it eliminates.

This point is particularly relevant to a program such as automobile insurance whose costs are bound to increase. The DOT report has recognized:

"Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation."¹³

In effect, an automobile insurance company is a mass purchaser of a variety of goods and services such as medical, hospital, lawyer and court services, wage replacements, repair goods and services, etc. As the cost of these elements increase, the cost of insurance must do the same.¹⁴

"If such costs continue to inflate (and there is little reason to hope otherwise), initial cost savings resulting from changing the system would soon be forgotten and public frustration with costs would arise anew. This suggests that, while efficiencies in the system are important, drastic changes aimed at reducing premium levels (or lessening increases) may result in only temporary relief."

Much of the American motoring public is being led to believe that no fault is a panacea, bringing with it broader coverage, payment in all cases, and lower costs. The idea that something must be given up in order to get something else back has not yet registered in many quarters. The passage of the proposed legislation, without a preliminary period of trial and error during which the public would become educated as to its advantages and disadvantages and would be able to relate its wants to its costs by choice in the free market, could set the stage for massive public disenchantment with all who were connected with its enactment.

The establishment of minimum mandatory benefits, such as those being discussed, in a federal statute poses far reaching, long-term ramifications. In fact, the same can be said, although perhaps to a lesser extent, as to the establishment of federal guidelines to which the states should strive since such guidelines would tend to become the minimum norm of consumers' expectations as to what they are "entitled to: by right."

If the cost of such benefits exceeds what the public is willing to pay, federal subsidies may be necessary and you should be prepared to recognize that potential need.

c. Cause for Skepticism. Though we don't question the conviction of the proponents of this proposed federal act as to the rightness of their solution, past experience with massive federal programs entitles us to voice some skepticism. For example, we launched into Medicare and Medicaid without an adequate exploration and testing to ascertain the cost implications; the impact on the delivery of health, etc. The program is now being devoured by expenses, the demand on medical facilities has skyrocketed, and now a few short years later persons are advocating scrapping these programs and launching into something else. In conjunction with national health plans it has been said:

"There must be a critical review not only of the estimated cost of such proposals but with the financing mechanisms as well as with the services which are expected to be provided. At the moment, in the rush to design these new proposals, it appears to be forgotten that the planners of Medicare and Medicaid grossly underestimated the cost of these programs. They also gave little heed to the existing shortage of health manpower and facilities which had been seriously aggravated by these new programs."¹⁵

This observation could apply with equal force to the proposals for federal automobile insurance reform. Forecasts as to the costs of this system are necessarily conjectural. It is only by a process of trial and error that the public will ascertain the true costs and only by experimental efforts at the state level can the best solution be found and earlier mistakes more readily rectified before they assume unmanageable proportions.

¹² DOT Report at 188.

¹³ *Id.* at 61.

¹⁴ E.g. over the past decade, doctors' fees and hospital daily service charges increased 58% and 155% respectively. *Id.* at 61.

¹⁵ NAIC report, note 2 supra 108.

¹⁶ Wheatley, "Promises and Problems of National Health Insurance," an address before the American Pension Conference, N.Y., N.Y., March 1971.

This example, as well as other examples which could be named, is not cited in criticism of the results which were sought but rather as an example of what occurs when massive federal involvement and planning on a nationwide uniform basis in complex areas precedes or supersedes the market mechanism as an allocator of economic resources. Original concepts which were so convincingly put forth have often proved to be wrong, but the adverse consequences of the error have been "frozen in" over a period of time.

Let's avoid making a similar mistake as to automobile insurance, which involves 100 million automobile drivers and nearly all American families. This is the message Secretary Volpe is conveying when he emphasizes the need for experimentation. Certainly the Ontario Experience—where motorist rejected coverage combining the fault and no fault concepts put forth on a voluntary basis—should give one pause in mandating a fixed uniform standard on a nationwide basis.

d. *Federal Guidelines.* Although we support the state-by-state approach of the Administration, we do have reservations concerning the adoption of federal guidelines or objectives such as those in the proposed concurrent resolution. Such standards, in addition to the concern previously mentioned above as to the creation of certain expectations, tend to prejudge what the market place has not yet passed upon—e.g. the choice of an essentially no fault over a reformed fault system, the determination that automobile insurance should be the primary coverage, etc. Such standards tend to restrict the range in which proposed changes would fall and hence the range of consumer choice. This does not say that the choices implicit in the standards proposed are incorrect but rather they are premature. If there are to be minimum federal standards, we feel that broader standards which give greater meaning to experimentation should be adopted. The minimum criteria for any automobile insurance system as stated by the NAIC in its Statement of Position on Automobile Insurance could be a sample of the kind of federal standards that would be meaningful. "Nevertheless, a resolution by Congress expressing both the need and its will for prompt state action in exploring, testing and implementing improvements in the existing system would be an appropriate indication of the sense of Congress. This would serve notice on both the business and the states that progress is expected."

5. A TIME FOR CHANGE AND CURRENT MOMENTUM

All of this is not to argue for the status quo, nor to minimize the impact of the landmark DOT study, congressional hearings, academic works, state insurance departments' efforts and NAIC research. Quite to the contrary, each of these have significantly contributed to the emerging consensus that improvements are needed and have pointed out possible directions which should be considered and tested. Furthermore, the NAIC supports the Administration's position of recognizing not only the worth but the virtual necessity of a state-by-state approach until a clearer picture emerges as to the right answers—an answer which may vary from state to state or region to region.

To some proponents of the Uniform Motor Vehicle Insurance Act, the state-by-state approach is tantamount to doing nothing. This is incorrect. In addition to the "prod" from Congress in the form of a Congressional resolution, the states are receiving the same pressures for change that Congress receives. Few if any argue for the status quo. The basic research study is done. As of the early part of this month, we understand that no less than 28 states are now considering no fault or modified no fault legislation. (Other states have created study commissions. Some may be waiting to capitalize on the experimentation of others and others no doubt are waiting to see if Congress is going to preempt the field or give the states time to act.) The proposals range from the complete n

¹⁷ "Whatever is decided as to the appropriate legal framework, the NAIC believes that any automobile insurance system should include as a minimum the following elements:

- (a) ready access to insurance for all licensed drivers at prices which are reasonable with a means to purchase insurance through an assigned risk mechanism for those who cannot purchase it in the voluntary market.
- (b) provision for prompt payment of basic economic loss and improved claims procedures.
- (c) provision for protection from insolvencies, uninsured motorists and hit-and-run drivers, etc.
- (d) meaningful classifications which are broad enough to spread risks and yet not so broad as to lessen availability of coverage.
- (e) a responsive and meaningful pricing and marketing system.
- (f) protection for the insured against arbitrary and unfair cancellation and nonrenewal.
- (g) full disclosure of the nature of the coverage to the purchaser."

fault program of the American Automobile Insurance Association to those which primarily seek to improve the existing legal liability system such as the American Trial Lawyer's Reform package with all sorts of variations in between.

Secretary Volpe, in his statement before the Senate Commerce Committee said: "Further change in the auto reparation system at the state level has clearly moved off dead center and would appear to be achieving some momentum. I could not have made that statement a year ago. I think this constructive move should be encouraged, perhaps guided and helped but not preempted by federal action."¹⁵

The activities mentioned above support the basis for the Secretary's beliefs and clearly demonstrate the heightened momentum. At this point, with so many different and sometimes conflicting ideas "floating around," and so much uncertainty as to what should be done, it is too early to predict what the states will and will not do. But events are moving sufficiently so, in our judgment, to warrant giving the states an adequate opportunity to act. If past experience is any guide, a variety of approaches will be tested and the best features of the various programs will emerge. At that point, the trend will be towards a more uniform system throughout the various states.

Of course, during the period of experimentation, we would be going through a phase when a number of different plans would be used in a number of different states. America is a mobile nation. Complications can be expected in the administration of a system as significant portions of the public journey across state lines. During this period, insurers operating across state borders will have to provide for the variation in coverage through appropriate endorsements. It will present some administrative problems for the insurers and regulatory problems for the states. But this is a small price to pay compared to the damage which could occur if an ill-considered national program was imposed upon the nation in one installment from the top.

6. FEDERAL REGULATORY INTERVENTION

Although most attention on the proposed Uniform Motor Vehicle Insurance Act has focused on the mandating of the no fault concept, the Act poses another fundamental issue—i.e. state versus federal regulation of automobile insurance. There can be no mistake as to the pervasive regulatory power vested in the Secretary of Transportation. For example, the Secretary would (1) determine and approve the financial substitutes for insurance (i.e. bonds, self insurance), (2) determine by rules and regulations the percentage of responsibility for net economic loss assigned to motor vehicles larger than ordinary passenger cars, (3) approve policy terms, conditions, exclusions, and deductibles, (4) promulgate a uniform statistical plan for compilation of claims and loss experience which every insurer must follow, (5) require standard uniform and standard minimal policy provisions, classes of risks, and rating territories, (6) prescribe rules and regulations under which insurers would submit premiums being charged for each class of risk in each rating territory, (7) make available a comparison of insurers' rates based upon claim and loss experience, (8) organize an assigned claims bureau in each state, and (9) make, amend, and repeal rules and regulations as he deems necessary.

Under existing state law, the insurance department possesses comprehensive regulatory authority over insurers doing business therein. For example, state regulation encompasses these elements: (1) the incorporation of companies qualifications, capital and surplus requirements, etc.), (2) the specification of required reserves, (3) the specifications of the areas in which insurance assets may be invested, (4) the approval of policy forms, (5) the supervision or monitoring of rates (for adequacy, excessiveness and non-discrimination), (6) the collection of statistics and the making of reports, (7) the examination of companies to determine if reserves are adequate, investments comply with the law, claim practices are satisfactory, etc., (8) the licensing and supervision of those who sell insurance, and (9) provision for residual coverages such as the assigned risk plans.

The regulatory overlap is substantial and clear. Confusion, waste, an increasingly complex system, and extra cost to the taxpayer in administering the automobile insurance is bound to result. We submit that such a dual system is not in the public interest.

¹⁵ Volpe's statement, note 7 *supra* at 4.

entry into the tort liability system and in Illinois, no entry provision, but a limitation on intangible loss recovery once tort is entered and an offset for any mandatory first-party coverages? How are we going to get the data to analyze that kind of difference?

Because if we are going to experiment, and the argument is we will learn from experimentation, it seems to me we have to be assured we will be able to get that kind of information back.

Mr. WORTHINGTON. I think I can assure you the NAIC in its normal functions will be gathering this data through the work of its committees, through the analysis of the reports that are filed now with the insurance departments, and which are, some of which are created by private organizations.

Mr. SUTCLIFFE. Is that information oriented toward answering the kinds of questions that are being asked now, or is it more oriented toward a business operation within the existing liability system focus?

Mr. WORTHINGTON. The data we would collect, I would anticipate, would be data that would answer the questions we wanted to ask.

Mr. SUTCLIFFE. So you would have to go through some kind of reformulation.

Mr. WORTHINGTON. If the standard reporting techniques we have now are not adequate, we can easily change them to make them adequate. What I am saying basically, I suppose, is that we think we have a system set up now which could gather the information. If it doesn't, then we can modify it.

Mr. SUTCLIFFE. Will you undergo an examination of that prior to the time of finding out that it doesn't produce the information? I mean are you presently engaged in analyzing your reporting system to make sure that it does the job or will you soon be engaged in that endeavor?

Mr. WORTHINGTON. As soon as we know whether or not the Congress is going to allow us to experiment, we will immediately begin the procedures to comply with the stewardship that you have given us. I think our past record in the past few years in the NAIC at least, is indicative of the fact we will do an adequate job.

Mr. SUTCLIFFE. As to a more basic question about the need for experimentation, how much experimentation was undertaken to test the postinsolvency assessment plans that you have advocated be adopted and have been quite successful in getting adopted in many jurisdictions in this country? When you promulgated that model bill how much experimentation with that system had been undertaken before you set it in concrete, so to speak?

Mr. WORTHINGTON. Before we promulgated our model bill I think there were some six or seven States which already had a form of insolvency fund or form of guarantee fund, and we drafted our bill based on the experience that those other States had had over the past years.

Mr. SUTCLIFFE. Those were all preassessment plans, were they not?

Mr. WORTHINGTON. No; there is a plan like the one in New Jersey, I think—or was it Maryland?—Michigan and California had adopted before our model postassessment plan. One of the things that led us to try the postassessment approach was the experience that they had had with the preassessment plans, and the experience with preassessment plans was such that we felt that was not the proper way to go.

Mr. SUTCLIFFE. You mentioned your organization also includes members of the territories of this country. I noted that with interest. Have you had an opportunity to receive the views of the regulatory authorities from Puerto Rico and had a chance to evaluate that particular experiment?

Mr. WORTHINGTON. The insurance commissioner from Puerto Rico regularly attends our meetings and participates in our committee functions, and he is very vocal about his experiences in Puerto Rico and feels that it is an excellent program for his territory. He is an active participant.

Mr. SUTCLIFFE. Have you come to any conclusions based upon the experience in Puerto Rico as to any recommendation the NAIC would make to States who are going to undertake experiments in reforming their automobile compensation system?

Mr. WORTHINGTON. I think it is too early to draw any valid conclusions about the Puerto Rican situation and recommend them to other States on an official basis. Obviously most of us that are interested in it are going to look closely at it because it is an operating one, just like we will the Massachusetts plan.

Senator Moss. Thank you for excusing me for a short time, and I am sure Mr. Sutcliffe has had a number of questions that have occurred to us in listening to your testimony. One thing I wanted to ask, Mr. Worthington, is, you referred in your statement to the danger of an ill-considered national program for insurance reform. Given the Department of Transportation's study and the extensive congressional hearings, do you really think this—it is ill considered to have a bill of this type before us now?

Mr. WORTHINGTON. I suppose if I were to give a definition of what I mean by ill considered it would have to be something like this, that any proposal which would change the system which has been in effect as long as the tort system has been in effect in the United States without some measure of experimentation or some trial of a new system on a national basis would have to by definition, be ill considered.

We are not indicating that you have not studied it long enough or that learned people have not given their opinions, but rather we are just saying that by the very extent of the enormity of the program it ought to be tried someplace before it is put forth for the whole country.

Senator Moss. Well, I wonder about the parallel between automobile insurance and health insurance. The administration recommends the State regulation in automobile insurance but recommends a national system of health insurance; why should one be treated one way and the other the other?

Mr. WORTHINGTON. We are trying to help them become consistent, Senator.

Senator Moss. Which way?

Mr. WORTHINGTON. In favor of the State.

Senator Moss. I was, of course, pleased to note that you recognized that there needs to be changes and there was a great change going on in the industry. Isn't it true that it is less likely that you can get a change effected in all of the State legislatures? State legislators serve for a minimum period of time, and they are all employed in other lines of employment, and, as has been said, they are subject perhaps

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have an easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a great addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the AIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and the territories of the United States.

I shall deal with each of the matters before your Committee separately and start by giving my comments on the Uniform Motor Vehicle Insurance Act and the Administration's proposed Concurrent Resolution.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the Administration has tentatively endorsed the no fault concept, it has concluded that "mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform; and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable."¹ The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault upon non fault "is an issue involving wide spread ramifications far beyond the traditional confines and insurance regulations . . .

"The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy."

"Thus NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis."²

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Let me add parenthetically that I personally favor the adoption of no fault laws on a state-by-state basis and that I think the need for such laws is of great urgency.

¹ House Concurrent Resolution 241, 92nd Congress, 1st Sess. (1971).

² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Automobile Insurance Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study: a copy of the report is submitted for the record.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and respond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in the sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objectives.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently

⁴ See *id.* at 112-127.

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

fortified by both Secretary Volpe's statement before the Senate Commerce committee⁷ and by the DOT report which said:

"Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform."⁸

Furthermore, Secretary Volpe said:

"First, it seems clear, at least to us, that *there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system.* It is also clear that *there exists genuine and warranted concern as to the unknown and essentially unknowable price and cost implications of any major change in the system,* which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definite answers to these questions either. As a result, it seems to us that we should seek change through State action, but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."⁹ (Emphasis supplied)

In brief, we simply don't know at this point what the answer or combinations of answers are. With all due respect to the advocates of the federal no-fault plan, we submit that no one knows the answers to these questions (and others which could be posed)—and until we do, no one knows what final form a national program should take.

4. CAVEATS ON FEDERAL MANDATED STANDARDS AND VOLUNTARY GUIDELINES

Secretary Volpe urged that change commence now and the Administration is supporting a joint concurrent resolution putting the states on notice that they are expected to resolve this problem within a reasonable period of time. We don't disagree that some change is needed, although the magnitude or direction of change is subject to intense debate.

a. *Immediate Uniform Massive Change is Premature.* At the one extreme the proposed Uniform Motor Vehicle Insurance Act would establish rigid statutory standards as to what must be in an automobile insurance policy. Such an approach has the practical effect of destroying flexibility and tends to freeze in limitations in coverage.¹⁰ Perhaps even worse, the uniformity imposed would preclude the consuming public from the opportunity to register its choice over a meaningful period of time and thereby make the insurance mechanism responsible to the public's evolving concept as to the appropriate balance between benefits and costs.

b. *The Cost Factor.* No matter how hard we try, it is either impossible or foolhardy to ignore the ramifications of the cost of any given program or alternative. As the NAIC staff study pointed out:

"In appraising the worth of any system, a very important consideration is the cost of such system as compared to the cost of possible alternatives. Public clamor over increasing automobile insurance premium levels has significantly added to the pressure for change.

"... the NAIC strongly supports efforts to reduce the cost of automobile insurance to the public to the extent that such reductions are consistent with other major objectives. It must be remembered that no program can meet all demands since the demands themselves are frequently in conflict. It is virtually impossible to pay more accident victims more dollars and reduce costs at the same time. Thus, whatever changes are recommended they should be evaluated with a view

⁷ "Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket, there is plainly much less of a consensus; the complexity of the subject and its problems make possible an almost limitless number of combinations, permutations and variations of recovery rules, insurance coverages, etc." Statement of Secretary of Transportation John A. Volpe before the Senate Commerce Committee, March 18, 1971, p. 2.

⁸ DOT Report, p. 133.

⁹ Volpe's statement, note 7 supra at 3.

¹⁰ The chief advantage of a standard policy is that it facilitates prior comparisons. In the past, uniform terms have often led to uniform and non-competitive prices. Competition in policy terms usually leads to more innovative contrasts and broader terms.

towards the best balance possible between conflicting objectives and particularly between the objectives of increased benefits and cost savings."¹¹ (Emphasis supplied)

As the DOT report noted, "consumer attitudes about automobile insurance have shown its cost to lead all other concerns."¹² Consequently any program which does not afford the consumer an opportunity to relate the benefits he desires to the costs he must pay may create more public dissatisfaction than it eliminates.

This point is particularly relevant to a program such as automobile insurance whose costs are bound to increase. The DOT report has recognized:

"Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation."¹³

In effect, an automobile insurance company is a mass purchaser of a variety of goods and services such as medical, hospital, lawyer and court services, wage replacements, repair goods and services, etc. As the cost of these elements increase, the cost of insurance must do the same.¹⁴

"If such costs continue to inflate (and there is little reason to hope otherwise), initial cost savings resulting from changing the system would soon be forgotten and public frustration with costs would arise anew. This suggests that, while efficiencies in the system are important, drastic changes aimed at reducing premium levels (or lessening increases) may result in only temporary relief."¹⁵

Much of the American motoring public is being led to believe that no fault is a panacea, bringing with it broader coverage, payment in all cases, and lower costs. The idea that something must be given up in order to get something else back has not yet registered in many quarters. The passage of the proposed legislation, without a preliminary period of trial and error during which the public would become educated as to its advantages and disadvantages and would be able to relate its wants to its costs by choice in the free market, could set the stage for massive public disenchantment with all who were connected with its enactment.

The establishment of minimum mandatory benefits, such as those being discussed, in a federal statute poses far reaching, long-term ramifications. In fact, the same can be said, although perhaps to a lesser extent, as to the establishment of federal guidelines to which the states should strive since such guidelines would tend to become the minimum norm of consumers' expectations as to what they are "entitled to: by right."

If the cost of such benefits exceeds what the public is willing to pay, federal subsidies may be necessary and you should be prepared to recognize that potential need.

c. *Cause for Skepticism.* Though we don't question the conviction of the proponents of this proposed federal act as to the rightness of their solution, past experience with massive federal programs entitles us to voice some skepticism. For example, we launched into Medicare and Medicaid without an adequate exploration and testing to ascertain the cost implications; the impact on the delivery of health, etc. The program is now being devoured by expenses, the demand on medical facilities has skyrocketed, and now a few short years later persons are advocating scrapping these programs and launching into something else. In conjunction with national health plans it has been said:

"There must be a critical review not only of the estimated cost of such proposals but with the financing mechanisms as well as with the services which are expected to be provided. At the moment, in the rush to design these new proposals, it appears to be forgotten that the planners of Medicare and Medicaid grossly underestimated the cost of these programs. They also gave little heed to the existing shortage of health manpower and facilities which had been seriously aggravated by these new programs."¹⁶

This observation could apply with equal force to the proposals for federal automobile insurance reform. Forecasts as to the costs of this system are necessarily conjectural. It is only by a process of trial and error that the public will ascertain the true costs and only by experimental efforts at the state level can the best solution be found and earlier mistakes more readily rectified before they assume unmanageable proportions.

¹⁵ NAIC report, note 2 *supra* 108.

¹⁶ Wheatley, "Promises and Problems of National Health Insurance," an address before the American Pension Conference, N.Y., N.Y., March 1971.

Furthermore, to the extent that the purchasers of automobile insurance consider the relative insurance premiums attributable to damageability in purchasing their cars, the automobile insurance mechanism can contribute to driving those poorly designed cars out of the market and thereby reduce overall economic cost including that of insurance. This, of course, depends upon whether there is a corresponding rise—and to what extent—in cost of designing and manufacturing less damage prone cars and/or in personal injury damage.

Incidentally, it may be appropriate to note some of the factors insurance regulators will be watching as ratemaking based on damageability develops:

(1) Since most individual insurers are not large enough to develop credible statistics, they will find it necessary to pool their data in order to rate older models from real world experience. Insurance departments will be regulating this combining process to protect competition in rates.

(2) Insurance department personnel will be closely examining the results of the prescribed tests to satisfy themselves that there is jurisdiction for rating auto makes and models differently.

(3) Determining the susceptibility of new model cars to damage will require the use of advanced computer techniques. Since many insurers do not have the necessary facilities available they will be using data centrally determined. Departments will wish to satisfy themselves that this data is properly used.

(4) Ratemaking based on relative fragility will result in a different classification system. The departments will be watching these classifications closely to be certain they are equitable and that individual consumers are properly classified.

S. 976 attacks this overall problem head on by authorizing DOT to make tests, set minimum standards, make results available to insurers and regulators for ratemaking purposes, etc. The NAIC endorses the general concepts and objectives embodied in this bill. We would suggest, however, that the bill make explicit direction or authority for DOT to consult with both the insurance industry and the insurance regulators on a continuous basis so that the initial and future tests, data compiled therefrom and other information will be developed in a form that is usable in automobile insurance ratemaking.

I would like to personally comment specifically on several provisions of S. 976 at this time:

(1) The provisions found in section 125 (b) and (c) are particularly significant and should be expanded to give the Secretary the widest possible powers and unquestioned authority to act in a direct and definitive manner.

(2) Section 127 is particularly important to insure regulators and I suggest that you amend the bill to provide for an official relationship between the Secretary and the State insurance commissioners in at least two areas: (a) the Secretary should be required to consult with representatives of the insurance commissioners from time to time and (b) the Secretary should be required to officially report his findings to the insurance commissioners of the various States.

I am confident that this kind of relationship will be welcomed by the commissioners and also that they will move rapidly to require implementation of rating techniques based on the damageability studies.

(3) Section 128 appears to also be a key section and I commend you for such a provision. It should be of great assistance in meeting consumer needs.

(4) The provision to section 501 that requires an independent system of automobile inspection, though idealistically sound, has a measure of impracticality involved in it in my opinion. To require the kind of expense involved in establishing the system contemplated in S. 976 is sure to generate enough opposition to stall if not stop the whole inspection program in many places.

I support your concept, but wonder if you shouldn't modify it to make the proposal more palatable and less expensive in order to receive the broadest support from the States.

I would also suggest there should be some official recognition made in the bill which would require that accident data collection systems be established to show the speed, the angle of impact, the frequency of automobile accidents, and other data which would be particularly important in determining the accuracy of the data which might be included in the damageability index.

In a very hurried way, Senator Moss, that concludes my formal testimony.

Senator Moss. Thank you, Mr. Worthington. I think we will have some questions.

I have to be absent for a short period of time.

Mr. Sutcliffe may have some questions while I am away and I will come back and follow up if there are some he didn't get to that I think ought to be in the record.

Moreover, I might suggest, since you have cooperated by summarizing that rather lengthy statement, it may be that after we have read it in full, we may want to submit a few questions to you, sending them to you in writing, to have you respond.

I am sure you would be glad to do that?

Mr. WORTHINGTON. We would have no objection to that, Senator, we would be pleased to.

Senator Moss. Thank you, and if you will excuse me, I will leave Mr. Sutcliffe here and ask if he has any questions he wants to ask in the interim.

Mr. SUTCLIFFE. Mr. Worthington, before we begin any questioning I want to ask whether or not the arrangement that Senator Moss suggested is satisfactory with you?

Mr. WORTHINGTON. I have no objection.

Mr. SUTCLIFFE. Thank you.

The argument that you pose, suggesting that the States be allowed to test various approaches certainly has some appeal from a theoretical standpoint. There are many unanswered questions in this area of considering automobile reform legislation. When you set about to experiment in the laboratory or in a State, do you need to have some guidelines as to the kind of experiment that should take place and the kinds of goals that you would hope would be met through the experimentation, particularly if you are trying to improve the present reparation system or do you think that it can just take place without that guideline, without that kind of direction, so in order to obtain the results of the experiment?

Could you comment generally on how you can undertake this on an experimental basis, assuming this is one of your arguments, and still end up with a valid experiment?

Mr. WORTHINGTON. I would be glad to.

To use as examples some proposals that are already before us, in Massachusetts they passed one form of a modified no-fault system, with some additional benefits. That plan is now in effect and we are seeing some interesting results. Not enough results are in yet to make a valid observation, I don't think, about the extent to which it meets the problems. But I think it is an excellent opportunity for us to gain some experience.

It is my understanding that in the State of Florida there is a very good opportunity that some form of no-fault bill will pass, which is much different than the one in Massachusetts.

Mr. SUTCLIFFE. Let me stop you right there, so I can understand.

I guess in any kind of experiment you will set it up and design it in such a fashion as to be able to test the results. Have the Massachusetts proponents of no-fault set up through their insurance regulatory mechanism or whatever a procedure whereby they can test the validity of their experiment, where they can get the information that would be useful from an experimental point of view, and if so, could you describe some of that for the committee?

Mr. WORTHINGTON. You are talking about—

Mr. SUTCLIFFE. Do you understand what I mean? In other words, you are saying there appears to be some beneficial results from an experimentation program in Massachusetts. What specifically has Massachusetts done to insure that the information which is coming out of Massachusetts about their plan has validity, measures costs, measures savings, measures redistribution of benefits to improve the problems highlighted in the Department of Transportation study?

Mr. WORTHINGTON. If you are asking was part of the program in Massachusetts a program that would require surveillance and analysis of statistics that might be developed to see how it works, I don't think that it was. There is no business, however, that I know of in the country, that generates more statistics and that has more adequate information about how it functions that are available to both the regulators and to the public, and my observation about the fact that it is providing some information that is interesting and shows it may be beneficial, is based on some of the statistics it has generated.

For example, one of the very interesting ones there has been the fact that there are fewer claims being filed now for physical damage.

Mr. SUTCLIFFE. We have had two explanations, you see. This is the reason I ask the question. Because if the approach to allowing for experimentation is going to be followed, then it seems to me that it is natural to ask what methods of collecting these statistics and validating those statistics are being provided.

We have been told by one group that the decrease in claims in the bodily injury area is a result of the constitutional test, and that the lawyers are simply holding back hoping that the constitutional challenge will be successful.

In another instance it has been explained to us that because of the unique situation in Massachusetts, many of the bodily injury claims reflected property damage claims, because it was a mandatory State

Now it seems to me that if we set out to experiment on a State-by-State basis, apart from whether or not that is a practical possibility, this committee would like to know what assurances we will have that the results from those experiments will produce meaningful information to other States or to the Federal Government in its analysis of the reform.

Mr. WORTHINGTON. I think you are asking is there going to be some supervisory person to look at it to see whether there are meaningful results?

Mr. SUTCLIFFE. Or is the NAIC itself recommending this kind of procedure to the States?

Mr. WORTHINGTON. One of the functions which I currently serve in in the NAIC as chairman of a committee called the Committee on Profitability of Liability and Property Companies. This committee is attempting to look and see what sort of things go into the determination of rates for insurance companies and how much money is sent back to the consumer, how much is generated as a result of their investments. And this kind of committee function in the NAIC will very well, I am sure, sort out the actual statistical and practical profit and public interest items that will result from the experimentations in the various States.

So I think I can say unequivocally that the NAIC, if the States continue to experiment in this manner, will watch closely to see what happens.

We have discussed briefly about whether we should attempt to design a model bill. And it is not an official policy of the NAIC, but the officers have generally agreed that at this point we should not try to design a model bill, but that rather we should observe what the different States are doing and collect the data about the effectiveness of their operations, and after a period of time then put the portions of their program which seem to work most effectively into some model guidelines that could be used by the States that are interested.

Let me go on a little bit about the experimentation. I would say the New York proposal is different than any other State proposal. Illinois has a plan before its legislature.

Mr. SUTCLIFFE. Does it differ, because it suggested that it could be done at either the State or Federal level?

Mr. WORTHINGTON. No; I think it has a completely different thrust, for example, than the one in Illinois or Iowa, because it basically does away with the tort system.

Our proposal is to preserve it, but give first-party coverage in all instances and let the insurance companies subrogate. I have said in the past and would say again that though my plan in Iowa is substantially different from the one in New York, I would hope New York would adopt their bill and give us a chance to gain some experience as a result of its operation.

I would hope Iowa and Illinois would adopt their bills, so we can compare our experience too.

Mr. SUTCLIFFE. To that point then, what mechanism would you create to monitor the cost benefit differences between the Massachusetts plan and the Illinois or Iowa plans? The cost differences, for example, between an inter-insurer subrogation provision or a cost offset provision, differences between, in Massachusetts, the \$500 medical payment

entry into the tort liability system and in Illinois, no entry provision, but a limitation on intangible loss recovery once tort is entered and an offset for any mandatory first-party coverages? How are we going to get the data to analyze that kind of difference?

Because if we are going to experiment, and the argument is we will learn from experimentation, it seems to me we have to be assured we will be able to get that kind of information back.

Mr. WORTHINGTON. I think I can assure you the NAIC in its normal functions will be gathering this data through the work of its committees, through the analysis of the reports that are filed now with the insurance departments, and which are, some of which are created by private organizations.

Mr. SUTCLIFFE. Is that information oriented toward answering the kinds of questions that are being asked now, or is it more oriented toward a business operation within the existing liability system focus?

Mr. WORTHINGTON. The data we would collect, I would anticipate, would be data that would answer the questions we wanted to ask.

Mr. SUTCLIFFE. So you would have to go through some kind of reformulation.

Mr. WORTHINGTON. If the standard reporting techniques we have now are not adequate, we can easily change them to make them adequate. What I am saying basically, I suppose, is that we think we have a system set up now which could gather the information. If it doesn't, then we can modify it.

Mr. SUTCLIFFE. Will you undergo an examination of that prior to the time of finding out that it doesn't produce the information? I mean are you presently engaged in analyzing your reporting system to make sure that it does the job or will you soon be engaged in that endeavor?

Mr. WORTHINGTON. As soon as we know whether or not the Congress is going to allow us to experiment, we will immediately begin the procedures to comply with the stewardship that you have given us. I think our past record in the past few years in the NAIC at least, is indicative of the fact we will do an adequate job.

Mr. SUTCLIFFE. As to a more basic question about the need for experimentation, how much experimentation was undertaken to test the postinsolvency assessment plans that you have advocated be adopted and have been quite successful in getting adopted in many jurisdictions in this country? When you promulgated that model bill how much experimentation with that system had been undertaken before you set it in concrete, so to speak?

Mr. WORTHINGTON. Before we promulgated our model bill I think there were some six or seven States which already had a form of insolvency fund or form of guarantee fund, and we drafted our bill based on the experience that those other States had had over the past years.

Mr. SUTCLIFFE. Those were all preassessment plans, were they not?

Mr. WORTHINGTON. No; there is a plan like the one in New Jersey, I think—or was it Maryland?—Michigan and California had adopted before our model postassessment plan. One of the things that led us to try the postassessment approach was the experience that they had had with the preassessment plans, and the experience with preassessment plans was such that we felt that was not the proper way to go.

Mr. SUTCLIFFE. You mentioned your organization also includes members of the territories of this country. I noted that with interest. Have you had an opportunity to receive the views of the regulatory authorities from Puerto Rico and had a chance to evaluate that particular experiment?

Mr. WORTHINGTON. The insurance commissioner from Puerto Rico regularly attends our meetings and participates in our committee functions, and he is very vocal about his experiences in Puerto Rico and feels that it is an excellent program for his territory. He is an active participant.

Mr. SUTCLIFFE. Have you come to any conclusions based upon the experience in Puerto Rico as to any recommendation the NAIC would make to States who are going to undertake experiments in reforming their automobile compensation system?

Mr. WORTHINGTON. I think it is too early to draw any valid conclusions about the Puerto Rican situation and recommend them to other States on an official basis. Obviously most of us that are interested in it are going to look closely at it because it is an operating one, just like we will the Massachusetts plan.

Senator Moss. Thank you for excusing me for a short time, and I am sure Mr. Sutcliffe has had a number of questions that have occurred to us in listening to your testimony. One thing I wanted to ask, Mr. Worthington, is, you referred in your statement to the danger of an ill-considered national program for insurance reform. Given the Department of Transportation's study and the extensive congressional hearings, do you really think this—it is ill considered to have a bill of this type before us now?

Mr. WORTHINGTON. I suppose if I were to give a definition of what I mean by ill considered it would have to be something like this, that any proposal which would change the system which has been in effect as long as the tort system has been in effect in the United States without some measure of experimentation or some trial of a new system on a national basis would have to by definition, be ill considered.

We are not indicating that you have not studied it long enough or that learned people have not given their opinions, but rather we are just saying that by the very extent of the enormity of the program it ought to be tried someplace before it is put forth for the whole country.

Senator Moss. Well, I wonder about the parallel between automobile insurance and health insurance. The administration recommends the State regulation in automobile insurance but recommends a national system of health insurance; why should one be treated one way and the other the other?

Mr. WORTHINGTON. We are trying to help them become consistent, Senator.

Senator Moss. Which way?

Mr. WORTHINGTON. In favor of the State.

Senator Moss. I was, of course, pleased to note that you recognized that there needs to be changes and there was a great change going on in the industry. Isn't it true that it is less likely that you can get a change effected in all of the State legislatures? State legislators serve for a minimum period of time, and they are all employed in other lines of employment, and, as has been said, they are subject perhaps

to lobbying pressures more strongly than national legislators. Doesn't that argue against depending on the States to make the changes?

Mr. WORTHINGTON. I think not, Senator, for a couple of reasons. One is that in recent years in reference to insurance matters the States have responded quite well to the problems as they have been called to our attention. Mr. Sutcliffe mentioned a proposed national guarantee fund. Some 38 States have now adopted a form of proposals which would protect people from insolvencies of insurers in the period of 18 months. We have reason to believe that nearly all States will have this kind of proposal in short order. And this is while Congress is still deciding whether or not to do it. So we have acted really more rapidly than the Congress has in this matter.

When the problem of conglomerates dipping into the surplus of insurance companies became prevalent we began to draft a model bill to regulate insurance-holding companies so the conglomerates and insurance interests could not, without regulatory involvement, dip in and take surplus which had been made for the benefit of the policyholders.

Nearly all insurance-holding companies in the United States are now effectively regulated by the insurance-holding company bill. There are others where we have not been so successful, but where there has been a major national problem we have responded. And my testimony before you is such that again I want to restate that if the States do not act, I would be one of the first people to ask Congress to act. But I think that the States are bearing their stewardship responsibility in reference to insurance regulation adequately and resourcefully, and that only until it can be shown that they are not should you move in and act.

And the bill that is proposed would alter significantly the regulation of insurance other than providing the kind of benefits you want to provide. We think we can provide those same benefits in an expeditious manner without thrusting on people the kind of duplicatory, regulatory mechanism which would have to be imposed.

Senator Moss. Doesn't this no-fault problem really extend beyond State lines? It is not confined to any particular area or any particular group. Isn't this then a major policy decision of the type that ought to be made on the national level by the National Congress?

Mr. WORTHINGTON. I do not think that it should necessarily. For example, if a person in Iowa were to buy a policy under the proposed Iowa plan and travel to Illinois, or travel to New York, or travel to Massachusetts or Florida, somewhere else that had a different kind of plan, it would be a relatively easy matter for the insurance carriers writing policies in any State to put riders on the policy that would give the people the coverage which would be necessary for whatever State they were driving in just like they have to do with Canada now. I do not think that the crossing of State lines is as significant a problem as it might be; it could be handled with relatively little complication and little administrative problem.

The people in rural States, for example, have many different kinds of problems than those that live in the urban centers of our country. And the no-fault insurance program which would be adequate, and which would be meaningful to the people in rural Iowa, for example,

may not be adequate and may not be appropriate for the people living in Detroit or Manhattan or Los Angeles.

On the other side of the coin, if the bill is drafted to be in between both of them, it really meets neither of their needs. We think they need to be geared more definitely toward the people who will receive the benefits.

Senator Moss. Yes, but your rural resident of Iowa is not always driving around rural Iowa; he drives off to Chicago or Detroit or someplace like that.

Mr. WORTHINGTON. Right. I am saying it is a relatively easy administrative matter to include, as a provision of his policy, minimum coverage for whatever State he happens to be driving in. A man who commuted between one State and another State would obviously have an easy time getting his policy amended because that is something he would just have to have. The companies can do it with little difficulty. The regulators can assist them in this; we are experienced in that matter already because we do it in other areas.

Senator Moss. But if one State has a no-fault rule and his insurance is written for a State that does not have that but has the traditional tort requirement—what law is applied to him? He is driving in a no-fault State, but his insurance policy is not geared to that; can this be easily adapted?

Mr. WORTHINGTON. Yes; it would. He would have a policy obviously in the State he lives in, which would meet those rules. And there would be as a provision of that policy a rider that would say something to the effect that the provisions of this policy shall meet the minimum requirements for whatever State in which he may be involved in an accident, very simply.

Obviously the lawyers would make it longer and more complicated than that, but very simply that is what it would consist of. So if he were in a no-fault State and had an accident in a fault State, he would have the minimum requirements in that State.

Senator Moss. There might be a little problem in the rule of law they apply, the rule of proof and so on. But I acknowledge your view that it could be readily adapted.

We do appreciate your coming to testify before the committee and preparing such a well documented and full statement that will be a great addition to our record.

Thank you very much.

Thank you, gentlemen, for coming.

(The statement follows:)

STATEMENT OF LORNE R. WORTHINGTON, INSURANCE COMMISSIONER OF THE STATE OF IOWA, ON BEHALF OF THE NATIONAL ASSOCIATION OF INSURANCE COMMISSIONERS

My name is Lorne R. Worthington. Today I am appearing on behalf of the National Association of Insurance Commissioners, commonly referred to as the NAIC, both as the Insurance Commissioner of the State of Iowa and as President of the NAIC. Having its inception in and regular meetings since 1871, the NAIC is the oldest voluntary association of state officials. It includes the principal insurance regulatory authorities of the 50 states, the District of Columbia, and the territories of the United States.

I shall deal with each of the matters before your Committee separately and start by giving my comments on the Uniform Motor Vehicle Insurance Act and the Administration's proposed Concurrent Resolution.

1. THE ISSUE

The Uniform Motor Vehicle Insurance Act would create a federally mandated motor vehicle insurance system predicated on the no fault concept for bodily injury. The statute, among other things, would prescribe the minimum coverage which motorists would be required to purchase. In contrast, although the Administration has tentatively endorsed the no fault concept, it has concluded that "mere speculation without actual observation of experience with a new plan is an inadequate basis for massive, uniform national reform: and that the federal assumption of the current state regulatory authority over automobile insurance poses great issues and consequences and is highly undesirable."¹ The Administration recommends that solutions, built upon specified general principles, evolve at the state level to permit experimentation and testing of different approaches. *Thus the basic issue is joined—i.e. what is the most appropriate approach to test and/or implement the no fault concept.*

2. NAIC POSITION ON THE NO FAULT CONCEPT

At the outset, let me indicate the perspective from which the NAIC, as an association of state insurance regulators, views the fault versus no fault concept. The tort liability system is a legal system which is separate and distinct from the automobile insurance system. When the first automobile insurance policy was written prior to 1900, the fault concept was well embedded. The automobile insurance system, and the regulation thereof, of necessity, has in large part been engrafted on and molded by the broader legal environment in which it finds itself. As a consequence, automobile insurance was originally premised on the concept of protecting a person from economic disaster resulting from legal liability—by defending against claims and paying those adjudged to be valid. Only incidentally was the combination of the legal and insurance systems thought of in terms of providing reparation to the victim. In more recent years, there has been a shift in concept. Increasing attention has been focused on the plight of the victim. The inquiry now centers on how dependent upon fault the reparation system should be.

Obviously, the questions being posed extend far beyond the interests of automobile insurance and its regulation. Numerous groups are interested in the ultimate result. These include the policyholder, the claimants, the legal profession, the providers of medical services, insurers, agents, unions, etc. Because of the many groups involved, the extensive diversity within such groups, and the complexity of the issues involved, a wide range of conflicting attitudes and objectives exists. The NAIC, following a comprehensive background study by its Central Office staff, adopted a position statement which, among other things, said that question of fault upon non fault "is an issue involving wide spread ramifications far beyond the traditional confines and insurance regulations . . .

"The decision as to whether the present system should be reformed is not a legal decision nor is it a statistical one; it is a question of values."

"Thus the type of system adopted is a broad question of public policy.

"Thus NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternative on a state-by-state basis."²

Our responsibility as regulators is a limited one. If private enterprise is chosen as the implementing mechanism (whether the third party legal system is retained, modified, or eliminated), our function would continue to be regulation in the interest of a sound, efficient, and equitable system on behalf of the insurance consuming public.

Incidentally, state insurance regulation has no vested interest in either eliminating or continuing the third party legal liability system for automobile insurance. We currently oversee both fault and no fault type coverages. What is ultimately in the best interest of the public is what we favor and support. The problem is determining what is ultimately in the public interest.

Let me add parenthetically that I personally favor the adoption of no fault laws on a state-by-state basis and that I think the need for such laws is of grave urgency.

¹ House Concurrent Resolution 241, 92nd Congress, 1st Sess. (1971).

² NAIC Statement of Position on Automobile Insurance, *Report of the Special Committee on Automobile Insurance Problems*, June 16, 1969, p. 17. The report was adopted by the NAIC in June 1969. In addition, the report contains the staff background study. A copy of the report is submitted for the record.

3. THE STATE-BY-STATE APPROACH

While we as insurance regulators will not be the ultimate arbiters as to what constitutes the most appropriate reparation system in terms of public policy objectives, we do occupy a unique vantage point for observing the existing system. State insurance departments regulate insurers, examine their operations, approve policy forms, review policyholder and claimholder complaints, and respond to all manner of consumer needs. Consequently, we have a continuing opportunity to closely observe the workings of the insurance mechanism and to do so from the public's viewpoint. Thus, in the sense, as well as from reviewing the studies made by the NAIC, DOT and individual insurance departments, we feel our observations will contribute to your deliberations.

The fault versus no fault concept poses numerous complex and difficult issues. Among the factors requiring primary consideration are finding a means to assure that payments are made promptly, that the distribution of claims payments is an equitable one, and that a greater percentage of each premium dollar is paid out to victims.

In addition, consideration must be given to: overlapping coverages and premiums, flexibility, and impact on rehabilitation. Implicit in these factors are conflicting attitudes and objectives. Public clamor over increased automobile insurance premiums has significantly added to the pressure for change. Proponents of no fault are urging that virtually all injuries be compensated regardless of fault. These are conflicting objectives—i.e. lower cost versus increased benefits. Thus a basic question becomes what benefits the public wants, what benefits the public is willing to forego, and what cost level the public is willing to accept.

The final report of the Department of Transportation, as well as Secretary Volpe's presentation, highlighted the multiplicity of options confronting us and the need for experimentation. For example, the report named six basic areas of consideration, each area involving numerous subconsiderations within itself: (1) the legal rule governing reparations, (2) the role of insurance, (3) the kinds of losses to be compensated, (4) private versus social insurance, (5) compulsory versus voluntary insurance, and (6) insurance and the loss minimization objectives.³ Alternative approaches raised include (1) retain the status quo, (2) improve the present tort legal liability system (e.g. judicial reform, shift to comparative negligence, regulate contingency fees, etc.), (3) rely on evolutionary reform by combining fault and no fault coverages, (4) establish a total no fault system, and (5) utilize government insurance.⁴

In spite of the mass of research conducted, the general public has no clear concept of what is involved or the ramifications posed by the various alternative methods. The DOT report's section on public opinion makes this quite obvious:

"In general, these surveys indicate that *the public has mixed attitudes* about the performance of various aspects of the system, is generally ill-informed about the current system, and, on the whole, shows an openness to change when made aware of alternatives to the present system."⁵ (Emphasis supplied)

In short, a clear and informed consensus has not yet emerged.

With these and other factors in mind, the NAIC has said:

"Because factors, concepts, values, and attitudes vary from locale to locale, this public policy decision can best be made on a state-by-state basis rather than at the federal level. This, in turn, affords the opportunity to test and experiment with different approaches on a limited basis. After a period of experience with different plans, the better solution(s) will emerge. *The NAIC, therefore, opposes the adoption of basic changes in the liability system on a federal level, but encourages experimentation with different alternatives on a state-by-state basis.* Whatever the system, the various state insurance regulators can regulate for the public interest most effectively because of the varied needs of a differing populace in the several states. *The public, by its responses to legislation and by the decisions it makes in the market place in accepting or rejecting various coverages and services offered, will ultimately settle the issue.*"⁶ (Emphasis supplied)

This remains the judgment of the NAIC. Furthermore, it has been subsequently

⁵ *Id.* at 81.

⁶ NAIC Statement of Position, note 2 *supra* at 17.

fortified by both Secretary Volpe's statement before the Senate Commerce committee⁷ and by the DOT report which said:

"Moving in stages toward such a goal would allow us to test its virtues and discover its faults, thereby giving us new knowledge that could serve to modify the goal itself. A little observation is worth a great deal of speculation, and State experience with diverse plans will provide us with that opportunity for pilot project testing which must precede massive reform."⁸

Furthermore, Secretary Volpe said:

"First, it seems clear, at least to us, that *there remains much legitimate uncertainty about how far and how fast the public wants or is willing to go in changing the reparations system*. It is also clear that *there exists genuine and warranted concern as to the unknown and essentially unknowable price and cost implications of any major change in the system*, which of course would ultimately affect the cost and quality of service to consumers of insurance. Regulators and other responsible public officials would appear to share these feelings. We, ourselves, don't claim to have definite answers to these questions either. As a result, it seems to us that we should seek change through State action, but consistent with the broad outlines or principles of a system such as that described below. We need not and do not insist that a single reform system be imposed upon all the States. The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."⁹ (Emphasis supplied)

In brief, we simply don't know at this point what the answer or combinations of answers are. With all due respect to the advocates of the federal no-fault plan, we submit that no one knows the answers to these questions (and others which could be posed)—and until we do, no one knows what final form a national program should take.

4. CAVEATS ON FEDERAL MANDATED STANDARDS AND VOLUNTARY GUIDELINES

Secretary Volpe urged that change commence now and the Administration is supporting a joint concurrent resolution putting the states on notice that they are expected to resolve this problem within a reasonable period of time. We don't disagree that some change is needed, although the magnitude or direction of change is subject to intense debate.

a. *Immediate Uniform Massive Change is Premature.* At the one extreme the proposed Uniform Motor Vehicle Insurance Act would establish rigid statutory standards as to what must be in an automobile insurance policy. Such an approach has the practical effect of destroying flexibility and tends to freeze in limitations in coverage.¹⁰ Perhaps even worse, the uniformity imposed would preclude the consuming public from the opportunity to register its choice over a meaningful period of time and thereby make the insurance mechanism responsible to the public's evolving concept as to the appropriate balance between benefits and costs.

b. *The Cost Factor.* No matter how hard we try, it is either impossible or foolhardy to ignore the ramifications of the cost of any given program or alternative. As the NAIC staff study pointed out:

"In appraising the worth of any system, a very important consideration is the cost of such system as compared to the cost of possible alternatives. Public clamor over increasing automobile insurance premium levels has significantly added to the pressure for change.

"... the NAIC strongly supports efforts to reduce the cost of automobile insurance to the public to the extent that such reductions are consistent with other major objectives. It must be remembered that no program can meet all demands since the demands themselves are frequently in conflict. It is virtually impossible to pay more accident victims more dollars and reduce costs at the same time. Thus, whatever changes are recommended they should be evaluated with a view

⁷ "Nor will I attempt to assess here the relative merits of all the various reform plans that have been offered as alternatives to the present system. In this thicket, there is plainly much less of a consensus; the complexity of the subject and its problems make possible an almost limitless number of combinations, permutations and variations of recovery rules, insurance coverages, etc." Statement of Secretary of Transportation John A. Volpe before the Senate Commerce Committee, March 18, 1971, p. 2.

⁸ DOT Report, p. 133.

⁹ Volpe's statement, note 7 supra at 3.

¹⁰ The chief advantage of a standard policy is that it facilitates prior comparisons. In the past, uniform terms have often led to uniform and non-competitive prices. Competition in policy terms usually leads to more innovative contrasts and broader terms.

towards the best balance possible between conflicting objectives and particularly between the objectives of increased benefits and cost savings."¹¹ (Emphasis supplied)

As the DOT report noted, "consumer attitudes about automobile insurance have shown its cost to lead all other concerns."¹² Consequently any program which does not afford the consumer an opportunity to relate the benefits he desires to the costs he must pay may create more public dissatisfaction than it eliminates.

This point is particularly relevant to a program such as automobile insurance whose costs are bound to increase. The DOT report has recognized:

"Perhaps the most pervasive influence upon automobile insurance as a public issue in recent years has been inflation."¹³

In effect, an automobile insurance company is a mass purchaser of a variety of goods and services such as medical, hospital, lawyer and court services, wage replacements, repair goods and services, etc. As the cost of these elements increase, the cost of insurance must do the same.¹⁴

"If such costs continue to inflate (and there is little reason to hope otherwise), initial cost savings resulting from changing the system would soon be forgotten and public frustration with costs would arise anew. This suggests that, while efficiencies in the system are important, drastic changes aimed at reducing premium levels (or lessening increases) may result in only temporary relief."

Much of the American motoring public is being led to believe that no fault is a panacea, bringing with it broader coverage, payment in all cases, and lower costs. The idea that something must be given up in order to get something else back has not yet registered in many quarters. The passage of the proposed legislation, without a preliminary period of trial and error during which the public would become educated as to its advantages and disadvantages and would be able to relate its wants to its costs by choice in the free market, could set the stage for massive public disenchantment with all who were connected with its enactment.

The establishment of minimum mandatory benefits, such as those being discussed, in a federal statute poses far reaching, long-term ramifications. In fact, the same can be said, although perhaps to a lesser extent, as to the establishment of federal guidelines to which the states should strive since such guidelines would tend to become the minimum norm of consumers' expectations as to what they are "entitled to; by right."

If the cost of such benefits exceeds what the public is willing to pay, federal subsidies may be necessary and you should be prepared to recognize that potential need.

c. Cause for Skepticism. Though we don't question the conviction of the proponents of this proposed federal act as to the rightness of their solution, past experience with massive federal programs entitles us to voice some skepticism. For example, we launched into Medicare and Medicaid without an adequate exploration and testing to ascertain the cost implications; the impact on the delivery of health, etc. The program is now being devoured by expenses, the demand on medical facilities has skyrocketed, and now a few short years later persons are advocating scrapping these programs and launching into something else. In conjunction with national health plans it has been said:

"There must be a critical review not only of the estimated cost of such proposals but with the financing mechanisms as well as with the services which are expected to be provided. At the moment, in the rush to design these new proposals, it appears to be forgotten that the planners of Medicare and Medicaid grossly underestimated the cost of these programs. They also gave little heed to the existing shortage of health manpower and facilities which had been seriously aggravated by these new programs."¹⁵

This observation could apply with equal force to the proposals for federal automobile insurance reform. Forecasts as to the costs of this system are necessarily conjectural. It is only by a process of trial and error that the public will ascertain the true costs and only by experimental efforts at the state level can the best solution be found and earlier mistakes more readily rectified before they assume unmanageable proportions.

¹⁵ NAIC report, note 2 *supra* 108.

¹⁶ Wheatley, "Promises and Problems of National Health Insurance," an address before the American Pension Conference, N.Y., N.Y., March 1971.

This example, as well as other examples which could be named, is not cited in criticism of the results which were sought but rather as an example of what occurs when massive federal involvement and planning on a nationwide uniform basis in complex areas precedes or supersedes the market mechanism as an allocator of economic resources. Original concepts which were so convincingly put forth have often proved to be wrong, but the adverse consequences of the error have been "frozen in" over a period of time.

Let's avoid making a similar mistake as to automobile insurance, which involves 100 million automobile drivers and nearly all American families. This is the message Secretary Volpe is conveying when he emphasizes the need for experimentation. Certainly the Ontario Experience—where motorist rejected coverage combining the fault and no fault concepts put forth on a voluntary basis—should give one pause in mandating a fixed uniform standard on a nationwide basis.

d. *Federal Guidelines.* Although we support the state-by-state approach of the Administration, we do have reservations concerning the adoption of federal guidelines or objectives such as those in the proposed concurrent resolution. Such standards, in addition to the concern previously mentioned above as to the creation of certain expectations, tend to prejudge what the market place has not yet passed upon—e.g. the choice of an essentially no fault over a reformed fault system, the determination that automobile insurance should be the primary coverage, etc. Such standards tend to restrict the range in which proposed changes would fall and hence the range of consumer choice. This does not say that the choices implicit in the standards proposed are incorrect but rather they are premature. If there are to be minimum federal standards, we feel that broader standards which give greater meaning to experimentation should be adopted. The minimum criteria for any automobile insurance system as stated by the NAIC in its Statement of Position on Automobile Insurance could be a sample of the kind of federal standards that would be meaningful.¹⁷ Nevertheless, a resolution by Congress expressing both the need and its will for prompt state action in exploring, testing and implementing improvements in the existing system would be an appropriate indication of the sense of Congress. This would serve notice on both the business and the states that progress is expected.

5. A TIME FOR CHANGE AND CURRENT MOMENTUM

All of this is not to argue for the status quo, nor to minimize the impact of the landmark DOT study, congressional hearings, academic works, state insurance departments' efforts and NAIC research. Quite to the contrary, each of these have significantly contributed to the emerging consensus that improvements are needed and have pointed out possible directions which should be considered and tested. Furthermore, the NAIC supports the Administration's position of recognizing not only the worth but the virtual necessity of a state-by-state approach until a clearer picture emerges as to the right answers—an answer which may vary from state to state or region to region.

To some proponents of the Uniform Motor Vehicle Insurance Act, the state-by-state approach is tantamount to doing nothing. This is incorrect. In addition to the "prod" from Congress in the form of a Congressional resolution, the states are receiving the same pressures for change that Congress receives. Few if any argue for the status quo. The basic research study is done. As of the early part of this month, we understand that no less than 28 states are now considering no fault or modified no fault legislation. (Other states have created study commissions. Some may be waiting to capitalize on the experimentation of others and others no doubt are waiting to see if Congress is going to preempt the field or give the states time to act.) The proposals range from the complete no

¹⁷ "Whatever is decided as to the appropriate legal framework, the NAIC believes that any automobile insurance system should include as a minimum the following elements:

(a) ready access to insurance for all licensed drivers at prices which are reasonable, with a means to purchase insurance through an assigned risk mechanism for those who cannot purchase it in the voluntary market.

(b) provision for prompt payment of basic economic loss and improved claims procedures.

(c) provision for protection from insolvencies, uninsured motorists and hit-and-run drivers, etc.

(d) meaningful classifications which are broad enough to spread risks and yet not so broad as to lessen availability of coverage.

(e) a responsive and meaningful pricing and marketing system.

(f) protection for the insured against arbitrary and unfair cancellation and nonrenewal.

(g) full disclosure of the nature of the coverage to the purchaser."

fault program of the American Automobile Insurance Association to those which primarily seek to improve the existing legal liability system such as the American Trial Lawyer's Reform package with all sorts of variations in between.

Secretary Volpe, in his statement before the Senate Commerce Committee said: "Further change in the auto reparation system at the state level has clearly moved off dead center and would appear to be achieving some momentum. I could not have made that statement a year ago. I think this constructive move should be encouraged, perhaps guided and helped but not preempted by federal action."¹⁵

The activities mentioned above support the basis for the Secretary's beliefs and clearly demonstrate the heightened momentum. At this point, with so many different and sometimes conflicting ideas "floating around," and so much uncertainty as to what should be done, it is too early to predict what the states will and will not do. But events are moving sufficiently so, in our judgment, to warrant giving the states an adequate opportunity to act. If past experience is any guide, a variety of approaches will be tested and the best features of the various programs will emerge. At that point, the trend will be towards a more uniform system throughout the various states.

Of course, during the period of experimentation, we would be going through a phase when a number of different plans would be used in a number of different states. America is a mobile nation. Complications can be expected in the administration of a system as significant portions of the public journey across state lines. During this period, insurers operating across state borders will have to provide for the variation in coverage through appropriate endorsements. It will present some administrative problems for the insurers and regulatory problems for the states. But this is a small price to pay compared to the damage which could occur if an ill-considered national program was imposed upon the nation in one installment from the top.

6. FEDERAL REGULATORY INTERVENTION

Although most attention on the proposed Uniform Motor Vehicle Insurance Act has focused on the mandating of the no fault concept, the Act poses another fundamental issue—i.e. state versus federal regulation of automobile insurance. There can be no mistake as to the pervasive regulatory power vested in the Secretary of Transportation. For example, the Secretary would (1) determine and approve the financial substitutes for insurance (i.e. bonds, self insurance), (2) determine by rules and regulations the percentage of responsibility for net economic loss assigned to motor vehicles larger than ordinary passenger cars, (3) approve policy terms, conditions, exclusions, and deductibles, (4) promulgate a uniform statistical plan for compilation of claims and loss experience which every insurer must follow, (5) require standard uniform and standard minimal policy provisions, classes of risks, and rating territories, (6) prescribe rules and regulations under which insurers would submit premiums being charged for each class of risk in each rating territory, (7) make available a comparison of insurers' rates based upon claim and loss experience, (8) organize an assigned claims bureau in each state, and (9) make, amend, and repeal rules and regulations as he deems necessary.

Under existing state law, the insurance department possesses comprehensive regulatory authority over insurers doing business therein. For example, state regulation encompasses these elements: (1) the incorporation of companies (qualifications, capital and surplus requirements, etc.), (2) the specification of required reserves, (3) the specifications of the areas in which insurance assets may be invested, (4) the approval of policy forms, (5) the supervision or monitoring of rates (for adequacy, excessiveness and non-discrimination), (6) the collection of statistics and the making of reports, (7) the examination of companies to determine if reserves are adequate, investments comply with the law, claim practices are satisfactory, etc., (8) the licensing and supervision of those who sell insurance, and (9) provision for residual coverages such as the assigned risk plans.

The regulatory overlap is substantial and clear. Confusion, waste, an increasingly complex system, and extra cost to the taxpayer in administering the automobile insurance is bound to result. We submit that such a dual system is not in the public interest.

¹⁵ Volpe's statement, note 7 supra at 4.

In this connection, it should be pointed out that the DOT report recognized that: ". . . the basic determinant of the size and nature of the compensation requirement, i.e., car crash losses, is almost entirely, if not completely, a function of outside forces—traffic law enforcement, safety measure, car design, driver licensing and education, highway design, etc. Loss costs, themselves, reflect the prices being charged in the market place for hospital and medical care, auto repair and replacement parts, legal services, the cost of vehicles, etc., and they, too, cannot be significantly influenced, at least directly, by the compensation mechanism."¹⁹

The NAIC earlier reached the same conclusion.

"(Traffic safety or the absence thereof, the economic climate within which automobile insurance functions and the legal system upon which it rests) have a fundamental impact on the cost and the operation of the automobile insurance system despite the fact that they are external to the system and not subject to that system's control. Nevertheless they comprise the framework within which the system functions. Although the insurance system has its defects, some of the basic problems are caused externally and can only be remedied outside the system. Congress, various federal agencies and administrations, the judicial system, the providers of medical services, the automotive industry, state activity or lack thereof in traffic safety, etc., all have contributed to the basic problems."²⁰

Thus the insurance industry and the regulators thereof have had to function in a legal, social and economic environment not of its own choosing. The problems stemming from this environment should not be translated into discarding those operating within it as long as they commit themselves to adjust to a new environment when it comes about. The DOT report, at the outset, made this same point:

"The conclusions made about the present system and its operations should not be interpreted to reflect adversely on any of the participants. The subject under investigation was in fact the 'system' and not those who have tried to make it run and improve it. The conclusions are directed to the system."²¹

Furthermore, the Administration in the proposed resolution stated that "the principal problems and abuses with respect to automobile insurance stem from the defects in the system for compensating accident victims . . . rather than from defects in the insurance institution or in its regulation by the several states . . ." Consequently, shifting to a federal regulatory mechanism (even if federal guidelines or objectives are adopted) is not warranted nor recommended by the comprehensive studies made. As indicated earlier, the state insurance regulating mechanism has no vested interest other than its commitment to meeting the public needs in the extent to which the tort liability system is modified or eliminated. We regulate the providing of insurance now and can continue to do so on either a fault or no fault basis on either basis.

7. A PRACTICAL NOTE

As has been aptly pointed out elsewhere and referred to in this statement, inflation has been the prime cause in rate increases. Thus the basic responsibility for the problem generated rests in Washington. Public expenditures, increase in governmental activities, deficits, monetary policy, taxation, etc., all (with the exception of monetary policy) under the control of Congress largely determines the presence or absence of inflation.

This is not to say that improvements cannot or should not be made in the insurance mechanism at the state level. They should be made and they are being made. But the respite will only be temporary if inflation continues to take its inexorable toll. Efforts by Congress to deal with inflation, often hampered by political considerations, have not been effective thus far and there is national pessimism about the likelihood of any improvement in the picture.

SUMMARY—MASS MARKETING OF AUTOMOBILE INSURANCE

To summarize, the initial draft of the NAIC staff study on mass marketing suggests:

1. that insurance consuming public ought to be afforded the freedom of choice.
2. that pressures and events are moving in this direction now.

In addition, I personally believe:

1. that federal legislation of this type, if adopted, needs to be carefully considered so as to: a) adequately protect the total insurance buying public and at the same time not create burdensome and conflicting regulatory machinery

¹⁹ DOT Report, p. iv.

²⁰ Report of the NAIC Special Committee on Automobile Insurance Problems, 15 (June 1969).

²¹ DOT Report, p. iv.

and b) avoid preemption or to take precedence over state actions that may encourage experimental and pilot programs.

2. that S. 946 has some inherent defects working at cross purposes to the achieving of the basic objective of providing the insurance consuming public with a free choice within a responsible insurance market and that before adoption of such an Act you should correct the defects.

SUMMARY—DAMAGEABILITY STATEMENT

In summary, the NAIC believes that auto insurance ratemaking based on relative susceptibility to property damage in an accident, if perfected, offers a significant contribution to *equitable distribution of rates* among insureds and anticipates that a program such as one embraced by S. 976, whether enacted at the Federal or state level, offers significant potential for cost relief to automobile owners and policyholders.

Senator Moss. Mr. Peter Beardsley, vice president and general counsel of the American Trucking Association will be our witness now. We will be glad to hear from you, Mr. Beardsley.

STATEMENT OF PETER T. BEARDSLEY, VICE PRESIDENT AND GENERAL COUNSEL, AMERICAN TRUCKERS ASSOCIATION

Mr. BEARDSLEY. Thank you, Senator.

Senator Moss. We will make your full statement a part of the record, and you may proceed in whatever manner you care to.

Mr. BEARDSLEY. All right, Senator. When I get to some of the statistical figures, I will refer to them, but not read them in.

Senator Moss. Thank you. That will be very acceptable.

Mr. BEARDSLEY. My name is Peter T. Beardsley, and I am a vice president, and the general counsel of American Trucking Association, Inc. Our organization is the national trade association of the motor carrier industry. It represents all types of motor carriers, and has affiliated associations in every State and the District of Columbia. Its office is located at 1616 P Street NW., Washington, DC 20036.

As a part of our activities, we often take a position before Congress respecting proposals which, if enacted, would have a significant impact upon the trucking industry. Ordinarily, such proposals are the same as, or very similar to, others which have preceded them, or propose amendments to existing laws with which we are familiar.

We confess to a lack of familiarity, however, with no-fault insurance, if for no other reason than that the subject itself—at least in the form of proposed legislation—is relatively new. We assume that no-fault means essentially that regardless of the degree of negligence exhibited by the various drivers involved in an accident, each of them would be paid by his insurer for his net economic loss as that term is defined in S. 945.

Based on that assumption, we take no position at this time respecting the no-fault principle as such.

We believe that in view of the every substantial change which this bill proposes in the field of motor-vehicle accident insurance, it would be wise before seriously considering its enactment to await the results of experience under State no-fault laws such as that which recently became effective in Massachusetts, and those of other States which may be enacted.

In any event, S. 945 is not, in any practical sense, no-fault insofar as the trucking industry is concerned, and we have no alternative but to oppose it for that reason. If the bill were amended along the

lines of H.R. 7514, introduced by Chairman Moss of the Subcommittee on Commerce and Finance of the House Committee on Interstate and Foreign Commerce, we would find it much less objectionable.

We take no position on S. 946 or S. 947, or the resolution proposed by Secretary Volpe in his testimony before this committee on March 18, 1971, which is, I believe, Senate Concurrent Resolution 23.

Senator Moss. Yes.

Mr. BEARDSLEY. The interstate motor carriers subject to economic regulation by the Interstate Commerce Commission, and safety regulation by the Department of Transportation, fall into several categories. Over 15,000 for-hire carriers—common and contract—are subject to both economic and safety regulations.

There are additional thousands of for-hire carriers—mostly transporters of agricultural commodities—which are subject to safety regulation by DOT but exempt from ICC economic regulation. It is on behalf of the regulated carriers, rather than the exempt carriers that this statement is filed.

ATA also represents the interests of numerous private carriers of property through their membership in one or more of the ATA-affiliated State trucking associations, and this statement is filed on their behalf, too.

The trucking industry's concern for highway safety originated in a natural, humanitarian desire to reduce the tragedy of death and injury in traffic, and in a determination to improve the reputation of the industry as a safe, courteous partner on the road.

In addition, there is a business incentive for maintaining an extensive safety program. The millions of trucks of all kinds in daily use on streets and highways are constantly exposed to accident-producing situations which can result in loss or damage to other highway users, to industry drivers and vehicles, and to customer freight.

Such accidents have the potential of putting any motor carrier out of business because of the extremely high costs that are incurred through civil suits, workmen's compensation, vehicle repairs, and freight claims. Those costs are direct expenses to the carrier, regardless of the amount of its insurance coverage as truck insurance is written on a retrospective basis so that the premium for a given year is raised or lowered to reflect the accident cost experience for the previous year.

The loss potential faced by truck fleets and the retrospective method of rating insurance have been incentives for the conduct of carefully planned programs to prevent accidents.

Industry experience shows that driver selection is the key to the entire safety program, and so trucking companies try to insure that they do not "Hire their problems." In employment interviews and reference checks of prospective drivers, personnel officials use nationally approved guidelines which prescribe rigorous qualifications. Past employment, credit background, and traffic record are among the factors explored to determine an applicant's reliability, attitude, and willingness to accept responsibility for his vehicle and cargo, and for the welfare of other highway users.

The industry's driver selection program had its beginnings in the 1920's and was adopted as a national standard in 1940. In the 1950's it was further improved through an industry-sponsored study by the School of Public Health of Harvard University which was designed to provide more information about driver motivation.

After being hired, a driver trainee receives detailed classroom instruction in company policies, traffic regulations, safety requirements, knowledge of the vehicle, and techniques for safe driving.

To develop driving proficiency, he undergoes a lengthy probationary period starting with student trips in the company of an experienced driver. He learns how to handle smaller trucks at first, and eventually may drive an intercity tractor-trailer rig.

Throughout his employment, industry and fleet supervision is provided through road patrols, radar checks, safety meetings and conferences, and the use of recording devices and check stations.

The professional truckdriver is required to allow the code of defensive driving, which places responsibility upon him to drive in such a way that he commits no driving errors himself, and can protect himself against the mistakes of other drivers.

If he is involved in an accident his company rules the accident as preventable, or nonpreventable. A preventable accident is one in which the truck driver did not take every possible step to prevent the accident, regardless of whether or not he was legally in the right, and the other driver was legally wrong.

Under this concept of preventability the driver's attitudes and actions are brought under close scrutiny and control by the company, so that the driver who develops poor attitudes or poor driving habits is quickly retrained or released from employment.

The effectiveness of the industry's programs is reflected in the following National Safety Council accident figures:

| | Percent of trucks involved in accidents | Truck percent of registered vehicles | Percent of cars involved in accidents | Car percent of registered vehicles |
|-----------|---|--------------------------------------|---------------------------------------|------------------------------------|
| Year: | | | | |
| 1948..... | 17.0 | 12.0 | 80.0 | 81.0 |
| 1969..... | 11.5 | 16.6 | 88.1 | 80.8 |

These figures are taken from the National Safety Council's publication Accident Facts, 1949 and 1970 editions, pages 66 and 56, respectively. They demonstrate that the truck record for accident involvement has improved substantially over the period shown, whereas that of the passenger car has gotten worse.

The figures shown do not reflect mileage driven. When this factor is considered, the truck record is significantly better than that of the passenger cars. This is demonstrated by the following figures:

| | |
|--|-----------------|
| Intercity fleets: Total truck mileage..... | 12,460,796,451 |
| (Class I and II). (Ratio: 3.15 trucks involved per million miles): Total trucks involved in accidents..... | 39,302 |
| All trucks (ratio: 14.9 trucks involved per million miles): | |
| Total truck mileage..... | 206,680,000,000 |
| Total trucks involved in accidents..... | 3,075,000 |
| All passenger cars (Ratio: 26.8 passenger cars involved per million miles): | |
| Total passenger car mileage..... | 849,633,000,000 |
| Total cars involved in accidents..... | 22,800,000 |

The class I and II trucks referred to in the first category are those for-hire vehicles subject to economic regulation by the Interstate Commerce Commission, and safety regulation by the Department of

Transportation. The mileage and accident figures are obtained from the pamphlet, "1969 Accidents of Large Motor Carriers of Property," Bureau of Motor Carrier Safety, Department of Transportation.

A class I carrier is one whose annual gross operating revenue is \$1 million or more. A class II carrier is one whose annual gross operating revenue is \$300,000, but less than \$1 million. The second category "all trucks," covers just that. It includes, for example, farm trucks, trucks operated by the Federal Government, as well as a very large number of trucks not subject to economic regulation by the ICC, but subject to DOT safety regulation.

The mileage figures for both the second and third categories are those of the Department of Transportation—Highway Statistics, 1969, table VM-1, page 73—and the accident figures are those of the National Safety Council—Accident Facts, 1970 edition, page 56. 1969 figures are used, as they are the latest available from all sources.

The effect of the industry's safety programs has been to enable motor carriers to significantly reduce the heavy costs of accident involvement. But even though the carriers have done an outstanding job of controlling their vehicles and drivers, there are still a large number of truck accidents each year that are caused by others. A study by American Fidelity and Casualty Co. of truck-involved accidents in the 1950's showed that in 104,000 accidents with other vehicles, truckdrivers could not in any way have prevented 70 percent of them.

Over the years, the trucking industry has been in the forefront of highway user groups which have made a consistent and conscientious effort to reduce their contribution to highway accidents. That effort has involved the expenditure of large sums of money and a great deal of time and work.

Now it is proposed that the cost of highway accidents be assigned, not to those responsible for them, but to all highway users, without regard to their driving habits, or their concern for their own welfare, or that of other users of the road.

If there is to be a shift to a no-fault basis, we submit that if any segment of highway users should be singled out for favored treatment, it should be the motor carriers. But instead of being rewarded for their successful efforts to reduce highway accidents, S. 945 would subject them to discriminatory treatment.

We don't ask for favors, but we do ask for fair treatment. If the law is to provide that, except for catastrophic loss, no driver involved in an accident is to be considered responsible for it, the same rule should apply with respect to drivers of commercial vehicles.

There is certainly no equity in arbitrarily assigning to such vehicles a very high percentage of the costs resulting from any accident in which it is involved. The proposal is indeed a paradox—on the one hand, operators of commercial vehicles are told that no matter how negligent automobile drivers may be, they bear no responsibility when then cause an accident in which the operator's trucks are involved, but the truckowners will be assessed a major share of the cost resulting from the very same accidents. Technically, this may be no-fault insurance; practically, it is insurance which arbitrarily assigns a great majority of the blame and cost to operators of commercial vehicles involved in accidents.

Under the current fault system of compensating for accident losses, motor carriers usually bear all or part of the accident costs if their driver contributed in any degree to an accident. However, the system quite often protects the carriers when other drivers are totally responsible. Thus the present system provides incentive to the carriers to continue their programs of careful driver selection, training, and supervision, and it keeps insurance costs at a point which the carriers can afford and still stay in business.

To the contrary, section 5(7)(A) and (B) of S. 945 would hold motor carriers uniformly liable for a large percentage of all property damage and personal injury regardless of whether or not their trucks were actually responsible for accidents. This would result in discrimination against trucks because, through millions of miles of operation, they are constantly exposed to accidents resulting from the driving errors of others.

The truckdriver is a skilled professional who must meet strict physical requirements every 2 years and who is limited to a maximum of 10 hours of driving in any one duty period. The vehicle he operates is a highly sophisticated machine that is the subject of regularly scheduled inspections and preventive maintenance. Yet, on the highway, he is exposed to drivers who have varying degrees of ability and who quite often are pushing their stamina by attempting to cover 10, 15, and 20 hours of driving following an 8-hour workday.

The truckdriver is exposed to driving mistakes by the very young neophyte driver whose attitudes lack maturity, by the older driver who may lack the physical conditioning necessary to safe driving at high speeds, and, because a very substantial amount of over-the-road trucking occurs at night, to the drunken driver. As a result of this exposure, there is a strong likelihood that even the best and most defensive truckdriver can become involved in an accident that he can in no way avoid.

Under the provisions of this bill, the costs of such accidents would be largely borne by the motor carriers and their insurance costs would rise very substantially.

As an example of the inherent inequity of this bill which would hold the commercial vehicle largely or almost entirely responsible for an accident involving a passenger car, consider the cost results of an accident under the present system versus the system proposed by the bill:

(a) Truck and trailer unit, westbound, in extreme right lane of four-lane divided highway.

(b) Passenger car with four occupants, eastbound, loses control, comes through the dividing median and collides with the truck.

RESULT—ALL OCCUPANTS OF CAR SEVERELY INJURED. NO INJURY
TO TRUCKDRIVER

Present system

Based on the premise that one who causes injury to another by negligent conduct should fairly and adequately compensate him for that injury, the truck operator would owe nothing.

S. 945

This bill requires payment of up to \$1,000 per month for a total of 30 months for loss of earnings resulting from an accident, with no

specified limits on costs for medical, hospital, surgical, et cetera, services, and physical and occupational therapy and rehabilitation.

Assuming that the injured parties in this accident were disabled many months each, the total cost for the injuries could well be in the hundreds of thousands of dollars, by virtue of the expenses covered by economic loss under section 2(10) of the bill.

Under the terms of S. 945 (sec. 5(7)(A)) by which a larger vehicle, depending on its size, would be responsible for a substantial percentage of net economic loss, it is possible that the motor carrier would be required to pay upward of 90 percent of the loss incurred by the occupants of the passenger car.

While we assume the figure would be somewhat lower, the bill gives the Secretary of Transportation (sec. 5(7)(B)) complete discretion to assign to vehicles larger than an "ordinary passenger automobile" a percentage of responsibility for net economic loss sustained by occupants of other vehicles. And the bill clearly indicates, in the same section, that the Secretary could determine that such responsibility would exceed 70 percent.

The definition of "ordinary passenger automobile" contained in the bill (sec. 5(7)(A)(i)) includes vehicles having a seating capacity of up to nine passengers. It is, therefore, clear that the cited example of costs which might be incurred by motor carriers because their vehicles are involved in accidents for which—under the present system—they could not be held responsible, is modest indeed.

S. 945 is contrary to the principle of no-fault insurance because it would penalize motor carriers by placing them under a fault system of insurance rather than a no-fault system. It would hold the carriers responsible for losses incurred by all parties to all accidents involving trucks as if the carriers' vehicles are always responsible for such accidents.

One of the claims made for no-fault insurance is that premium costs will be reduced, but S. 945, if enacted, would tremendously increase the costs of truck insurance because of the larger portion of accident costs that would be borne by insurance companies which supply truck insurance.

Under the retrospective rating plan, those costs will be shifted back to the motor carriers through an increase in premiums. The regulated for-hire trucking industry includes approximately 1,500 class I carriers, 2,000 class II carriers, and, in addition, 11,700 class III carriers (those whose annual gross revenues are less than \$300,000 and whose fleets consist of a small number of vehicles).

All for-hire carriers operate on a very slim profit margin and many would be unable to absorb a sharp rise in insurance costs. The industry is faced with severe competition from railroads, airlines, freight forwarders, and, to some extent, water carriers. Because of the competition of other transport modes, for-hire carriers are by no means completely free to recoup increased expenses by increases in their rates.

I referred earlier to H.R. 7514, introduced in the House by Congressman Moss of California. As we read his bill, it would eliminate the provision of S. 945 which would require that large vehicles be charged with a very substantial portion of the costs of all accidents in which they are involved, which is the very antithesis of the no-fault principle.

Let me say that we earnestly hope—if Federal no-fault insurance legislation is enacted—it will follow the lines of H.R. 7514 in this respect.

There is another aspect of S. 945 which seems entirely out of keeping with the no-fault philosophy. I refer to section 5(5), providing that persons not occupants of motor vehicles may recover their net economic loss from the insurer of any motor vehicle involved in an accident.

First off, we think the approach suggested by Secretary Volpe in his appearance before this committee on March 18, 1971, is preferable. As we understand his proposal, the insurance coverage obtained by a motor vehicle owner would cover himself and all members of his family whenever they were involved in a motor vehicle accident, whether in the owner's vehicle, as occupants of another vehicle, or as pedestrians. This would leave the owner's insurance company additionally liable only for injury or death to uninsured passengers or pedestrians.

But this is not our main objection to section 5(5). We believe its language is so broad as to allow recovery by any member of a train crew, or passenger on a train, from the insurer of any motor vehicle involved in a grade-crossing accident.

Just as S. 945 requires owners of passengers cars and operators of trucks and buses to provide insurance to cover the net economic loss suffered by occupants of their vehicles, it should also require the railroads to assume the same obligation with respect to members of train crews and passengers on trains. This is no minor matter.

Statistics published by the Department of Transportation show the following respecting grade-crossing accidents, and fatalities and injuries resulting therefrom, for the years 1967–69.¹

| | Number of
accidents | Fatalities | Injuries |
|-----------|------------------------|------------|----------|
| Year: | | | |
| 1967..... | 3,932 | 1,632 | 3,812 |
| 1968..... | 3,816 | 1,546 | 3,744 |
| 1969..... | 3,774 | 1,490 | 3,669 |

If no-fault is to be the standard for recovery of net economic loss in accidents involving motor vehicles, railroads cannot in fairness be given a free ride at the expense of owners of passenger cars, trucks and buses.

Under S. 945 as presently worded, the Secretary of Transportation might well decide, in exercising his authority under section 5(7) (A), to assign 75 percent of the net economic loss incurred by a passenger-car driver in an accident with a truck or bus to the insurer of the latter vehicles. If the bill is enacted with this provision included, then, by the same token, it should vest the same authority in the Secretary to assign responsibility—on a similar basis—to railroad equipment involved in accidents with passenger cars, trucks and buses.

Senator Moss, that completes my direct statement.

Thank you very much.

Senator Moss. Well, thank you, Mr. Beardsley, for that fine statement.

¹ Accident Bulletin No. 138, Federal Railroad Administration, table 6, p. 2.

I understand the objection that you have to the bill S. 945. The others you didn't comment on and didn't have any matter to present.

In this discussion that you had on the training of drivers, and therefore incentive to forestall accidents, to drive safely, don't insurance costs vary among companies depending on the record that they make of accidents?

Mr. BEARDSLEY. They surely do. Because of the retrospective system that I mentioned, Senator, if a company has a bad record, it is reflected next year in its premium.

Senator Moss. So that sort of incentive would remain even if commercial trucks were required to continue to buy insurance; there would still be a great incentive to train drivers for safe driving, wouldn't there?

Mr. BEARDSLEY. I would hope there always would be regardless of what the state of the law was insurancewise or otherwise. That is the way it ought to be.

Senator Moss. I would hope so, too, and I would expect there would be, but I was just pointing out that some economic incentive would remain there for the companies to do that. But other than the concern that you have that trucks are treated differently from passenger cars, you don't find any great difficulty with the bill. Is that right?

Mr. BEARDSLEY. No, sir. As I said at the outset of my testimony, this is something fairly new for ATA to be getting into. I recall this is the first time we had occasion to testify with respect to any legislation dealing with insurance, certainly in the Congress. And we are sort of feeling our way along, if I may say so.

We have a meeting of our executive committee coming up after the middle of June and we are going to put this subject on the agenda for further consideration. I have no way of knowing what the results will be, it may be just where we stand today, we may get some instructions to take a broader approach, so to speak. But so far our only instructions are to oppose S. 945 because of the provisions I stressed in my testimony.

Senator Moss. Well, we surely appreciate your coming and we hope that when you have further considered it, if you arrive at a policy decision, you will communicate it to the committee and we will probably still be deeply involved in this, and when our transcript of our hearings is printed up, and you study them, if you have additional comments you think you would like to submit based on that, we would appreciate having that from you, too.

Mr. BEARDSLEY. Thank you very much.

Senator Moss. Thank you, Mr. Beardsley.

We appreciate your appearance here today.

(The statement follows:)

STATEMENT OF PETER T. BEARDSLEY, VICE PRESIDENT AND GENERAL COUNSEL,
AMERICAN TRUCKING ASSOCIATIONS, INC.

Mr. Chairman and Members of the Subcommittee:

My name is Peter T. Beardsley, and I am a Vice-President, and the General Counsel of American Trucking Associations, Inc. Our organization is the national trade association of the motor carrier industry. It represents all types of motor carriers, and has affiliated associations in every state and the District of Columbia. Its office is located at 1616 P Street, N.W., Washington, D.C. 20036.

As a part of our activities, we often take a position before Congress respecting proposals which, if enacted, would have a significant impact upon the truck-

ing industry. Ordinarily, such proposals are the same as, or very similar to, others which have preceded them, or propose amendments to existing laws with which we are familiar. We confess to a lack of familiarity, however, with "no-fault" insurance, if for no other reason than that the subject itself—at least in the form of proposed legislation—is relatively new. We assume that "no-fault" means essentially that regardless of the degree of negligence exhibited by the various drivers involved in an accident, each of them would be paid by his insurer for his "net economic loss" as that term is defined in S. 945. Based on that assumption, we take no position at this time respecting the "no-fault" principle as such.

We believe that in view of the very substantial change which this bill proposes in the field of motor-vehicle accident insurance, it would be wise before seriously considering its enactment to await the results of experience under State "no-fault" laws such as that which recently became effective in Massachusetts, and those of other States which may be enacted.

In any event, S. 945 is not, in any practical sense, "no-fault" insofar as the trucking industry is concerned, and we have no alternative but to oppose it for that reason. If the bill were amended along the lines of H.R. 7514, introduced by Chairman Moss of the Subcommittee on Commerce and Finance of the House Committee on Interstate and Foreign Commerce, we would find it much less objectionable.

We take no position on S. 946 or S. 947, or the resolution proposed by Secretary Volpe in his testimony before this Committee on March 18, 1971.

The interstate motor carriers subject to economic regulation by the Interstate Commerce Commission, and safety regulation by the Department of Transportation, fall into several categories. Over 15,000 for-hire carriers (common and contract) are subject to both economic and safety regulation. There are additional thousands of for-hire carriers (mostly transporters of agricultural commodities) which are subject to safety regulation by DOT but exempt from ICC economic regulation. It is on behalf of the "regulated" carriers, rather than the "exempt" carriers that this statement is filed. ATA also represents the interests of numerous private carriers of property through their membership in one or more of the ATA-affiliated State trucking associations, and this statement is filed on their behalf too.

The trucking industry's concern for highway safety originated in a natural, humanitarian desire to reduce the tragedy of death and injury in traffic, and in a determination to improve the reputation of the industry as a safe, courteous partner on the road.

In addition, there is a business incentive for maintaining an extensive safety program. The millions of trucks of all kinds in daily use on streets and highways are constantly exposed to accident-producing situations which can result in loss or damage to other highway users, to industry drivers and vehicles, and to customer freight. Such accidents have the potential of putting any motor carrier out of business because of the extremely high costs that are incurred through civil suits, workmen's compensation, vehicle repairs and freight claims. Those costs are direct expenses to the carrier, regardless of the amount of its insurance coverage, as truck insurance is written on a retrospective basis so that the premium for a given year is raised or lowered to reflect the accident cost experience for the previous year.

The loss potential faced by truck fleets and the retrospective method of rating insurance have been incentives for the conduct of carefully planned programs to prevent accidents.

Industry experience shows that driver selection is the key to the entire safety program, and so trucking companies try to insure that they do not "hire their problems." In employment interviews and reference checks of prospective drivers, personnel officials use nationally approved guidelines which prescribe rigorous qualifications. Past employment, credit background, and traffic record are among the factors explored to determine an applicant's reliability, attitude and willingness to accept responsibility for his vehicle and cargo, and for the welfare of other highway users.

The industry's driver selection program had its beginning in the 1920's and was adopted as a national standard in 1940. In the 1950's it was further improved through an industry-sponsored study by the School of Public Health of Harvard University which was designed to provide more information about driver motivation.

After being hired, a driver trainee receives detailed classroom instruction in company policies, traffic regulations, safety requirements, knowledge of the vehicle and techniques for safe driving. To develop driving proficiency he undergoes a lengthy probationary period starting with student trips in the company of an experienced driver. He learns how to handle smaller trucks at first, and eventually may drive an intercity tractor-trailer rig.

Throughout his employment, industry and fleet supervision is provided through road patrols, radar checks, safety meetings and conferences, and the use of recording devices and check stations.

The professional truck driver is required to follow the code of "defensive driving," which places responsibility upon him to drive in such a way that he commits no driving errors himself and can protect himself against the mistakes of other drivers. If he is involved in an accident his company rules the accident as "preventable" or "non-preventable." A preventable accident is one in which the truck driver did not take every possible step to prevent the accident, regardless of whether or not he was legally in the right and the other driver was legally wrong. Under this concept of preventability the driver's attitudes and actions are brought under close scrutiny and control by the company so that the driver who develops poor attitudes or poor driving habits is quickly retrained or released from employment.

The effectiveness of the industry's programs is reflected in the following National Safety Council accident figures:

| Year | Percent of trucks involved in accidents | Truck percent of registered vehicles | Percent of cars involved in accidents | Car percent of registered vehicles |
|-----------|---|--------------------------------------|---------------------------------------|------------------------------------|
| 1948..... | 17.0 | 18.0 | 80.0 | 81.0 |
| 1969..... | 11.5 | 16.6 | 85.1 | 80.8 |

These figures are taken from the National Safety Council's publication, "Accident Facts," 1949 and 1970 editions, pp. 68 and 56, respectively. They demonstrate that the truck record for accident involvement has improved substantially over the period shown, whereas that of the passenger car has gotten worse. The figures shown do not reflect mileage driven. When this factor is considered, the truck record is significantly better than that of the passenger cars. This is demonstrated by the following figures:

| | | |
|---|---|-----------------|
| Intercity fleets
(Class I and II)..... | Total truck mileage..... | 12,460,796,451 |
| | Total trucks involved in accidents..... | 39,302 |
| | Ratio of trucks involved per million miles..... | 3.15 |
| All trucks..... | Total truck mileage..... | 206,680,800,000 |
| | Total trucks involved in accidents..... | 3,075,000 |
| | Ratio of trucks involved per million miles..... | 14.9 |
| All passenger cars..... | Total passenger car mileage..... | 849,633,000,000 |
| | Total cars involved in accidents..... | 22,800,000 |
| | Ratio of passenger cars involved per million miles..... | 26.8 |

The Class I and II trucks referred to in the first category are those for-hire vehicles subject to economic regulation by the Interstate Commerce Commission and safety regulation by the Department of Transportation. The mileage and accident figures are obtained from the pamphlet, "1969 Accidents of Large Motor Carriers of Property," Bureau of Motor Vehicle Safety, Department of Transportation. A Class I carrier is one whose annual gross operating revenue is \$1 million or more. A Class II carrier is one whose annual gross operating revenue is \$300,000 but less than \$1 million. The second category "all trucks," covers just that. It includes, for example, farm trucks, trucks operated by the federal government, as well as a very large number of trucks not subject to economic regulation by the ICC, but subject to DOT safety regulation. The mileage figures for both the second and third categories are those of the Department of Transportation (Highway Statistics, 1969, Table VM-1, p. 73), and the accident figures are those of the National Safety Council (Accident Facts, 1970 ed., p. 56). 1969 figures are used, as they are the latest available from all sources.

The effect of the industry's safety programs has been to enable motor carriers to significantly reduce the heavy costs of accident involvement. But even though

the carriers have done an outstanding job of controlling their vehicles and drivers, there are still a large number of truck accidents each year that are caused by others. A study by American Fidelity and Casualty Co. of truck-involved accidents in the 1950's showed that in 104,000 accidents with other vehicles, truck drivers could not in any way have prevented 70% of them.

Over the years, the trucking industry has been in the forefront of highway user groups which have made a consistent and conscientious effort to reduce their contribution to highway accidents. That effort has involved the expenditure of large sums of money and a great deal of time and work. Now it is proposed that the cost of highway accidents be assigned, not to those responsible for them, but to all highway users, without regard to their driving habits, or their concern for their own welfare, or that of other users of the road. If there is to be a shift to a "no-fault" basis, we submit that if any segment of highway users should be singled out for favored treatment, it should be the motor carriers. But instead of being rewarded for their successful efforts to reduce highway accidents, S. 945 would subject them to discriminatory treatment. We don't ask for favors, but we do ask for fair treatment. If the law is to provide that, except for catastrophic loss, no driver involved in an accident is to be considered responsible for it, the same rule should apply with respect to drivers of commercial vehicles.

There is certainly no equity in arbitrarily assigning to such vehicles a very high percentage of the costs resulting from any accident in which it is involved. The proposal is indeed a paradox—on the one hand, operators of commercial vehicles are told that no matter how negligent automobile drivers may be, they bear no responsibility when they cause an accident in which the operator's trucks are involved, but the truck owners will be assessed a major share of the cost resulting from the very same accidents! Technically, this may be "no fault" insurance; practically, it is insurance which arbitrarily assigns a great majority of the blame (cost) to operators of commercial vehicles involved in accidents.

Under the current fault system of compensating for accident losses, motor carriers usually bear all or part of the accident costs if their drivers contributed in any degree to an accident. However, the system quite often protects the carrier when other drivers are totally responsible. Thus the present system provides incentive to the carriers to continue their programs of careful driver selection, training and supervision, and it keeps insurance costs at a point which the carriers can afford and still stay in business.

To the contrary, § 5(7) (A) and (B) of S. 945 would hold motor carriers uniformly liable for a large percentage of all property damage and personal injury regardless of whether or not their trucks were actually responsible for accidents. This would result in discrimination against trucks because, through millions of miles of operation, they are constantly exposed to accidents resulting from the driving errors of others.

The truck driver is a skilled professional who must meet strict physical requirements every two years and who is limited to a maximum of ten hours of driving in any one duty period. The vehicle he operates is a highly sophisticated machine that is the subject of regularly-scheduled inspections and preventive maintenance. Yet, on the highway, he is exposed to drivers who have varying degrees of ability and who quite often are pushing their stamina by attempting to cover 10, 15 and 20 hours of driving following an eight-hour work day. The truck driver is exposed to driving mistakes by the very young neophyte driver whose attitudes lack maturity, by the older driver who may lack the physical conditioning necessary to safe driving at high speeds, and, because a very substantial amount of over-the-road trucking occurs at night, to the drunken driver. As a result of this exposure, there is a strong likelihood that even the best and most defensive truck driver can become involved in an accident that he can in no way avoid. Under the provisions of these bills, the cost of such accidents would be largely borne by the motor carriers and their insurance costs would rise very substantially.

As an example of the inherent inequity of these bills which would hold the commercial vehicle largely or almost entirely responsible for an accident involving a passenger car, consider the cost results of an accident under the present system versus the system proposed by the bills:

A. Truck and trailer unit, westbound, in extreme right lane of 4-lane divided highway.

B. Passenger car with 4 occupants, eastbound, loses control, comes through the dividing median and collides with the truck.

Result: All occupants of car severely injured, No injury to truck driver.

PRESENT SYSTEM

Based on the premise that one who causes injury to another by negligent conduct should fairly and adequately compensate him for that injury, the truck operator would owe nothing.

S. 945

This bill requires payment of up to \$1,000 per month for a total of 30 months for loss of earnings resulting from an accident, with no specified limits on costs for medical, hospital, surgical, etc., services, and physical and occupational therapy and rehabilitation. Assuming that the injured parties in this accident were disabled many months each, the total cost for the injuries could well be in the hundreds of thousands of dollars, by virtue of the expenses covered by "economic" loss under § 2(10) of the bill.

Under the terms of S. 945 (§ 5(7)(A)) by which a larger vehicle, depending on its size, would be responsible for a substantial percentage of net economic loss, it is possible that the motor carrier would be required to pay upwards of 90% of the loss incurred by the occupants of the passenger car. While we assume the figure would be somewhat lower, the bill gives the Secretary of Transportation (§ 5(7)(B)) complete discretion to assign to vehicles larger than an "ordinary passenger automobile" a percentage of responsibility for net economic loss sustained by occupants of other vehicles. And the bill clearly indicates, in the same section, that the Secretary could determine that such responsibility would exceed 70%. The definition of "ordinary passenger automobile" contained in the bill (§ 5(7)(A)(i)) includes vehicles having a seating capacity of up to nine passengers. It is, therefore, clear that the cited example of costs which might be incurred by motor carriers because their vehicles are involved in accidents for which—under the present system—they could not be held responsible, is modest indeed.

S. 945 is contrary to the principle of "no-fault" insurance because it would penalize motor carriers by placing them under a "fault" system of insurance rather than a "no-fault" system. It would hold the carriers responsible for losses incurred by all parties to all accidents involving trucks as if the carriers' vehicles are always responsible for such accidents.

One of the claims made for "no-fault" insurance is that premium costs will be reduced, but S. 945, if enacted, would tremendously increase the costs of truck insurance because of the larger portion of accident costs that would be borne by insurance companies which supply truck insurance.

Under the retrospective rating plan, those costs will be shifted back to the motor carriers through an increase in premiums. The regulated for-hire trucking industry includes approximately 1,500 Class I carriers, 2,000 Class II carriers, and, in addition, 11,700 Class III carriers (those who annual gross revenues are less than \$300,000 and whose fleets consist of a small number of vehicles). All for-hire carriers operate on a very slim profit margin and many would be unable to absorb a sharp rise in insurance costs. The industry is faced with severe competition from railroads, airlines, freight forwarders, and to some extent, water carriers. Because of the competition of other transport modes—for-hire carriers are by no means completely free to recoup increased expenses by increases in their rates.

I referred earlier to H.R. 7514, introduced in the House by Congressman Moss of California. As we read his bill, it would eliminate the provision of S. 945 which would require that large vehicles be charged with a very substantial portion of the costs of all accidents in which they are involved, which is the very antithesis of the "no fault" principle. Let me say that we earnestly hope—if federal "no fault" insurance legislation is enacted—it will follow the lines of H.R. 7514 in this respect.

There is another aspect of S. 945 which seems entirely out of keeping with the "no-fault" philosophy. I refer to § 5(5), providing that persons not occupants of motor vehicles may recover their net economic loss from the insurer of any motor vehicle involved in an accident. First off, we think the approach suggested by Secretary Volpe in his appearance before this Committee on March 18, 1971, is preferable. As we understand his proposal, the insurance coverage obtained by a motor vehicle owner would cover himself and all members of his family whenever they were involved in a motor vehicle accident, whether in the owner's vehicle, as occupants of another vehicle, or as pedestrians. This would leave the owner's insurance company additionally liable only for injury or death to uninsured passengers or pedestrians.

But this is not our main objection to § 5(5). We believe its language is so broad as to allow recovery by any member of a train crew, or passenger on a train, from the insurer of any motor vehicle involved in a grade-crossing accident. Just as S. 945 requires owners of passenger cars and operators of trucks and buses to provide insurance to cover the net economic loss suffered by occupants of their vehicles, it should also require the railroads to assume the same obligation with respect to members of train crews and passengers on trains. This is no minor matter. Statistics published by the Department of Transportation show the following respecting grade-crossing accidents, and fatalities and injuries resulting therefrom, for the years 1967-1969:¹

| Year | Number of accidents | Fatalities | Injuries |
|-----------|---------------------|------------|----------|
| 1967..... | 3,932 | 1,632 | 3,812 |
| 1968..... | 3,816 | 1,536 | 3,744 |
| 1969..... | 3,774 | 1,490 | 3,669 |

If "no fault" is to be the standard for recovery of net economic loss in accidents involving motor vehicles, railroads cannot in fairness be given a free ride at the expense of owners of passenger cars, trucks and buses. Under S. 945 as presently worded, the Secretary of Transportation might well decide, in exercising his authority under § 5(7) (A), to assign 75% of the net economic loss incurred by a passenger car driver in an accident with a truck or bus to the insurer of the latter vehicles. If the bill is enacted with this provision included, then, by the same token, it should vest the same authority in the Secretary to assign responsibility—on a similar basis—to railroad equipment involved in accidents with passenger cars, trucks and buses.

Senator Moss. This concludes our witnesses for today.

This concludes our witnesses for today.

This committee will convene tomorrow at 10:15 here in this room to hear additional witnesses.

We are now in recess until tomorrow.

(Whereupon, at 3:20 p.m., the hearing was recessed, to reconvene at 1:15 a.m., Friday, May 14, 1971.)

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

FRIDAY, MAY 14, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to recess, at 10:30 a.m. in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart and Stevens.

Senator HART. The committee will be in order.

Senator Case of New Jersey had planned to join us this morning in order to introduce our first witness. He has sent word that the Foreign Relations Committee is discussing, as it always does, some world-shaking problem and has not yet resolved it; and he suggested that we go ahead.

So, I welcome for Senator Case and those of us on the committee here Mr. Eugene M. Haring of Newark, N.J. I should explain that I read through Mr. Haring's statement, and it sounded great.

We do welcome you.

May I ask that the summary biography of Mr. Haring be printed at this point in the record. It is a most impressive one. It lends additional weight to his testimony.

(The biography follows:)

BIOGRAPHICAL SKETCH OF EUGENE M. HARING

Princeton University; A.B., Summa Cum Laude, 1949 (Phi Beta Kappa).

Princeton University; A.M., Philosophy, 1951, (Woodrow Wilson Fellow 1949-50).

Harvard Law School; J.D., 1955.

McCarter & English, Newark, New Jersey; Associate, 1955-1961; Partner, 1961-

American Judicature Society; Essex County (N.J.) Bar Association; New Jersey State Bar Association; American Bar Association; Harvard Law School Association of New Jersey (Vice President & Trustee); Summit (New Jersey) Civil Rights Commission, 1970-71; United States Navy, 1945-46.

STATEMENT OF EUGENE M. HARING, ATTORNEY, McCARTER & ENGLISH, NEWARK, N.J., AND MEMBER, NEW JERSEY LAWYERS COMMITTEE FOR NO-FAULT INSURANCE; ACCOMPANIED BY JOHN L. MCGOLDRICK, ASSOCIATE

Mr. HARING. Thank you, Senator Hart.

On my left is John McGoldrick, my associate.

As I believe you know, I am a practicing lawyer with offices in Newark, N.J., although my practice extends throughout that State.

During a substantial part of my professional experience, I have been responsible for much of the litigation conducted by my firm, which is one of the largest in New Jersey. I have been responsible for a wide variety of litigation, including automobile negligence cases, life insurance, health insurance, disability insurance, and products liability cases. Because of my personal concern I am affiliated with a group of New Jersey lawyers from all parts of the State for the lawyers committee for no-fault insurance. This is an unfunded, voluntary group; it speaks solely for its members and, we believe, the public interest.

Cochairmen of this group are Charles Danzig, Woodruff J. English and Donald B. Kipp, all distinguished lawyers of broad experience in positions sensitive to the overall legal process in New Jersey.

In addition, among the sponsors of this group are Alfred C. Clapp, former Republican State senator and former presiding judge of the appellate division of New Jersey; and Bernard Shanley, New Jersey Republican national committeeman and former counsel to President Eisenhower.

This is not a political group. It is nonpartisan. It is comprised of both Republicans and Democrats.

The cochairmen of the New Jersey lawyers for no-fault insurance have approved a statement of position. It includes the following:

The Committee believes that the present system of handling automobile negligence litigation has demonstrated itself to be deficient in logic, in law and in practice.

The Committee urges that a new system—a no-fault system—be tried. The weaknesses of the existing system have been so abundantly demonstrated that it is clear that palliatives and patchwork will not alleviate, but can only aggravate, the serious problems which undeniably exist. Basic and extensive reform is required.

The Committee speaks only for itself. The lawyers comprising the Committee do not purport to speak for the clients of any of the Committee members nor for any other organized group.

It would be unfortunate indeed if the public were misled by a vocal segment of the Bar to believe that all lawyers are insensitive to the urgent need for reform.

That is the end of the excerpt from the committee's statement.

Chief Justice Weintraub of the New Jersey Supreme Court is respected nationally as well as in his own State. Under the New Jersey constitution the chief justice of New Jersey is directly responsible for the administration of the courts and must be in close touch with the judicial process in all the courts of the State. Chief Justice Weintraub of the New Jersey Supreme Court has stated publicly that he favors some form of no-fault insurance.

The chief justice has pointed out that given today's traffic congestion, accidents are inevitable. Indeed, they are statistically predictable. Given the split second accident, resulting from inadvertence, the chief justice has said we cannot speak realistically of fault.

Chief Justice Weintraub has said that accordingly there is not a fair basis upon which to fix fault, that if he thought the fault system were just, he would not advocate no-fault. He has pointed out that accidents happen so quickly that witnesses simply cannot recall and reconstruct the facts.

The chief justice says that saving court time by a no-fault system is a mere incidental benefit, that he would not advocate no-fault merely to save court time, but that given the split second quality of accidents,

their inevitability and predictability, a no-fault plan is the just and equitable plan. His basis for advocating no-fault is fairness and justice.

Quite apart from the position of the lawyers' committee I would make a few personal comments from my experience as a New Jersey trial lawyer.

I should say, Senator, that I am not here representing any vested interest. I am not here for labor. I am not here for business. I am not here for the insurance industry. I am here on my own. I bought my own ticket on the railroad.

New Jersey is the most densely populated States in the Nation. The density of automobiles in New Jersey is the greatest in the Nation. Accordingly, the problems which arise from the present automobile liability system are particularly severe in that State.

What we do under the tort system as distinct from what some lawyers say we do is attempt to provide compensation—compensation for the injured—but within a fault framework.

Indeed, the principle of compensation becomes most evident in the usual settlement conference which precedes a jury trial, and by which process the vast majority of cases are disposed of. At least by the morning of trial it becomes plainly evident that fault is not some absolute moral principle. Fault is what a jury says.

Given a split second accident which occurred years ago, jury verdicts are predicably unpredictable. Hence the settlement conference, the trade of certainty for risk.

Under the present system drivers play roulette. If they have an accident, no matter how seriously injured they are, they may well get very little. They stand a slim chance of hitting the jackpot. The recovery depends on how much insurance a stranger buys.

In fact, we are operating under an internally inconsistent system. We are trying to move in two directions at once. On the one hand, we operate within a system designed to prove fault and to reward the innocent. On the other hand, we apply principles of compensation with little regard to fault.

The result is uncertain compensation and frequently inadequate compensation, provided by a highly expensive system which was designed to determine fault.

Basic protection, self-insurance, or, as it has come to be called no-fault insurance would do what insurance was originally supposed to do—spread the risk and provide a certainty of payment.

You are well aware that highly vocal, and, at times shrill, objection to no-fault insurance has come from members of the legal profession. The familiar system seems simpler and more comfortable. Undoubtedly, much objection, while entirely sincere, proceeds from sheer inertia and visceral opposition to change. You know from recent testimony that some of it proceeds from sheer self-interest.

But, the legal profession, after all, exists to serve the public and not the other way around.

My office is in Newark. That city and much of New Jersey is beset by those social and economic and racial problems which afflict urban areas throughout the Nation.

Problems with respect to environment, products liability, consumers' rights, and the accommodation of conflicting interests of economic and racial groups more and more require and demand the attention of our courts both on the civil and criminal side.

In New Jersey 83 percent of automobile liability cases are settled before verdict. Accordingly, our courts are used largely not for the trial of cases at all, for which they were designed. They are a marketplace for the arbitration and compromise of claims.

Frequently the talents called upon are not so much those of the trained lawyer or judge, but those to be found in a Turkish bazaar. The time of lawyers and of judges is used to decide somehow the trading value of a whiplash injury, a broken arm or the loss of a leg. Their time could be used more productively.

I submit that the legal profession in the United States is one of the most valuable assets this country has. Its energies and talent should be directed to the most important problems which we face. A system which diverts so much legal talent to automobile liability settlements and trials wastes a valuable national resource.

There are numerous no-fault plans. The bill before this committee, S. 945, combines good aspects of many of these plans. It would provide reasonable medical expenses, would reimburse the injured for necessary services and, very important, would provide all reasonable expenses for rehabilitation.

At the same time, it limits reimbursement for wage loss to \$30,000. It does not eliminate recovery for catastrophic harm.

Thus, limits are set upon the coverage while the victim of catastrophe may bring a legal action to receive a prompt decision in a court uncluttered by thousands of small automobile liability cases.

Criticisms frequently heard of the State bills relate to the out-of-State accident and the out-of-State driver. While this problem is not insuperable on a State level, it would be eliminated by the proposed Federal bill.

Senator HART. I hate to interrupt, and yet I must welcome the distinguished Senator whom we talked about a few moments ago. I hate to interrupt because the testimony is powerful and I hope will be listened to widely.

Senator CASE. Mr. Chairman, you are most gracious.

I am always happy when I can introduce two people whom I like very much to each other. In this respect, this is no exception.

Mr. Haring is a partner of an old and distinguished firm.

I am enormously happy that I could come in before he finished. I am sorry I was not here when he started. But if you will permit me non pro tunc to present to you one of our distinguished lawyers representing the bar committee on no-fault insurance, I would like to have it entered in the record that I do so. When you and I have long since ceased to be here and come back and look at the record you will not remember that I came in after he started.

Senator HART. We will fix that record.

Mr. HARING. Senator Hart, we need a self-insurance system. We need a no-fault system. We need prompt and well-considered reform. I personally believe that this bill will provide it.

I should say, Senator, my longer statement I hope will be filed and be made a matter of record. I have read a summary of my longer statement, and I am open to any questions.

Senator HART. Mr. Haring, the statement will be printed in full.

I indicated, having had an opportunity to read much of the statement in advance, that it is a powerful plea for the kind of reform that

we are considering here. There is so much in it, brief though it is, that simply puts exclamation points behind so much of what we have heard.

I sense those of us who feel strongly the need for legislation will be excerpting without credit from it in the days and weeks ahead. That expression "drivers play roulette," for example, is really so true under our existing system; whether you are going to be hit by a drunken driver who is heavily insured or a careful driver who may for a moment have been guilty of some omission whose fault is questionable but who isn't insured is a matter of chance.

What I think I would refer to most frequently is the point you make in reply to the argument that a no-fault system rewards irresponsibility and somehow or another has socially unacceptable implications.

In your statement you address yourself to that. You label it an invalid doctrine and conclude by saying, "A no-fault system promotes family integrity, rehabilitation and the self-respect which comes with it." I hope that point will be more clearly understood by all of us as we plow this ground.

It is not easy, I am sure even from so distinguished a firm as yours, to voice opinions that in the sense are regarded by your fellow members at the bar as doing them a direct financial disservice. But you are not alone because the profession happily is coming forward to speak the need for this reform as they see it. But to have one of your standing—and those associated with you in the New Jersey lawyer's committee for no-fault insurance—such as your able chief justice, Chief Justice Weintraub—come forward inevitably will help us make progress. The cumulative effect of this I hope will be great.

Last week this committee heard from a younger lawyer, Robert Joost of Boston who had been associated with the Trial Lawyers Association for some years. Incidentally, his academic credentials I thought would be unmatched, but yours match them, I notice.

Mr. HARING. Thank you.

Senator HART. If there is no objection, I would like to insert in the record a letter that I received from a partner in a prominent Milwaukee firm endorsing the concept of no-fault at the Federal level. He said:

To await action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal jurisdictions.

He concludes by saying:

I am well aware of the objections of lawyers to no-fault insurance. I can't help but feel that much of this complaint is based on the prospective loss of fees. This really is not a valid cause for objection.

This letter along with another from a lawyer who has been an insurance instructor in San Francisco and an orthopedic surgeon will be made a part of the record.

(The letters follow:)

MICHAEL, BEST & FRIEDRICH.
Milwaukee, Wis., April 6, 1971.

SENATOR PHILIP HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: This is to endorse the concept of no-fault insurance on a Federal level. To wait action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal juris-

I understand the objection that you have to the bill S. 945. The others you didn't comment on and didn't have any matter to present.

In this discussion that you had on the training of drivers, and therefore incentive to forestall accidents, to drive safely, don't insurance costs vary among companies depending on the record that they make of accidents?

Mr. BEARDSLEY. They surely do. Because of the retrospective system that I mentioned, Senator, if a company has a bad record, it is reflected next year in its premium.

Senator Moss. So that sort of incentive would remain even if commercial trucks were required to continue to buy insurance; there would still be a great incentive to train drivers for safe driving, wouldn't there?

Mr. BEARDSLEY. I would hope there always would be regardless of what the state of the law was insurancewise or otherwise. That is the way it ought to be.

Senator Moss. I would hope so, too, and I would expect there would be, but I was just pointing out that some economic incentive would remain there for the companies to do that. But other than the concern that you have that trucks are treated differently from passenger cars, you don't find any great difficulty with the bill. Is that right?

Mr. BEARDSLEY. No, sir. As I said at the outset of my testimony, this is something fairly new for ATA to be getting into. I recall this is the first time we had occasion to testify with respect to any legislation dealing with insurance, certainly in the Congress. And we are sort of feeling our way along, if I may say so.

We have a meeting of our executive committee coming up after the middle of June and we are going to put this subject on the agenda for further consideration. I have no way of knowing what the results will be, it may be just where we stand today, we may get some instructions to take a broader approach, so to speak. But so far our only instructions are to oppose S. 945 because of the provisions I stressed in my testimony.

Senator Moss. Well, we surely appreciate your coming and we hope that when you have further considered it, if you arrive at a policy decision, you will communicate it to the committee and we will probably still be deeply involved in this, and when our transcript of our hearings is printed up, and you study them, if you have additional comments you think you would like to submit based on that, we would appreciate having that from you, too.

Mr. BEARDSLEY. Thank you very much.

Senator Moss. Thank you, Mr. Beardsley.

We appreciate your appearance here today.

(The statement follows:)

STATEMENT OF PETER T. BEARDSLEY, VICE PRESIDENT AND GENERAL COUNSEL,
AMERICAN TRUCKING ASSOCIATIONS, INC.

Mr. Chairman and Members of the Subcommittee:

My name is Peter T. Beardsley, and I am a Vice-President, and the General Counsel of American Trucking Associations, Inc. Our organization is the national trade association of the motor carrier industry. It represents all types of motor carriers, and has affiliated associations in every state and the District of Columbia. Its office is located at 1616 P Street, N.W., Washington, D.C. 20036.

As a part of our activities, we often take a position before Congress respecting proposals which, if enacted, would have a significant impact upon the truck-

ing industry. Ordinarily, such proposals are the same as, or very similar to, others which have preceded them, or propose amendments to existing laws with which we are familiar. We confess to a lack of familiarity, however, with "no-fault" insurance, if for no other reason than that the subject itself—at least in the form of proposed legislation—is relatively new. We assume that "no-fault" means essentially that regardless of the degree of negligence exhibited by the various drivers involved in an accident, each of them would be paid by his insurer for his "net economic loss" as that term is defined in S. 945. Based on that assumption, we take no position at this time respecting the "no-fault" principle as such.

We believe that in view of the very substantial change which this bill proposes in the field of motor-vehicle accident insurance, it would be wise before seriously considering its enactment to await the results of experience under State "no-fault" laws such as that which recently became effective in Massachusetts, and those of other States which may be enacted.

In any event, S. 945 is not, in any practical sense, "no-fault" insofar as the trucking industry is concerned, and we have no alternative but to oppose it for that reason. If the bill were amended along the lines of H.R. 7514, introduced by Chairman Moss of the Subcommittee on Commerce and Finance of the House Committee on Interstate and Foreign Commerce, we would find it much less objectionable.

We take no position on S. 946 or S. 947, or the resolution proposed by Secretary Volpe in his testimony before this Committee on March 18, 1971.

The interstate motor carriers subject to economic regulation by the Interstate Commerce Commission, and safety regulation by the Department of Transportation, fall into several categories. Over 15,000 for-hire carriers (common and contract) are subject to both economic and safety regulation. There are additional thousands of for-hire carriers (mostly transporters of agricultural commodities) which are subject to safety regulation by DOT but exempt from ICC economic regulation. It is on behalf of the "regulated" carriers, rather than the "exempt" carriers that this statement is filed. ATA also represents the interests of numerous private carriers of property through their membership in one or more of the ATA-affiliated State trucking associations, and this statement is filed on their behalf too.

The trucking industry's concern for highway safety originated in a natural, humanitarian desire to reduce the tragedy of death and injury in traffic, and in a determination to improve the reputation of the industry as a safe, courteous partner on the road.

In addition, there is a business incentive for maintaining an extensive safety program. The millions of trucks of all kinds in daily use on streets and highways are constantly exposed to accident-producing situations which can result in loss or damage to other highway users, to industry drivers and vehicles, and to customer freight. Such accidents have the potential of putting any motor carrier out of business because of the extremely high costs that are incurred through civil suits, workmen's compensation, vehicle repairs and freight claims. Those costs are direct expenses to the carrier, regardless of the amount of its insurance coverage, as truck insurance is written on a retrospective basis so that the premium for a given year is raised or lowered to reflect the accident cost experience for the previous year.

The loss potential faced by truck fleets and the retrospective method of rating insurance have been incentives for the conduct of carefully planned programs to prevent accidents.

Industry experience shows that driver selection is the key to the entire safety program, and so trucking companies try to insure that they do not "hire their problems." In employment interviews and reference checks of prospective drivers, personnel officials use nationally approved guidelines which prescribe rigorous qualifications. Past employment, credit background, and traffic record are among the factors explored to determine an applicant's reliability, attitude and willingness to accept responsibility for his vehicle and cargo, and for the welfare of other highway users.

The industry's driver selection program had its beginning in the 1920's and was adopted as a national standard in 1940. In the 1960's it was further improved through an industry-sponsored study by the School of Public Health of Harvard University which was designed to provide more information about driver motivation.

After being hired, a driver trainee receives detailed classroom instruction in company policies, traffic regulations, safety requirements, knowledge of the vehicle and techniques for safe driving. To develop driving proficiency he undergoes a lengthy probationary period starting with student trips in the company of an experienced driver. He learns how to handle smaller trucks at first, and eventually may drive an intercity tractor-trailer rig.

Throughout his employment, industry and fleet supervision is provided through road patrols, radar checks, safety meetings and conferences, and the use of recording devices and check stations.

The professional truck driver is required to follow the code of "defensive driving," which places responsibility upon him to drive in such a way that he commits no driving errors himself and can protect himself against the mistakes of other drivers. If he is involved in an accident his company rules the accident as "preventable" or "non-preventable." A preventable accident is one in which the truck driver did not take every possible step to prevent the accident, regardless of whether or not he was legally in the right and the other driver was legally wrong. Under this concept of preventability the driver's attitudes and actions are brought under close scrutiny and control by the company so that the driver who develops poor attitudes or poor driving habits is quickly retrained or released from employment.

The effectiveness of the industry's programs is reflected in the following National Safety Council accident figures:

| Year | Percent of trucks involved in accidents | Truck percent of registered vehicles | Percent of cars involved in accidents | Car percent of registered vehicles |
|-----------|---|--------------------------------------|---------------------------------------|------------------------------------|
| 1948..... | 17.0 | 18.0 | 80.0 | 81.0 |
| 1969..... | 11.5 | 16.6 | 85.1 | 80.8 |

These figures are taken from the National Safety Council's publication, "Accident Facts," 1949 and 1970 editions, pp. 66 and 56, respectively. They demonstrate that the truck record for accident involvement has improved substantially over the period shown, whereas that of the passenger car has gotten worse. The figures shown do not reflect mileage driven. When this factor is considered, the truck record is significantly better than that of the passenger cars. This is demonstrated by the following figures:

| | | |
|-------------------------|---|-----------------|
| Intercity fleets..... | Total truck mileage..... | 12,460,796,451 |
| (Class I and II)..... | Total trucks involved in accidents..... | 39,362 |
| | Ratio of trucks involved per million miles..... | 3.15 |
| All trucks..... | Total truck mileage..... | 206,630,000,000 |
| | Total trucks involved in accidents..... | 3,075,000 |
| | Ratio of trucks involved per million miles..... | 14.9 |
| All passenger cars..... | Total passenger car mileage..... | 849,633,000,000 |
| | Total cars involved in accidents..... | 22,800,000 |
| | Ratio of passenger cars involved per million miles..... | 26.8 |

The Class I and II trucks referred to in the first category are those for-hire vehicles subject to economic regulation by the Interstate Commerce Commission, and safety regulation by the Department of Transportation. The mileage and accident figures are obtained from the pamphlet, "1969 Accidents of Large Motor Carriers of Property," Bureau of Motor Vehicle Safety, Department of Transportation. A Class I carrier is one whose annual gross operating revenue is \$1 million or more. A Class II carrier is one whose annual gross operating revenue is \$300,000, but less than \$1 million. The second category "all trucks," covers just that. It includes, for example, farm trucks, trucks operated by the federal government, as well as a very large number of trucks not subject to economic regulation by the ICC, but subject to DOT safety regulation. The mileage figures for both the second and third categories are those of the Department of Transportation (Highway Statistics, 1969, Table VM-1, p. 73), and the accident figures are those of the National Safety Council (Accident Facts, 1970 ed., p. 56). 1969 figures are used, as they are the latest available from all sources.

The effect of the industry's safety programs has been to enable motor carriers to significantly reduce the heavy costs of accident involvement. But even though

the carriers have done an outstanding job of controlling their vehicles and drivers, there are still a large number of truck accidents each year that are caused by others. A study by American Fidelity and Casualty Co. of truck-involved accidents in the 1950's showed that in 104,000 accidents with other vehicles, truck drivers could not in any way have prevented 70% of them.

Over the years, the trucking industry has been in the forefront of highway user groups which have made a consistent and conscientious effort to reduce their contribution to highway accidents. That effort has involved the expenditure of large sums of money and a great deal of time and work. Now it is proposed that the cost of highway accidents be assigned, not to those responsible for them, but to all highway users, without regard to their driving habits, or their concern for their own welfare, or that of other users of the road. If there is to be a shift to a "no-fault" basis, we submit that if any segment of highway users should be singled out for favored treatment, it should be the motor carriers. But instead of being rewarded for their successful efforts to reduce highway accidents, S. 945 would subject them to discriminatory treatment. We don't ask for favors, but we do ask for fair treatment. If the law is to provide that, except for catastrophic loss, no driver involved in an accident is to be considered responsible for it, the same rule should apply with respect to drivers of commercial vehicles.

There is certainly no equity in arbitrarily assigning to such vehicles a very high percentage of the costs resulting from any accident in which it is involved. The proposal is indeed a paradox—on the one hand, operators of commercial vehicles are told that no matter how negligent automobile drivers may be, they bear no responsibility when they cause an accident in which the operator's trucks are involved, but the truck owners will be assessed a major share of the cost resulting from the very same accidents! Technically, this may be "no fault" insurance; practically, it is insurance which arbitrarily assigns a great majority of the blame (cost) to operators of commercial vehicles involved in accidents.

Under the current fault system of compensating for accident losses, motor carriers usually bear all or part of the accident costs if their drivers contributed in any degree to an accident. However, the system quite often protects the carrier when other drivers are totally responsible. Thus the present system provides incentive to the carriers to continue their programs of careful driver selection, training and supervision, and it keeps insurance costs at a point which the carriers can afford and still stay in business.

To the contrary, § 5(7) (A) and (B) of S. 945 would hold motor carriers uniformly liable for a large percentage of all property damage and personal injury regardless of whether or not their trucks were actually responsible for accidents. This would result in discrimination against trucks because, through millions of miles of operation, they are constantly exposed to accidents resulting from the driving errors of others.

The truck driver is a skilled professional who must meet strict physical requirements every two years and who is limited to a maximum of ten hours of driving in any one duty period. The vehicle he operates is a highly sophisticated machine that is the subject of regularly-scheduled inspections and preventive maintenance. Yet, on the highway, he is exposed to drivers who have varying degrees of ability and who quite often are pushing their stamina by attempting to cover 10, 15 and 20 hours of driving following an eight-hour work day. The truck driver is exposed to driving mistakes by the very young neophyte driver whose attitudes lack maturity, by the older driver who may lack the physical conditioning necessary to safe driving at high speeds, and, because a very substantial amount of over-the-road trucking occurs at night, to the drunken driver. As a result of this exposure, there is a strong likelihood that even the best and most defensive truck driver can become involved in an accident that he can in no way avoid. Under the provisions of these bills, the cost of such accidents would be largely borne by the motor carriers and their insurance costs would rise very substantially.

As an example of the inherent inequity of these bills which would hold the commercial vehicle largely or almost entirely responsible for an accident involving a passenger car, consider the cost results of an accident under the present system versus the system proposed by the bills:

A. Truck and trailer unit, westbound, in extreme right lane of 4-lane divided highway.

B. Passenger car with 4 occupants, eastbound, loses control, comes through the dividing median and collides with the truck.

Result: All occupants of car severely injured, No injury to truck driver.

PRESENT SYSTEM

Based on the premise that one who causes injury to another by negligent conduct should fairly and adequately compensate him for that injury, the truck operator would owe nothing.

S. 945

This bill requires payment of up to \$1,000 per month for a total of 30 months for loss of earnings resulting from an accident, with no specified limits on costs for medical, hospital, surgical, etc., services, and physical and occupational therapy and rehabilitation. Assuming that the injured parties in this accident were disabled many months each, the total cost for the injuries could well be in the hundreds of thousands of dollars, by virtue of the expenses covered by "economic" loss under § 2(10) of the bill.

Under the terms of S. 945 (§ 5(7)(A)) by which a larger vehicle, depending on its size, would be responsible for a substantial percentage of net economic loss, it is possible that the motor carrier would be required to pay upwards of 90% of the loss incurred by the occupants of the passenger car. While we assume the figure would be somewhat lower, the bill gives the Secretary of Transportation (§ 5(7)(B)) complete discretion to assign to vehicles larger than an "ordinary passenger automobile" a percentage of responsibility for net economic loss sustained by occupants of other vehicles. And the bill clearly indicates, in the same section, that the Secretary could determine that such responsibility would exceed 70%. The definition of "ordinary passenger automobile" contained in the bill (§ 5(7)(A)(1)) includes vehicles having a seating capacity of up to nine passengers. It is, therefore, clear that the cited example of costs which might be incurred by motor carriers because their vehicles are involved in accidents for which—under the present system—they could not be held responsible, is modest indeed.

S. 945 is contrary to the principle of "no-fault" insurance because it would penalize motor carriers by placing them under a "fault" system of insurance rather than a "no-fault" system. It would hold the carriers responsible for losses incurred by all parties to all accidents involving trucks as if the carriers' vehicles are always responsible for such accidents.

One of the claims made for "no-fault" insurance is that premium costs will be reduced, but S. 945, if enacted, would tremendously increase the costs of truck insurance because of the larger portion of accident costs that would be borne by insurance companies which supply truck insurance.

Under the retrospective rating plan, those costs will be shifted back to the motor carriers through an increase in premiums. The regulated for-hire trucking industry includes approximately 1,500 Class I carriers, 2,000 Class II carriers, and, in addition, 11,700 Class III carriers (those who annual gross revenues are less than \$300,000 and whose fleets consist of a small number of vehicles). All for-hire carriers operate on a very slim profit margin and many would be unable to absorb a sharp rise in insurance costs. The industry is faced with severe competition from railroads, airlines, freight forwarders, and to some extent, water carriers. Because of the competition of other transport modes—for-hire carriers are by no means completely free to recoup increased expenses by increases in their rates.

I referred earlier to H.R. 7514, introduced in the House by Congressman Moss of California. As we read his bill, it would eliminate the provision of S. 945 which would require that large vehicles be charged with a very substantial portion of the costs of all accidents in which they are involved, which is the very antithesis of the "no fault" principle. Let me say that we earnestly hope—if federal "no fault" insurance legislation is enacted—it will follow the lines of H.R. 7514 in this respect.

There is another aspect of S. 945 which seems entirely out of keeping with the "no-fault" philosophy. I refer to § 5(5), providing that persons not occupants of motor vehicles may recover their net economic loss from the insurer of any motor vehicle involved in an accident. First off, we think the approach suggested by Secretary Volpe in his appearance before this Committee on March 18, 1971, is preferable. As we understand his proposal, the insurance coverage obtained by a motor vehicle owner would cover himself and all members of his family whenever they were involved in a motor vehicle accident, whether in the owner's vehicle, as occupants of another vehicle, or as pedestrians. This would leave the owner's insurance company additionally liable only for injury or death to uninsured passengers or pedestrians.

But this is not our main objection to § 5(5). We believe its language is so broad as to allow recovery by any member of a train crew, or passenger on a train, from the insurer of any motor vehicle involved in a grade-crossing accident. Just as S. 945 requires owners of passenger cars and operators of trucks and buses to provide insurance to cover the net economic loss suffered by occupants of their vehicles, it should also require the railroads to assume the same obligation with respect to members of train crews and passengers on trains. This is no minor matter. Statistics published by the Department of Transportation show the following respecting grade-crossing accidents, and fatalities and injuries resulting therefrom, for the years 1967-1969:¹

| Year | Number of accidents | Fatalities | Injuries |
|-----------|---------------------|------------|----------|
| 1967..... | 3,932 | 1,632 | 3,812 |
| 1968..... | 3,816 | 1,536 | 3,744 |
| 1969..... | 3,774 | 1,490 | 3,669 |

If "no fault" is to be the standard for recovery of net economic loss in accidents involving motor vehicles, railroads cannot in fairness be given a free ride at the expense of owners of passenger cars, trucks and buses. Under S. 945 as presently worded, the Secretary of Transportation might well decide, in exercising his authority under § 5(7) (A), to assign 75% of the net economic loss incurred by a passenger car driver in an accident with a truck or bus to the insurer of the latter vehicles. If the bill is enacted with this provision included, then, by the same token, it should vest the same authority in the Secretary to assign responsibility—on a similar basis—to railroad equipment involved in accidents with passenger cars, trucks and buses.

Senator Moss. This concludes our witnesses for today.

This concludes our witnesses for today.

This committee will convene tomorrow at 10:15 here in this room to hear additional witnesses.

We are now in recess until tomorrow.

(Whereupon, at 3:20 p.m., the hearing was recessed, to reconvene at 1:15 a.m., Friday, May 14, 1971.)

¹ Accident Bulletin No. 138, Federal Railroad Administration, Table 6, p. 2.

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

FRIDAY, MAY 14, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to recess, at 10:30 a.m. in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart and Stevens.

Senator HART. The committee will be in order.

Senator Case of New Jersey had planned to join us this morning in order to introduce our first witness. He has sent word that the Foreign Relations Committee is discussing, as it always does, some world-shaking problem and has not yet resolved it; and he suggested that we go ahead.

So, I welcome for Senator Case and those of us on the committee here Mr. Eugene M. Haring of Newark, N.J. I should explain that I read through Mr. Haring's statement, and it sounded great.

We do welcome you.

May I ask that the summary biography of Mr. Haring be printed at this point in the record. It is a most impressive one. It lends additional weight to his testimony.

(The biography follows:)

BIOGRAPHICAL SKETCH OF EUGENE M. HARING

Princeton University; A.B., Summa Cum Laude, 1949 (Phi Beta Kappa).

Princeton University; A.M., Philosophy, 1951, (Woodrow Wilson Fellow 1949-50).

Harvard Law School; J.D., 1955.

McCarter & English, Newark, New Jersey; Associate, 1955-1961; Partner, 1961-

American Judicature Society; Essex County (N.J.) Bar Association; New Jersey State Bar Association; American Bar Association; Harvard Law School Association of New Jersey (Vice President & Trustee); Summit (New Jersey) Civil Rights Commission, 1970-71; United States Navy, 1945-46.

STATEMENT OF EUGENE M. HARING, ATTORNEY, McCARTER & ENGLISH, NEWARK, N.J., AND MEMBER, NEW JERSEY LAWYERS COMMITTEE FOR NO-FAULT INSURANCE; ACCOMPANIED BY JOHN L. MCGOLDRICK, ASSOCIATE

Mr. HARING. Thank you, Senator Hart.

On my left is John McGoldrick, my associate.

As I believe you know, I am a practicing lawyer with offices in Newark, N.J., although my practice extends throughout that State.

During a substantial part of my professional experience, I have been responsible for much of the litigation conducted by my firm, which is one of the largest in New Jersey. I have been responsible for a wide variety of litigation, including automobile negligence cases, life insurance, health insurance, disability insurance, and products liability cases. Because of my personal concern I am affiliated with a group of New Jersey lawyers from all parts of the State for the lawyers committee for no-fault insurance. This is an unfunded, voluntary group; it speaks solely for its members and, we believe, the public interest.

Cochairmen of this group are Charles Danzig, Woodruff J. English and Donald B. Kipp, all distinguished lawyers of broad experience in positions sensitive to the overall legal process in New Jersey.

In addition, among the sponsors of this group are Alfred C. Clapp, former Republican State senator and former presiding judge of the appellate division of New Jersey; and Bernard Shanley, New Jersey Republican national committeeman and former counsel to President Eisenhower.

This is not a political group. It is nonpartisan. It is comprised of both Republicans and Democrats.

The cochairmen of the New Jersey lawyers for no-fault insurance have approved a statement of position. It includes the following:

The Committee believes that the present system of handling automobile negligence litigation has demonstrated itself to be deficient in logic, in law and in practice.

The Committee urges that a new system—a no-fault system—be tried. The weaknesses of the existing system have been so abundantly demonstrated that it is clear that palliatives and patchwork will not alleviate, but can only aggravate, the serious problems which undeniably exist. Basic and extensive reform is required.

The Committee speaks only for itself. The lawyers comprising the Committee do not purport to speak for the clients of any of the Committee members nor for any other organized group.

It would be unfortunate indeed if the public were misled by a vocal segment of the Bar to believe that all lawyers are insensitive to the urgent need for reform.

That is the end of the excerpt from the committee's statement.

Chief Justice Weintraub of the New Jersey Supreme Court is respected nationally as well as in his own State. Under the New Jersey constitution the chief justice of New Jersey is directly responsible for the administration of the courts and must be in close touch with the judicial process in all the courts of the State. Chief Justice Weintraub of the New Jersey Supreme Court has stated publicly that he favors some form of no-fault insurance.

The chief justice has pointed out that given today's traffic congestion, accidents are inevitable. Indeed, they are statistically predictable. Given the split second accident, resulting from inadvertence, the chief justice has said we cannot speak realistically of fault.

Chief Justice Weintraub has said that accordingly there is not a fair basis upon which to fix fault, that if he thought the fault system were just, he would not advocate no-fault. He has pointed out that accidents happen so quickly that witnesses simply cannot recall and reconstruct the facts.

The chief justice says that saving court time by a no-fault system is a mere incidental benefit, that he would not advocate no-fault merely to save court time, but that given the split second quality of accidents,

their inevitability and predictability, a no-fault plan is the just and equitable plan. His basis for advocating no-fault is fairness and justice.

Quite apart from the position of the lawyers' committee I would make a few personal comments from my experience as a New Jersey trial lawyer.

I should say, Senator, that I am not here representing any vested interest. I am not here for labor. I am not here for business. I am not here for the insurance industry. I am here on my own. I bought my own ticket on the railroad.

New Jersey is the most densely populated States in the Nation. The density of automobiles in New Jersey is the greatest in the Nation. Accordingly, the problems which arise from the present automobile liability system are particularly severe in that State.

What we do under the tort system as distinct from what some lawyers say we do is attempt to provide compensation—compensation for the injured—but within a fault framework.

Indeed, the principle of compensation becomes most evident in the usual settlement conference which precedes a jury trial, and by which process the vast majority of cases are disposed of. At least by the morning of trial it becomes plainly evident that fault is not some absolute moral principle. Fault is what a jury says.

Given a split second accident which occurred years ago, jury verdicts are predicably unpredictable. Hence the settlement conference, the trade of certainty for risk.

Under the present system drivers play roulette. If they have an accident, no matter how seriously injured they are, they may well get very little. They stand a slim chance of hitting the jackpot. The recovery depends on how much insurance a stranger buys.

In fact, we are operating under an internally inconsistent system. We are trying to move in two directions at once. On the one hand, we operate within a system designed to prove fault and to reward the innocent. On the other hand, we apply principles of compensation with little regard to fault.

The result is uncertain compensation and frequently inadequate compensation, provided by a highly expensive system which was designed to determine fault.

Basic protection, self-insurance, or, as it has come to be called no-fault insurance would do what insurance was originally supposed to do—spread the risk and provide a certainty of payment.

You are well aware that highly vocal, and, at times shrill, objection to no-fault insurance has come from members of the legal profession. The familiar system seems simpler and more comfortable. Undoubtedly, much objection, while entirely sincere, proceeds from sheer inertia and visceral opposition to change. You know from recent testimony that some of it proceeds from sheer self-interest.

But, the legal profession, after all, exists to serve the public and not the other way around.

My office is in Newark. That city and much of New Jersey is beset by those social and economic and racial problems which afflict urban areas throughout the Nation.

Problems with respect to environment, products liability, consumers' rights, and the accommodation of conflicting interests of economic and racial groups more and more require and demand the attention of our courts both on the civil and criminal side.

In New Jersey 83 percent of automobile liability cases are settled before verdict. Accordingly, our courts are used largely not for the trial of cases at all, for which they were designed. They are a marketplace for the arbitration and compromise of claims.

Frequently the talents called upon are not so much those of the trained lawyer or judge, but those to be found in a Turkish bazaar. The time of lawyers and of judges is used to decide somehow the trading value of a whiplash injury, a broken arm or the loss of a leg. Their time could be used more productively.

I submit that the legal profession in the United States is one of the most valuable assets this country has. Its energies and talent should be directed to the most important problems which we face. A system which diverts so much legal talent to automobile liability settlements and trials wastes a valuable national resource.

There are numerous no-fault plans. The bill before this committee, S. 945, combines good aspects of many of these plans. It would provide reasonable medical expenses, would reimburse the injured for necessary services and, very important, would provide all reasonable expenses for rehabilitation.

At the same time, it limits reimbursement for wage loss to \$30,000. It does not eliminate recovery for catastrophic harm.

Thus, limits are set upon the coverage while the victim of catastrophe may bring a legal action to receive a prompt decision in a court uncluttered by thousands of small automobile liability cases.

Criticisms frequently heard of the State bills relate to the out-of-State accident and the out-of-State driver. While this problem is not insuperable on a State level, it would be eliminated by the proposed Federal bill.

Senator HART. I hate to interrupt, and yet I must welcome the distinguished Senator whom we talked about a few moments ago. I hate to interrupt because the testimony is powerful and I hope will be listened to widely.

Senator CASE. Mr. Chairman, you are most gracious.

I am always happy when I can introduce two people whom I like very much to each other. In this respect, this is no exception.

Mr. Haring is a partner of an old and distinguished firm.

I am enormously happy that I could come in before he finished. I am sorry I was not here when he started. But if you will permit me non pro tunc to present to you one of our distinguished lawyers representing the bar committee on no-fault insurance, I would like to have it entered in the record that I do so. When you and I have long since ceased to be here and come back and look at the record you will not remember that I came in after he started.

Senator HART. We will fix that record.

Mr. HARING. Senator Hart, we need a self-insurance system. We need a no-fault system. We need prompt and well-considered reform. I personally believe that this bill will provide it.

I should say, Senator, my longer statement I hope will be filed and be made a matter of record. I have read a summary of my longer statement, and I am open to any questions.

Senator HART. Mr. Haring, the statement will be printed in full,

I indicated, having had an opportunity to read much of the statement in advance, that it is a powerful plea for the kind of reform that

we are considering here. There is so much in it, brief though it is, that simply puts exclamation points behind so much of what we have heard.

I sense those of us who feel strongly the need for legislation will be excerpting without credit from it in the days and weeks ahead. That expression "drivers play roulette," for example, is really so true under our existing system; whether you are going to be hit by a drunken driver who is heavily insured or a careful driver who may for a moment have been guilty of some omission whose fault is questionable but who isn't insured is a matter of chance.

What I think I would refer to most frequently is the point you make in reply to the argument that a no-fault system rewards irresponsibility and somehow or another has socially unacceptable implications.

In your statement you address yourself to that. You label it an invalid doctrine and conclude by saying, "A no-fault system promotes family integrity, rehabilitation and the self-respect which comes with it." I hope that point will be more clearly understood by all of us as we plow this ground.

It is not easy, I am sure even from so distinguished a firm as yours, to voice opinions that in the sense are regarded by your fellow members at the bar as doing them a direct financial disservice. But you are not alone because the profession happily is coming forward to speak the need for this reform as they see it. But to have one of your standing—and those associated with you in the New Jersey lawyer's committee for no-fault insurance—such as your able chief justice, Chief Justice Weintraub—come forward inevitably will help us make progress. The cumulative effect of this I hope will be great.

Last week this committee heard from a younger lawyer, Robert Joost of Boston who had been associated with the Trial Lawyers Association for some years. Incidentally, his academic credentials I thought would be unmatched, but yours match them, I notice.

Mr. HARING. Thank you.

Senator HART. If there is no objection, I would like to insert in the record a letter that I received from a partner in a prominent Milwaukee firm endorsing the concept of no-fault at the Federal level. He said:

To await action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal jurisdictions.

He concludes by saying:

I am well aware of the objections of lawyers to no-fault insurance. I can't help but feel that much of this complaint is based on the prospective loss of fees. This really is not a valid cause for objection.

This letter along with another from a lawyer who has been an insurance instructor in San Francisco and an orthopedic surgeon will be made a part of the record.

(The letters follow:)

MICHAEL, BEST & FRIEDRICH.
Milwaukee, Wis., April 6, 1971.

SENATOR PHILIP HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: This is to endorse the concept of no-fault insurance on a Federal level. To wait action by the individual states is ludicrous and in the interim period there is likely to be a rather chaotic state of affairs even as there is now to some degree in accidents between automobiles of various legal juris-

dictions. The automobile insurance game has reached the point where the rate structures threaten to collapse the whole automobile business. By way of example, I just received a notice from my insurance company declining to renew my insurance of my three cars. There has been no claim under my policy since the last renewal. Heretofore my annual premium has been in the order of \$920. Now they offer to insure me through one of their affiliated companies at extremely low liability limits for an annual premium of \$2,880, approximately triple rate for far less coverage with no claims or traffic violations since the policy was written! The only way I can beat that within that company's structure would be if I would buy my two children old automobiles and put minimal insurance coverage on them. This would then mean that two automobiles of questionable merit and with low coverage would be plying the highways instead of having the kids in proper cars with proper coverage. The insurance company will not recognize an exclusion of the children from specified cars within the family.

I am well aware of the objections of lawyers to no-fault insurance. I can't help but feel that much of this complaint is based on the prospective loss of fees. This really is not a valid cause for objection. Much of the trouble with insurance today relates back to legal fees and pumping up claims for pain and suffering, etc.

BAYARD H. MICHAEL

NEAR, FRIEDMAN & CRAWFORD,
ATTORNEYS AT LAW,
San Francisco, Calif. March 25, 1971.

Senator PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: Thank you for sending me a copy of your bill for a national no-fault insurance plan.

I have read it and believe it will go a long way to correct the remedies that plague our present system. I do not believe the states, who are in general under the thumb of the insurance lobby and whose members are mostly attorneys, will ever pass adequate legislation. The support for no-fault insurance is growing daily. Enclosed is the March 24, 1971 editorial from the San Francisco Chronicle strongly endorsing a no-fault system.

I do have a few objections to your plan. Perhaps these objections are misfounded, but I believe they might be of some value to you.

1. One of your provisions is that the insurance companies cannot refuse to renew unless the insured has his license cancelled or he refuses to pay the premium. What is to stop the insurance company from raising premiums substantially to anyone they wish to not renew? They can always say the new premium is necessary for *this* particular risk. I see rates going up astronomically for anyone insurance companies decide is undesirable.

2. I think that your plans to let rates be established by a file and use (open competition) type rating law will also lead to rates going up dramatically. I have accumulated some evidence to show that states with file and use laws have higher insurance rates than those where prior approval is required. Some of this evidence is contained in an unpublished article I have written, and I have enclosed a copy of that article. If interested, I could send you some additional evidence along this line. I have little faith in the fact that the Department of Transportation will be collecting various rates for different classifications and promulgating them to the public. The public hardly ever sees these government handouts, and the rates will all be high even if they see them.

3. The basic problem I see with the plan as you propose it is that by making the no-fault insurance compulsory, you will be placing a great many Americans under a severe financial strain, and I believe will create a new breed of criminals, those who drive without insurance. Whereas I heartily approve of compulsory insurance for motorists, I believe it must be at a price all can afford. To make someone pay \$200, \$300, \$500 or \$1,000 for a yearly premium, when he has a limited income, is very harsh. The system which I believe could work best is an insurance plan where all must buy a certain minimum insurance which covers all medical bills without regard to fault. Such a plan has been operating in Puerto Rico since January 1, 1970 and is widely accepted there. I am sure you are familiar with the Social Protection Plan in Puerto Rico (it is briefly described in my enclosed article) and I feel it could be modified in a national plan by 1) substantially raising the loss of wages to the levels set by your bill and 2) only

1971 MAR 25

allowing the tort remedy in cases of catastrophic loss as your bill does, although I believe your criteria a bit harsh.

I believe such a plan could sell in the states for \$50 or less, and this would give the American consumer the break he has long sought. Under private companies, especially with a file and use law to regulate rates, I believe insurance rates will stay very high. The purported 80% reduction in liability rates will be more promise than reality, and although the victim will be infinitely better off, the consumer will still end up paying through the nose.

At the very least, a "watchdog commission" should follow the insurance company rates and determine what constitutes a fair rate of return, what part of investment income should be used in determining the rates, standardize the casualty insurance accounting systems, etc.

In the long run, you are leading a grass roots revolution in the insurance field, and I for one think the only way the consumer will ever get a fair break is when a government agency sells him a policy.

An article entitled "A Call For Adoption of the Puerto Rico Social Protection Plan in the United States" by Jean B. Aponte and Herbert S. Denenberg, professors at the University of Pennsylvania who drafted Puerto Rico's Plan is also enclosed.

I realize the fantastic political pressure that would be involved in getting the government to sell the insurance rather than private companies, but the nation is ready for a revolution, so why not go for a complete victory, rather than a compromise that will still place many consumers of auto insurance under an enormous economic burden?

Sincerely yours,

GILBERT FRIEDMAN.

[From the San Francisco Chronicle, March 24, 1971]

THE 'NO FAULT' INSURANCE PLAN

The Nixon administration, having in hand a \$2 million two-year study by its Department of Transportation, has called for a drastic change in the system of automobile insurance under which drivers are now paying some \$12 billion a year in premiums and getting back about 14.5 cents on the dollar to compensate for economic losses.

It has newly urged Congress to recommend the abandonment of the present tort-liability, or lawsuit system, and suggest that each State enact its own version of the so-called "no fault" system—a system which in essence discards considerations of negligence and promptly and automatically makes benefits available to all accident victims without attempting to establish legal liability.

Adherents of such a plan may not agree as to details, but there is complete agreement that the present system is not working and must be replaced. Insurance companies complain that they are losing millions; the insured complain of zooming rates, and studies by both the Government and the insurance associations reveal that millions of injured accident victims are being grossly underpaid for losses, while a minimal few are fantastically overpaid by sympathetic juries for so-called "general" damages.

The American Insurance Association, representing some 30 percent of the insurers and a pioneer advocate of no-fault insurance, says that under a "pure" no-fault plan, accident victims would promptly recover all medical and hospital costs, and would receive up to \$1000 a month for loss of income, than in case of the death of a wage earner, survivors would receive funeral expenses and a continuing payment of the decedent's wages up to his life expectancy, and that an injured pedestrian would be covered by the car that hit him.

Various other benefits would accrue under such a system, the Association asserts, wherein insurance would be compulsory and no licensed driver would be refused coverage.

What is remarkable indeed is the claim that the cost to the motorist would be 30 per cent less than the premium rates now in effect—a boon made possible by the circumstances that no accident victim could sue or be sued. Thus the massive legal expenses incurred under the lawsuit system would be avoided and much of the approximately \$3 billion a year that now goes to lawyers and investigators would become available for benefits that would comprise around 65 per cent of the premium fund instead of the 14.5 per cent now being paid.

This in some part at least explains why most lawyers and most bar associations oppose the no-fault system. In addition their hostility is based on charges that

"no fault" shifts responsibility for accidents from the guilty to the innocent, that it gives the uninsured guilty benefits that the insured driver pays for, that it forces the owner to pay deductible losses, penalizes the car owners with large families, provides premium cuts for hot rodders, speeders and drunk drivers, confers immunity upon owners of commercial vehicles while shifting insurance costs to owners of private cars and eliminates property damages.

The "no-fault" advocates deny the major charges in full, and concede that some versions of the plan are susceptible in small part to the minor allegations. They argue further that the present system confers no direct benefits whatever upon the insured but actually protects the other fellow and does nothing for the insured but permit him to go into court and sue somebody.

The "no fault" concept is not new. It is, for instance in effect in Puerto Rico in a modified form which limits payments of salary and wages to 50 per cent. up to \$50. Saskatchewan has a plan that compensates for property damage but puts a \$1000 limit on medical and hospital expenses. In the United States, Massachusetts has the only no loss plan now in effect; with a medical limit of \$2000. it was instituted in January and experience to date indicates a saving in premiums of \$76 million for the year. Bills for a Federal plan are now before Congress and State plans are under consideration in various Legislatures, including California's.

How these plans will fare depends largely upon the depth and extent of public dissatisfaction with the present system, which is sharply rising. Thus "No Fault" insurance in various versions appears inevitable. In theory and from the limited experience available, it would also seem highly desirable.

THE PROFESSIONAL BUILDING,
Saginaw, Mich., March 31, 1971.

Sen. PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: Please accept my strong endorsement of your efforts to create a "no fault" automobile insurance system.

An inordinate amount of my time as an orthopaedic surgeon is taken to deal with insurance examinations, litigation, and court appearances in matters of automobile accidents and personal injury. I and my fellow orthopaedic surgeons could much better spend this time taking care of sick people.

Over the past few years I have been impressed by widespread opinion that justice is long delayed by cluttered court dockets. Surely removal of personal litigation from such legal proceedings would go a long way to free the courts to deal with more important matters.

Sincerely,

JOHN O. GOODSELL, M.D.

Senator HART. The orthopedic surgeon writes,

An inordinate amount of my time as an orthopedic surgeon is taken to deal with insurance examinations, litigation, and court appearances in matters of automobile accidents and personal injury.

And he concludes by suggesting that his skills could be better applied elsewhere.

Mr. HARING. I might say I think that is a very frequent reaction that I encounter with doctors.

Senator HART. It is the first time so far as I am aware of that in this set of hearings we have had this note introduced. I wasn't aware that it had this adverse effect on our society.

Having said all that, let me ask the question that so often is addressed us. "Why should I pay for damages to me if somebody who is a drunken driver hits me? Why propose a system that makes me pay for that?"

Mr. HARING. I think the virtue of such a system is, first, that you get paid and you know how much or can reasonably tell about how much you will get paid.

As far as the illustration of the drunken driver is concerned, which I think we have all heard in this debate again and again, I do not conceive that the function of the civil law is certainly primarily to punish and reward, and indeed juries at least in New Jersey are frequently instructed that they are not to award damages as punishment but simply as compensation. So, I think that compensation is what we need in today's automotive society.

As far as punishment, deterrence is concerned, that is as I conceive it primarily the job of the criminal law, and if the driver in your hypothesis is indeed drunk, he would be, at least in our State, punished severely indeed.

Senator HART. I am aware of no jurisdiction where the law would not mark him as one eligible for some sanctions.

There is another recurring theme in these hearings, and if you have a reaction to it we would be grateful.

When we step back a little from the day-to-day debates here, I think we would agree that there is a general acceptance of the idea that we should proceed to a no-fault system. There are some arguments as to form and so on.

Yes, the existing system is inadequate and inequitable; we will have a no-fault system. But let the States construct their systems. They would be more responsive to the character of their people and topography. If they don't move along then the Federal Government can act, and if later it is thought desirable that the Federal Government act we will have had the experience. Therefore, the Federal Government doesn't need to do anything right now.

Mr. HARING. Well, certainly I think many of us have traditionally thought that the idea of experimentalism and pluralism which is supposed to proceed from State legislation is good. However, I think in this particular instance, and I might say I am speaking for myself here, the urgency of the need may very well override some sometimes sentimental thoughts with respect to State control.

Looking at it realistically, it would seem to me that the accomplishment of no-fault in the State, and I am referring to my State, faces a very rough road indeed.

We do have, for instance, an insurance commission which is supposed to be looking into this question, among others. It was unfunded for 13 months and one of the Trenton newspapers recently characterized its reception of Professor Keaton as disgraceful and said that the validity of its final report might be open to question.

Also, a segment of the bar has hired a paid lobbyist, and I saw yesterday in the Newark News on the train coming down here that the New Jersey Bar Association's section on civil procedure, which is meeting in Atlantic City this weekend—in fact right now—may propose such things as a paid lobbyist and other steps with which to fight no-fault.

I think with this type of thing going on in the States, and with the greater susceptibility of State legislatures to local pressure, taken together with the urgency of the need which I believe no-fault fills that Federal legislation may be the only way to get it soon enough and to perhaps prevent a number of States from suffering through some bad experiments.

Senator HART. Thank you, I was not aware of the recent events in New Jersey. But I think it is something that could be anticipated in many of the States.

Mr. HARING. I would certainly think so.

Senator HART. You make a point in your prepared statement that in New Jersey 88 percent of automobile liability cases are settled out of court, and you conclude by saying that courts are "a marketplace for the arbitration and compromise of claims."

The administrative director of the courts of Cook County, the chairman of the National Association of Trial Court Administrators, said substantially the same thing a few days ago testifying before the House on no-fault. He said in some courts around the country only 2 or 3 percent are decided by trial litigation. He said that this statistic indicates to him that the court is being used merely as a forum for the claims adjustment process, and concluded, "In no uncertain terms the taxpayer is subsidizing insurance companies to negotiate its own claims within public facilities and on judged time."

Is there any chance you can go over to Atlantic City on your way back to Newark and tell the boys that?

Mr. HARING. I think, Senator, that some of the statistics which are derivable from the report of the administrative director of New Jersey may support the point which you were just making. The most recent figures which are available in New Jersey are for the court year ending August 1970, and for that year 56 percent of all civil cases filed were automobile liability cases. There were almost 50,000 cases pending that year and 58 percent of those cases were automobile negligence cases. There figures apparently have kept rising, and I see no reason to believe that they will not keep rising. In other words, a greater and greater percentage of court time and of lawyer's time is being taken up by this area of litigation.

Senator HART. Really this reaches a little, but those who are concerned with the problem of law and order and are willing to listen suggest that there is more of a problem of solution than streetlights and more policemen. You point to the delay in the trial procedures of men and women charged with crime; you make the point that until there is a prompt disposition of an arrest you are contributing to a breakdown of law and order.

The principal contributor to the delay in the processing of the arrested person is the statistics that you and I have just been talking about.

Mr. HARING. Yes, I think that is true. I think it is certainly a fact, although I don't have the figures readily at hand, I believe most of us assume, and assume correctly that the criminal calendar certainly in the metropolitan areas such as the one I come from have become very heavy indeed. Criminal trials must be prompt. They should, I believe, be more prompt than they are.

Senator HART. And while judges and prosecutors in most cases do their very best to keep the criminal docket current, any court burdened with the kind of auto cases we are talking about is going to have an awful fight to stay abreast of its responsibility to move the criminal docket.

Mr. HARING. No question about that.

Senator HART. Had you given any thought to the possibility of providing on a first-party basis coverage for pain and suffering and catastrophic harm?

The reason we raise this question with you, we are talking about the burden of litigation and the uncertainty of it, and yet we are faced with the need to attempt to provide for recovery of pain and suffering in the so-called catastrophic type of injury, but rather than having that litigated on the tort basis, the suggestion is now surfacing that we ought to put that on a first-party basis, too. Do you have any reaction on that?

Mr. HARING. I do. I don't know how helpful it may be. The thing which I believe is disturbing about recoveries for pain and suffering is the incommensurability of pain and suffering and dollars. I, therefore, believe that payment of expenses and rehabilitation is more important, not only to society but quite probably to the individual concerned.

It is very difficult indeed to measure pain and suffering, and I suppose that first-party insurance which was for some predetermined amount over and above the wage loss and medical expenses could be provided if a person wanted to buy it.

I am aware that there has been testimony which would advocate an elimination of the catastrophic harm provisions of the bill before your committee.

I would think that pure and theoretic consistency might dictate the obligation of the catastrophic harm provisions.

On the other hand, I question whether consistency is always the aim of legislation and there is a tradition of recovery established here which I think many people in catastrophic cases might like to see continued.

Senator HART. Mr. McGoldrick, is there anything you would care to add as a result of our exchange?

Mr. MCGOLDRICK. No, I don't believe so, Senator.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. I have no questions of the witness.

Senator HART. Again, thank you, and I would hope you would convey our thanks to your associates for this kind of thoughtful testimony.

Mr. HARING. I certainly will, Senator, and I thank you for your very gracious reception.

(The statement follows:)

STATEMENT OF EUGENE M. HARING

My name is Eugene M. Haring. I am a practicing lawyer with offices in Newark, New Jersey. My practice extends throughout that state. During a substantial part of my professional experience, I have been responsible for much of the litigation conducted by my firm, which is one of the largest in New Jersey. I have been responsible for a wide variety of litigation, including automobile negligence cases, life insurance, health insurance, disability insurance, and products liability cases. In the course of this I have been responsible not only for the trial of cases, but also for the training of young lawyers in the litigation field. My professional experience has made me particularly aware of the effect of automobile negligence cases on the legal process in New Jersey.

Because of my personal concern I am affiliated with a group of New Jersey lawyers from all parts of the state, called The Lawyers Committee for No-Fault Insurance. This is an unfunded, voluntary group; it speaks solely for its members and, we believe, the public interest. Co-chairmen of this group are Charles Danzig, Woodruff J. English and Donald B. Kipp, all distinguished lawyers of broad experience in positions sensitive to the over-all legal process in New Jersey. In addition, among the sponsors of this group are Alfred C. Clapp, former Republican State Senator and former Presiding Judge of the Appellate Division of New

Jersey, and Bernard Shanley, New Jersey Republican National Committeeman and former counsel to President Eisenhower. This is not a political group. It is non-partisan. It is comprised of Republicans and Democrats.

The co-chairmen of the New Jersey Lawyers for No-Fault Insurance have approved a brief statement of position. It is as follows:

"The members of the Lawyers' Committee for No-fault Insurance, along with many others, are concerned with the consequences of our present methods of handling automobile liability litigation. Those consequences include court congestion, delay, expense, and inequities visited upon the public. The Committee fears that if prompt steps are not taken to rectify and reform existing practices and procedures, there will be a further loss of public confidence in our legal institutions and their responsiveness to changing needs.

"The Committee believes that the present system of handling automobile negligence litigation has demonstrated itself to be deficient in logic, in law and in practice.

"The present system relies upon ancient tort doctrines, developed long before the advent of the automobile. It combines these fault doctrines with the concept of third party insurance. The result is that courts and juries are used to find fault—so that someone other than the wrongdoer, namely the insurance company, will pay. Our Courts are thus overburdened and at times overwhelmed by cases inappropriate and unsuited to their historic function. The result is inequitable payments, or none at all, inordinate delay, unreasonable expense to the taxpayer and the policyholder, and the sacrifice of judicial time which would best be spent on issues of more widespread and compelling significance to the public.

"Recent statements by a vocal segment of the Bar—primarily those specializing in the trial of automobile negligence cases—may well have the effect of misleading the public to believe that lawyers as a class are opposed to change or improvement in the system which presently exists. The Lawyers' Committee for No-fault Insurance wishes to dispel any such impression.

"While the Lawyers' Committee approves the concept of no-fault insurance, it presently favors no specific no-fault plan over any other. It is convinced, however, that the present system of disposing of automobile cases—the use of intricate and expensive court machinery which was devised to deal with different types of problems—is less than satisfactory. The Committee believes that the existing system ill-serves the public for whose benefit the law, and lawyers, exist.

"Accordingly, the Committee urges that a new system—a no-fault system—be tried. The weaknesses of the existing system have been so abundantly demonstrated that it is clear that palliatives and patchwork will not alleviate, but can only aggravate, the serious problems which undeniably exist. Basic and extensive reform is required.

"The Committee speaks only for itself. The lawyers comprising the Committee do not purport to speak for the clients of any of the Committee members nor for any other organized group. Too frequently, professional organizations are accused of narrow or selfish attitudes towards specific problems confronting their profession. The Committee would impress upon the public that a significant segment of the Bar speaks for what it conceives to be the public interest.

"It seems to be agreed by all who have considered the problem that there is urgent need for reform. Most studies indicate that some form of no-fault insurance is the most reasonable road to reform. We believe that some form of no-fault insurance should and will ultimately be adopted in the automobile liability field. It would be unfortunate, indeed, if the public were misled by a vocal segment of the Bar to believe that all lawyers are insensitive to the urgent need for reform."

Under the New Jersey Constitution the Chief Justice of New Jersey is directly responsible for the administration of the courts and must be in close touch with the judicial process in all the courts of the State. Chief Justice Weintraub of the New Jersey Supreme Court has stated publicly that he favors some form of no-fault insurance. The Chief Justice has pointed out that given today's traffic congestion accidents are inevitable. Indeed they are statistically predictable. Given the split second accident, resulting from inadvertence, the Chief Justice has said we cannot speak realistically of fault. Chief Justice Weintraub has said that accordingly there is not a fair basis upon which to fix fault, that if he thought fault were just, he would not advocate no-fault. He has pointed out that accidents happen so quickly that witnesses simply cannot recall and reconstruct the facts. The Chief Justice says that saving court time by a no-fault system is a mere incidental benefit, that he would not advocate no-fault merely to have

court time, but that given the split second quality of accidents, their inevitability and predictability, a no-fault plan is the just and equitable plan. His basis for advocating no-fault is fairness and justice.

Quite apart from the position of the Lawyers' Committee, I would make a few personal comments from my experience as a New Jersey trial lawyer.

I am not here representing any vested interest. I am not here for labor. I am not here for business. I am not here for the insurance industry. I am here on my own. I bought my own ticket on the Penn Central.

New Jersey is the most densely populated state in the nation.¹ The density of automobiles in New Jersey is the greatest in the nation.² Accordingly, the problems which arise from the present automobile liability system are particularly severe.

The tort, or fault, system, combined with this great number of automobiles and third party insurance, have an intense impact on the courts, on lawyers and, most important, on the public.

During the New Jersey court year ended August 31, 1970, the last year for which figures are available, 56% of all civil cases filed were automobile negligence cases. Of the total of almost 50,000 cases pending, 58% were automobile negligence cases. These figures are rising; automobile cases are taking up a greater and greater percent of our court calendar. While 88% of the automobile cases were settled before verdict, they still accounted for more than 66% of all jury trials.³

What is this third party insurance system, this fault or tort system?

Under the tort or fault system in New Jersey, in order for an injured person to recover, fault must be proved, blame must be fixed. If fault is proved, then and only then, the defendant must pay. If the plaintiff, the injured party, was also at fault, he cannot recover.

We do not, in practice, operate under a pure fault system.

First of all, we all know that the guilty party, the wrongdoer, the person responsible for an accident, does not pay. His insurance company pays.

Secondly, what we do, as distinct from what some lawyers say, is attempt to provide compensation for the injured—but within a fault framework. Compensation, rather than fault finding, is the aim of financial responsibility laws, uninsured motorists laws, collision and medical payments insurance.

Indeed the principle of compensation becomes most evident in the usual settlement conference which precedes a jury trial, and by which process the vast majority of cases are disposed of.

At least by the morning of trial it becomes plainly evident that fault is not some absolute moral principle. It is what a jury says. Given a split second accident which occurred years ago, jury verdicts are predictably unpredictable. Hence, the settlement conference—the trade of certainty for risk.

Customarily a settlement conference involves the application of very practical considerations going well beyond the law applicable to the case. The seriousness of the plaintiff's injuries, the personalities and appearances of the witnesses, the extent of the defendant's insurance coverage, the common inability of the individual defendant to pay, the degree of the plaintiff's negligence, all have a most important bearing on how much the injured party will receive. Such considerations are more influential in determining the amount the injured party will receive than his specific economic loss. Thus, when receiving a case for a badly injured client, one of the first questions a lawyer asks is how much liability insurance the defendant carried. The serious case, such as brain damage, may be worth \$10,000 or \$100,000. It depends on the amount of insurance carried by the other driver. Therefore, drivers play a game of roulette. If they have an accident, no matter how seriously injured they are they may well get very little, but stand a slim chance of hitting the jackpot. The recovery depends on how much insurance a stranger buys.

In fact, we are operating under an internally inconsistent system. We are trying to move in two directions at once. On the other hand we operate within a system designed to prove fault and to reward the innocent. On the other hand we apply principles of compensation with little regard to fault.

The result is uncertain compensation and frequently inadequate compensation, provided by a highly expensive system which was designed to determine fault.

¹ See, e.g., Federal Highway Administration and Bureau of Census Statistics as quoted in *World Almanac* (Newspaper Enterprise Assn., Inc., 1970) p. 408, 700.

² *Ibid.*, p. 127, 700.

³ Preliminary Report of the Administrative Director of the Courts for the Court Year 1969-70, (Administrative Office of the Courts, State House Annex, Trenton, N.J.).

Basic protection, self insurance, or as it has come to be called, "no fault insurance" would do what insurance was originally supposed to do—spread the risk and provide a certainty of payment.

You are well aware that highly vocal, and at times shrill, objection to no fault insurance has come from members of the legal profession. The familiar system seems simpler and more comfortable. Undoubtedly, much objection, while entirely sincere, proceeds from sheer inertia and visceral opposition to change. You know from recent testimony that some of it proceeds from sheer interest. But the duty of a profession, and particularly the legal profession, is to meet the needs of the public as they arise. The law—and lawyers—must adapt to change. The profession, after all, exists to serve the public, not the other way around.

The argument is frequently heard that no fault insurance would reward the negligent driver. This is an invalid argument. With the conditions of driving today there is not one of us who is an infallible driver. There is not one of us who has not made driving errors and thanked God that we and others escaped harm. Under the existing system if another car is involved when such an error is made, and if we receive serious injuries, we are subject to a most drastic form of retributive justice indeed. We may pay for our mistake by the loss of a limb, blindness, disfigurement, and, since we were at fault, receive no compensation whatsoever. On the other hand, a no fault system promotes family integrity, rehabilitation and the self respect which comes with it. This has obvious social benefits.

My office is in Newark. That city and much of New Jersey is beset by those social and economic and racial problems which afflict urban areas throughout the nation.

Problems with respect to environment, products liability, consumers' rights, and the accommodation of conflicting interests of economic and racial groups more and more require and demand the attention of our courts both on the civil and criminal side. The need for resolution of such problems is compelling. The time and careful attention of our courts to such problems is required. Cases involving important current social and economic issues have a far-reaching effect. The garden variety automobile liability case has no such effect. Our expensive judicial system should and must be used to a greater degree on problems of broad significance. Current problems are too compelling to tie up the time of juries and judges to decide which driver entered an intersection first.

Problems created by the glut of automobile liability cases are not quantitative alone. They are also qualitative.

You will recall that in New Jersey 88% of automobile liability cases are settled before verdict. Accordingly, our courts are used largely not for the trial of cases at all, for which they were designed. They are a marketplace for the arbitration and compromise of claims. Frequently the talents called upon are not so much those of the trained lawyer or judge but those to be found in a Turkish Bazaar. The time of lawyers and of judges is used to decide somehow the trading value of a whiplash injury, a broken arm or loss of a leg. Their time could be used more productively.

I submit that the legal profession in the United States is one of the most valuable assets this country has. Its energies and talent should be directed to the more important problems which we face. A system which diverts so much legal talent to automobile liability settlements and trials, wastes a valuable national resource.

There is something to be said for the experimentalism and pluralism resulting from state rather than federal legislation. On the other hand if our state is any example, pressures of certain interested groups may be more effective in defeating necessary legislation than they would be at the federal level. There are bills in the New Jersey legislature which would enact some form of no-fault insurance.⁴ Debate within the State is escalating. A vocal segment of the Bar has hired a paid lobbyist. An Insurance Commission is investigating no-fault insurance. However, its reception to Professor Keeton was characterized by a Trenton newspaper as "disgraceful." That newspaper raises questions about the Commission's objectivity and the validity of the report it will ultimately submit.⁵ Obstacles to no-fault legislation in New Jersey may be formidable.

There is something to be said for no-fault legislation at the state level, if it can be enacted. There is something to be said for a Keeton-O'Connell type plan which preserves the right to sue in some cases. However, the situation as it presently

⁴ Assembly, No. 2302, Introduced March 29, 1971; Assembly No. 2423 Introduced April 24, 1971.

⁵ The Trenton *Trentonian*, April 16, 1971, p. 24.

exists is so bad, and the need for reform so great, that a sound no-fault plan, offering hope of prompt enactment, should be supported.

There are numerous no-fault plans, ranging from the Massachusetts Plan, with very low limits, to the Keeton-O'Connell Plan, with limits of \$10,000.00 for lost wages and medical bills and \$5,000.00 for pain and suffering, to the open-ended plan proposed by the Stewart Commission in New York, under which almost all suits for general damages, or pain and suffering, would be eliminated.

The Bill before this Committee, S.945, combines good aspects of all these Plans. It would provide all reasonable medical expenses, would reimburse the injured for necessary services, and—very important—would provide all reasonable expenses for rehabilitation. At the same time it limits reimbursement for wage loss to \$30,000.00. It does not eliminate, as the New York Plan would, recovery for catastrophic harm. Thus, limits are set upon the coverage while the victim of catastrophe may bring a legal action to receive a prompt decision in a court uncluttered by thousands of small automobile liability cases.

Criticisms frequently heard of the State Bills relate to the out-of-state accident and the out-of-state driver. While this problem is not insuperable on a state level it would be eliminated by the proposed Federal Bill.

We need a self-insurance system. We need a no-fault system. We need prompt, well considered reform. I personally believe your Bill would provide it.

Senator HART. The committee had been hoping that Senator Spong of Virginia might have been able to join us at this time. He has asked me to express for the record his regrets that he could not join us to present a distinguished Virginian.

Senator Spong suggested to me that our next witness' long experience in the State legislature and at the bar gives him some rather unique background out of which some constructive suggestions should be anticipated.

Having spoken for Senator Spong, let me welcome Mr. George E. Allen of Richmond.

STATEMENT OF GEORGE E. ALLEN, ATTORNEY, ALLEN, ALLEN & ALLEN, RICHMOND, VA.; ACCOMPANIED BY CARY BRANCH

Mr. ALLEN. Mr. Chairman, I feel highly honored to be permitted to appear before a Committee of the greatest deliberative body in the world. I hope I may be able to be of little help to you.

Senator HART. Thank you, sir.

Mr. ALLEN. This is one of my partners, Mr. Cary Branch. He is not going to make a statement, but I understand questions may be fielded to him.

As you will observe, Mr. Chairman, my statement is divided into two parts; one, that the matter of automobile reparations should be left to the States at least temporarily until there is some experimentation, and the other will be on the merits.

May I ask that I be notified when I have spoken 10 minutes?

Senator HART. Yes.

May I state that your statement will be printed in the record in full.

Mr. ALLEN. I am just going to very briefly summarize it. But first I would like to give you a little information on myself.

I was graduated from the University of Virginia Law School in 1910. I have recently been awarded by the University of Virginia the degree of doctor of laws. I have practiced continually since 1910 in the various state and Federal courts through the U.S. Court of Appeals for the Fourth Circuit and the Supreme Court of the United States. I was elected State Senator in 1916 and served through 1920. I am recipient of Award for Distinguished Service in postgraduate

education of trial lawyers, The Law Science Institute, 1953; Award for Courageous Advocacy, American College of Trial Lawyers, 1965; co-author, "Torts" Annual Survey of Virginia Law, Virginia Law Review, December 1960. Faculty member in legal medicine and medicolegal litigation, the Law Science Institute, 1953-54. Member, American Bar Association, Virginia State Bar, the Virginia State Bar Association, Virginia Trial Lawyers' Association (president, 1960-61), Richmond Bar Association (vice-president, 1958-59, president, 1959-60), American Trial Lawyers Association (vice-president, 1951-53; member board of Governors, 1954-56; associate editor in personal injury law, 1951—, president, Virginia chapter, 1952-53), American Judicature Society. Fellow American College of Trial Lawyers. Fellow and cofounder, International Academy of Trial Lawyers (member, board of directors, 1954-56; dean, 1965).

This great country of ours extends from Canada to Mexico, the Atlantic to the Pacific, and then Hawaii and Alaska. It is comprised of 50 States with varying circumstances and conditions in the States. It presents an ideal situation for experimentation on this subject in any of the States and to see how the matter works.

We have a judicial system in Richmond which we think is far more adequate than any of the no-fault systems. I am going to briefly refer to that.

Whether you know it or not, in 1918 Virginia passed the first "no-fault" act.

Senator HART. What year was that?

Mr. ALLEN. 1918. It was confined exclusively to accidents in the industrial field. I was practicing law then and our principal practice in the personnel injury field was actions by employees against employers under the master-servant doctrine. This act, of course, abolished all those actions, but I thought that the act would be of benefit to the workers and the State as a whole and I voted for it and supported it strongly.

We were told that all you would have to do—all that a worker would have to do would be to present this claim to industrial commission and it would be paid. But the results did not prove out that way. The few sections of the Code of Virginia which contained the Workmen's Compensation Act contained 47 pages of annotations in fine print, two columns to the page on this act.

Mind you now, they are only cases that got into the court of appeals. Heaven knows how many were contested in the lower courts. The various and sundry phrases in the Workmen's Compensation Act were defined, interpreted and construed time and time again.

Now, with the adoption of this no-fault plan, the bill itself, I believe, contains 24 pages, and the various and sundry phrases, which are used are unknown to the law, and the flood of litigation that would ensue concerning the interpretation and definition of those different phrases in the application of the law would be beyond the comprehension of the finite mind.

In Virginia we think we should be left alone at least temporarily to work out our own system. We are all the time making changes in it. We have abolished some of the common law defenses. We are on the road to abolishing others. We have in our State exceptionally good judges who are courageous in exercising their powers to maintain the

der. The General Assembly of Virginia is generous in giving us good judges, plenty of them.

Both sides of the bar under the rules of our practice are required to cooperate and disclose their full case to the other. If they do not, the court will make them. The result is both the lawyers for the plaintiff and defendant get together and make a full disclosure and over 90 percent of our cases are settled before trial for sums satisfactory to the parties, and in fact many of them are settled before suit is even filed.

As to the approximately 10 percent of the cases that are not settled without trial, perhaps half of them are decided for plaintiffs and maybe half for defendants, and then of those cases less than 5 percent of them ever get to the supreme court because we have a procedure which requires a person appealing to apply for an appeal and show good cause for one or he never gets in the court of appeals.

Now, half the applications for appeal—I have examined reports on this—are turned down to begin with, and the half that are granted—over half of them are affirmed. So you see the appellate judges do a pretty good screening job.

In Virginia we can get a trial even in a city like Richmond in 4 or 5 months after institution of the suit, and perhaps sooner in other sections of the State. We try a personal injury case in Virginia in less time than it takes to select a jury in many of the States. And that is because under our rules of practice and procedure lawyers are not allowed to examine jurors on the voir dire but very little. Lawyers are required to get all their information about jurors before they come to trial, and we have a man in our office whose business is to do that.

And when the trial lawyer goes to court to try a case he is handed a statement with check marks on it for striking off jurors. He has a right to strike three without cause, and then he can strike others by showing cause. So we select a jury in less than 5 or 10 minutes and get right on with the trial.

Now, my information is that most of the people who would be affected by this type of legislation consist of poor people, both blacks and whites, and middle class folks. I have been trying cases for a little bit—well, come June it will be exactly 60 years. I have never had to try but one case for a banker, never for an executive. Now, the reason is, either they do not have accidents or if they have them their prestige permits them to settle without even filing a suit, and insurance companies pay them off. That is the only way I can figure that out.

Now we see, therefore, that the legislation proposed here applies almost entirely to the poor people and the middle class people. But we do not know of anybody who has made a survey among those people as to what their preference is or whether or not they are satisfied as the law is administered in Virginia.

Now, if it be said that my views are selfishly motivated, I can only respond by saying that was not the case with the Workmen's Compensation Act. I worked for it and voted for its passage but was greatly disappointed in the result.

There is one late report on this subject that I think the committee ought to see, and it is just out I believe in March of this year, and that is the report of the American College of Trial Lawyers. That, as you know, is one of the most prestigious organizations of the bar in the

country. They studied the subject and the men who were appointed on that committee are among the brainiest lawyers in the United States from one end to the other of this country.

The report is fair and reasonable, and I submit it would be of interest to this committee, and I am going to leave a copy of this report on the table, some 25 or 30 copies of it.

Senator HART. We would appreciate receiving it in that quantity. My impression is we have available a copy, which was submitted by the American Bar Association when they testified.

Mr. ALLEN. This is the American College of Trial Lawyers I am talking about, and the American Bar Association, of course, has made a report, too.

Senator HART. Yes, but when the American bar's testimony was received, among the witnesses was a member of and spokesman for the American College of Trial Lawyers.

Mr. ALLEN. Yes, sir.

Now, in reference to my view being that of a trial lawyer, I am reminded of the most eloquent phrase of the late John F. Kennedy in his state of the Union message to the Congress: "Seek not what your country can do for you but what you can do for your country."

Believe it or not, I am motivated by the idea to do something for the working people, and our system needs improvement, but give us a chance to improve it and that will be done.

Just a moment on the merits of the case, the scope of this field is just simply tremendous.

I was chairman of the automobile law committee of the American Bar Association in 1960. I appointed a subcommittee at that time to deal with this very subject, and the committee was composed of very able men and the committee was chaired by FitzGerald Ames of California who later was designated as a judge out there and he is today a judge in California. He wrote the report. It is the best thing on the subject that I have ever seen, and it was written back in 1960.

Now, that report—I had a very difficult time finding it—I will just show you what it is, and I will be glad when I get back to have that copied and send as many copies up here as you would like. But you have not seen anything like that I am sure, and it goes right back yonder to 1960.

When we come to this no-fault insurance, there are apparently three groups of differing purposes under the no-fault. One is espoused by Travelers and Aetna Insurance Co., and a copy of Travelers' is attached, I think, to our statement.

Examination of their proposal would indicate less coverage and greater expense than is provided by an ordinary accident policy. Now, why is it—I know I have years ago carried accident policies that paid me if I got hurt driving an automobile or riding in an automobile or was struck by an automobile, paid me a substantial sum, paid me hospital and doctors' bills and loss of wages and things like that, and the premium was just unbelievably low for that type of insurance.

That would be no-fault, and the legislators of the States or the Congress could require a person to take out that type of policy before getting a license to drive a car, and that could be supplied and it would not interfere with our common law doctrine and the progress and development of the common law in the States.

Another group is represented by the plans of Professors Keaton and O'Connell and the present law of Massachusetts. Their objectives appear to eliminate small claims, reserve to more seriously injured persons their present rights and also provide some medical coverage and indemnity coverage to all. A person must certainly be naive if he thinks a policy can be written like that and reduce the premiums.

Now then, the third plan I believe is expressed very well in Senator Hart's bill, the effect of which would take from the innocent what they are entitled to recover and pay it over to the guilty who ought to carry insurance for his own protection in the way of some form of accident insurance.

I understand, too, that property damage accounts for about two-thirds of the premiums on these insurance policies. Well, that is not provided for in the bill. Are we to proceed at common law to recover property damage?

Now, Mr. Chairman, I believe that is about all I have to say, sir; and I thank you.

Senator HART. Mr. Allen, and we were joined by the able senator from Alaska, Mr. Stevens, just as you were beginning, and I know I speak for him, we not only welcome the information you have given us but we appreciate the opportunity to listen to someone who lived 60 years of trial experience, and speaking from that background your counsel is certainly entitled to the very highest consideration.

As you commented, my bill suggests that we approach it from a different point of view. You raise the only point I would like to respond to, not in the form of a question but by way of an explanation for the action that I suggest we ought to take.

You note that the Secretary of Transportation, Mr. Volpe, has recommended a change from the tort system for the reason that it is not working well in that some people obtain more than they should and others do not obtain as much as they should. You go on to say that is true, the jury system is not perfect, but it is the best that we have yet devised to resolve disputes between parties.

The figures that we have been able to develop, though, suggest that the inadequacy in the existing system is very substantial and of such size that I am persuaded we ought to move to the no-fault. The less seriously injured party, persons whose injuries are under \$500 in terms of hospital, doctor and so on, a person with injuries accounting for \$500 or less of economic loss are paid five times—averaging—are paid five times their economic loss. Those with more serious injuries, those whose economic loss exceeds \$25,000 recover only a third of their economic loss.

Now, that to me is disturbing enough, but when you ask the next question, well, who are these people? Well, there are many categories that we can cast ourselves in as citizens, but if you had an eighth-grade education, we discover that you get 25 percent of your economic loss; if you have a college education you get 64 percent; and another way to describe these income brackets, if your income is less than \$10,000 you recover substantially less of your economic loss than if you are in the above \$10,000 bracket.

So it is a redistribution to eliminate this kind of disparity that persuades me to move for a no-fault.

Senator Stevens.

Senator STEVENS. I, too, join the chairman in expressing admiration for anyone who has been a member of the bar for as long as you have, Mr. Allen.

I have just spent the morning on some cases coming out of the Indian Claims Commission which are related to a certain extent where the Government is finally paying for great wrongs that were done in the past to some of our native people, our Indian people, and I think the fact that you have been practicing since 1918 we ought to listen to some of your counsel.

Mr. ALLEN. Since 1910.

Senator STEVENS. Since 1910.

I notice your comments concerning the experience of Virginia in the industrial accident field. On the other hand, the chairman certainly has a point in terms of those personal injury cases that affect injured people who are in the lower economic brackets. As a lawyer, do you think we could not devise a means to deal with that portion of the spectrum as we have in social security and others and not deal with these cases that deal with the higher economic brackets?

Mr. ALLEN. Certainly we could. I think a very cheap accident policy with coverage of persons driving in an automobile, riding in an automobile or being struck by an automobile, an accident policy like that can provide substantial sums and the motorist should be required to take such a policy before he gets a license to drive a car. That can be done.

Senator STEVENS. I think we are more interested in some of the expenses that are incurred by those people who are in that spectrum of the economic scale where the costs of their litigation come directly out of the direct injuries that they suffer, either personal or property damage, and that the cost of litigation comes out of what they recover. When you get to the higher spectrum I think you get into the concept of future earnings and perhaps some pain and suffering concepts that have led to the larger verdicts. But the cost of litigation does not come out of actual injury.

Do you see a difference in treating these personal injury cases for people in lower brackets?

Mr. BRANCH. In my experience of having represented people who are hurt, having defended claims asserted against people, I take issue with the thought that the richer people get more money than the poorer people. The reverse is true; if you have a given injury to someone in the higher income bracket, my experience is that the juries give them very little, because such injuries seldom affect their earning capacity. A bad knee of a lawyer would mean very little, but where you are dealing with a truckdriver a bad knee is very important.

You take a spine fusion and the settlement value of one of those injuries to an executive type who sits in a chair or a lawyer is hardly more than the actual loss to the time of recovery. But those injuries leave the workingman with permanent disability, and jurors in their verdicts take the future loss of earning capacity into consideration. So, opposed to the thought those in the lower income brackets usually obtain a good deal more for the same injury—any type of injury, except on involving a brain injury to an executive or something, that would affect his earning capacity, but the run-of-the-mill cases, the

lower income people get a good deal more because any physical injury is more important to him than it is to the executive.

That is the general experience of myself and the insurance people with whom I deal.

Senator STEVENS. I appreciate your opinion.

As a lawyer who has practiced for 20 years, I happen to feel in the normal personal injury case where someone is in the very low portion of the economic spectrum, the cost of the litigation alone costs him more than someone in the higher spectrum.

Mr. BRANCH. The cost of litigation probably does. In the higher income brackets quite often they do not make a claim, and if they do they are able to handle it themselves and deal directly with the companies, because such claims and such injuries to them they do not consider as important as the same injury to the workingman in the trade, and the workingman in the trade apparently is the one who does not feel competent to deal with the companies so they employ the lawyers. But in any event they usually obtain, relatively speaking, one who works in the trade with an injury, that injury is much more important to him and he gets much better compensation for it than the one who does not work with his body, so to speak.

Senator STEVENS. Thank you very much, Mr. Chairman.

Senator HART. Mr. Allen, let me thank you also for reminding us of the experience that you had in Virginia when you enacted that workmen's compensation legislation which was followed by a massive series of arguments over what it meant. I would hope, given the reminder that you have provided us, that if we do move in their area and do write a Federal statute, that we will be able to use the dictionary wisely and hopefully learn from the lesson that you have recited.

Gentlemen, thank you very much.

Mr. ALLEN. Did I understand that you would want me to make some copies of this?

Senator HART. Yes, please.

Mr. ALLEN. I will leave you with copies from the trial lawyers association.

I am going to leave you something else. You said something about the position I took in the Workmen's Compensation Act. Read my book, "The Law as a Way of Life," and the chapter on my philosophy of life, and you will not be surprised that I took that position.

Senator HART. Thank you.

(The statement and appendixes follow:)

STATEMENT OF GEORGE E. ALLEN

THE FIELD OF AUTOMOBILE ACCIDENT REPARATIONS SHOULD BE LEFT TO THE STATES AT LEAST UNTIL THERE IS FURTHER EXPERIMENTATION IN THE FIELD

It has been a favorite thesis of Justices Brandeis and Frankfurter that the states are important laboratories for social experiment. This is not perhaps true equally for all legal problems, but it seems to us especially persuasive for auto reparations. Evaluation of auto plans involves assumptions about costs, claims consciousness, fraud, deterrence, settlement behavior, lawyer behavior—assumptions on which experience with actual operation will shed much light. Moreover, the change from the common law to a plan is likely to be an irreversible change; it will be difficult to retrace our steps if experience proves the change unwise. It would be imprudent therefore with things in this posture to change the tort law everywhere in one single giant step.

appointed to a judgeship in California. He wrote the report. It covers every phase of the subject and is well documented by both facts and figures. Just to give you some idea of the subjects discussed, the subject of Chapter 8 is "Workmen's Compensation and Automobile Compensation Plans, Not a Comparable Analogy." Chapter 4, "Court Congestion and Delay Can be Eliminated Without an Automobile Accident Compensation Commission." Chapter 5, "The Inadequacy of the Commission System to Handle Automobile Accident Litigation." Chapter 8, "Court and Jury System Adequate to Determine With Reasonable Accuracy all Issues Presented in Automobile Accident Litigation." Chapter 10, "The Exclusion of Automobile Property Damage from the Benefits of the Proposed Compensation Plan Would Require Motorist to Carry Voluntary Public Liability Coverage at Additional Premium Cost." Chapter 13, "The Cost to the Taxpayer of Administering an Automobile Compensation Plan would be Greater than the Present Cost of Handling Automobile Accident cases Before Courts or Juries." Chapter 14, "Proposed Benefits under Automobile Compensation System would be Unconscionably Inadequate—to Provide Adequate Benefits would Result in Exorbitant Premiums." Chapter 15, "Average Attorneys' fees Recovered Under Present System of Handling Automobile Accident Cases is Fair Considering Contingency Risk Assumed by Attorneys and Recovery Procured for Client." Chapter 16, "Automobile Compensation Commission not Needed to Reduce Accidents or Promote Safety on Highways." Chapter 17, "Volume of Highway Accidents Does not Create any Economic Necessity for Special Legislation against this Type of Litigation." Chapter 18, "An Automobile Compensation System Would Create Multitudinous Conflict of Law Questions which Would Render Plan Unwieldy, Unjust and Unworkable." Chapter 19, "Constitutionality."

If the members of the Committee desire a copy of this report, I shall be glad to have copies made and delivered to them.

I have followed the progress of the various proposals for "no fault" insurance that have been made since Professor Keaton and O'Connell first wrote their book. Perhaps I have missed some particular study but if there has been one seeking the views of those people who were innocent of fault and who suffered injuries, such a study has escaped me. If no such study of that group of our citizens has been made, one would wonder why since they are the ones who are directly and adversely affected by the proposed legislation. Perhaps no such study was considered necessary because it can be acknowledged from the fact one is known as a plaintiff seeking damages for an injury wrongfully caused him, it can reasonably be assumed that not one of them throughout the land would favor the proposed bill of Senator Hart if the terms thereof were clearly explained to him. I can certainly state I have never met anyone asserting what he considered a just claim for damages who would favor such legislation.

There appears to be three groups of differing purposes all asserting their points of view under the banner of what has been termed "no fault" insurance. The objective of The Travelers and Aetna Insurance Companies who purport to support such a plan, is set forth in a statement of Travelers' position which, according to a talk I heard made by an Aetna underwriter, is generally the same as Aetna's objective. A copy of Travelers' position is attached as Appendix A. It should be noted or easily ascertained that accident (not including health) is the very cheapest form of insurance on the market. If such coverage were limited to accidents involving a particular car and limited further by a requirement that the company pay only medical expenses or lost wages in excess of or not payable from some other source available to the injured party, such limited coverage would obviously be so cheap that I don't know of any company making any effort to sell such coverage. However, it is relevant to note there is coverage available from Travelers as a rider on their auto policies that will pay \$10,000 death benefit and \$50 weekly indemnity unlimited up to age 65 for a yearly premium of \$10. Medical expense coverage costs approximately \$10 a year for \$2,000 limit and \$18 for \$5,000. A Travelers' agent advises also there is available straight accident insurance (not limited to autos and to pay regardless of other insurance or benefits) for a yearly premium of \$40 to \$60 for weekly indemnity payments of \$75. These weekly payments can be adjusted according to insured's income and premiums vary according to occupation.

When Travelers state that for such extremely limited coverage as they are proposing, they would want a premium of approximately 85% of the existing liability premium, their motive is readily apparent. If the law were to create such a market for the companies at such a premium as they are suggesting, that would truly be a bonanza to those companies. As indicated, however, the law would have to create their market because it is hardly likely that anyone would

want to pay any premium for coverage that in most instances would pay no benefit at all.

There is another group also proposing coverage under the term "no fault" insurance whose objective seems to be entirely different from the insurance companies' objective. This group includes those who believe in the plans of Professors Keaton and O'Connell and the present law in Massachusetts. Their objectives appear to be to eliminate small claims, reserve to the more seriously injured their present rights and to also provide some medical expense and indemnity coverage to all. They seem very naive to think that such a plan could reduce premiums. Professors Keaton and O'Connell announced at the time they made their original proposal they had failed to consult with or seek the advice of any claims man or trial attorney because they thought opinions from those sources would be biased and self-motivated. However, anyone who had some experience in dealing directly and face-to-face with injured claimants could have explained why the bills they were proposing would not have worked or accomplished the desired result.

At this point, I ask that we note the insurance companies' appeal from that part of the Massachusetts law calling for a reduction in premium and, at the instance of the companies, that provision was held unconstitutional, according to my information. It is also interesting to note that Governor Sargent in his address to the luncheon meeting of the Massachusetts Association of Independent Insurance Agents and Brokers said, in part:

"Inasmuch as most car owners carry the non-compulsory coverages, the cost of which may be four or more times the cost of bodily injury (no-fault) insurance, the net effect for many drivers has been to have a larger total auto insurance bill for 1971 than they had for 1970."

Many lawyers, I understand, are holding claims in Massachusetts pending final decision in the action that been filed attacking the constitutionality of the other part of the law adversely affecting injured people. And other claimants are assembling medical bills on their understanding the law requires them to do so to a total of \$500 before they are granted the rights they are entitled to under the act. It is to be anticipated that Massachusetts and/or insurance companies writing business in that state face more serious problems in the months to come.

Senator Hart's bill titled "Uniform Motor Vehicle Insurance Act" apparently has as its primary objective more of a spread of available insurance dollars among all people injured in an accident and secondarily, or hopefully, some reduction in insurance premiums. This is the bill under consideration in the United States Senate and my remarks will now be directed only to this bill without dwelling any further on the other plans having differing objectives, even though known by the same term—"no fault."

To take from one innocently injured that which he is entitled to at common law, in order to provide something for others who cause the accident, is wrong in its basic philosophy. It is also a fact, perhaps not known to the committee, that the people who are to have their rights taken from them are largely those people working in the trades and whose abilities to work depend upon their physical strength and who are not in the upper income bracket of our society. I feel quite certain that any study or survey made of the plaintiffs seeking damages in the various courts throughout the land would reveal this statement to be true. It is certainly true on my personal experience and that of my partners and all other lawyers with whom I have any personal contact. The reason is obvious. When we think of a man who lives in a \$40,000 home with three cars, one of which is for a child under 25, that individual feels that by his education and training, he is capable of handling his own claim. If he has one. He probably works at a desk job and sitting in an upholstered chair does not cause an injury to hurt him as it would the bricklayer or the carpenter or the auto mechanic. On the other hand, the man in the trades who suffers one of the injuries that may affect his working ability is quite concerned about his ability to continue to earn a living for his family and quite often is forced back to that laborious work by doctors who do not believe that any pain exists if it cannot be visually demonstrated. If the pending bill should accomplish the secondary purpose of reducing premiums, we would have the ironic fact established that we have taken away from the hard-working poor to reduce premiums for the rich who are paying high premiums for several cars, including one driven by a youngster.

All people involved in all of the accidents may be generally divided into two groups: those who are innocent and who are injured, and those others who are considered at fault in causing the accident. We should face the basic question directly and without evasive terminology and decide first which of those two

groups of people is society and most fair-minded men concerned about. If the question were posed that way, I suppose everyone would acknowledge more concern about the rights of the innocently injured than those who cause the accidents. It is on this point that those of us who work with the people who have been injured through no fault of their own cannot understand the proponents of the bill being proposed, since the bill takes from the innocent to give or provide for the guilty.

Having dealt with the people who were injured innocently for so many years, it follows that I have, of course, also dealt with those others against whom the claims are made—those who caused the accident. All of these people involved in accidents, both the innocent and those at fault, may also be divided into two general classes. There are those who have medical expense and wage loss benefits which they have either provided for themselves directly or have had provided for them by union contract, etc., and this group may generally be referred to as the responsible members of our society. The other group have not provided for themselves in such a manner nor do they work for employers who have so provided for them.

When we look at the provisions of the pending bill as applicable to those considered responsible, we see that those people would receive no benefits under this law unless they have what is termed catastrophic injury.

The proposed bill provides for a payment from this type of insurance only if the injured party does not have such benefits from other sources which, as seen, the responsible people do have. As to those people, how can a law that requires them to purchase and pay premiums for insurance that admittedly would pay them no benefits at all except for a harm termed "catastrophic," be justified?

Turning to the next question, would the average individual in that group of people who have no other health and accident benefits be particularly concerned about whether or not his doctors or the hospital were paid? As this point, it should be noted that despite some things we read, people who are injured and who do need medical attention are not denied such treatment because they have no money to pay for it. I have never known a hospital to refuse admittance to one brought to the emergency room by ambulance if such treatment was necessary because of the injuries then apparent. Follow-up care that is medically necessary is also available, perhaps not in the doctor's office but through the clinic; but, in any event, such treatment is rendered to those who need it by competent doctors. A check with hospitals and doctors generally would show that many such bills were incurred and written off unpaid when the injured party was unable to do so. Without unduly prolonging this subject, I hope the committee will accept my statement on my personal experience that such people who have no other insurance benefits usually are not particularly concerned with whether or not the doctor or hospital gets paid and when discussing settlement, the decisions are usually made by the injured people to settle or not according to how much would be paid to them from such a settlement. Thus, as to this group, we also see that they would not be particularly interested in the provisions of the proposed bill except that part that would pay them weekly indemnity, if they had been employed before they were injured and had no sick leave benefits, and such payments would mean only that they would not turn to welfare for assistance.

Along these lines, I think it can be fairly stated that except for what is termed catastrophic injuries, the benefits of the pending bill that would actually be paid would mean very little to those who are injured in accidents, whether at fault or not, but the doctors and hospitals would be pleased with these provisions. Again, it may be asked if denial of the rights of those who are innocently injured can be justified by referring to the benefits that would be paid to hospitals and doctors.

In any event, if it is indeed considered desirable to insist upon some coverage to protect economic losses sustained by the group who do not have other benefits, it would not be difficult or expensive to provide for such benefits in the existing policies. On this, I attach copy of the report and recommendations of the Committee of the Virginia Bar Association on Torts and Insurance, marked Appendix B. I also commend to the committee the report and recommendations of the special committee of the American College of Trial Lawyers on automobile accident reparations. We all know that simple med pay coverage is the very cheapest part of our policy even though such coverages pay on medical expenses without regard to whether such expenses are collectible from other sources. The insurance companies would probably oppose these recommendations broadening the scope of coverage because as we have seen, some of the

companies have as their objective limiting the coverage to practically no benefits for a 15% reduction of the existing premium. This involves a different subject but there is some question on the credibility of the companies' continuing statements of vast amount of "underwriting" losses. There is some question whether the statements are for the benefit of people who don't note the qualifying word "underwriting" before the word "loss." Whether the companies who make a great to-do about not writing new policies, such as Nationwide, is for the purpose of conditioning our legislators and the public to a change favorable to the industry is also a question. It can be noted that the insurance industry's magazine "Best" has reported the stock index of 18 fire and casualty companies have advanced 100% over the last 10 years—twice the 54% advance of Standard and Poor's index of 500 companies in industry generally. This should be sufficient answer to the companies when they do admit the profits they have made on investments and the insurance they write, but who say the return is not sufficient when the amount invested is considered.

The point is that on the complaints about unavailability of insurance, the companies cancelling, refusing to renew, ceasing to write new business, etc., those are problems very easily taken care of by state legislative action, if such is deemed advisable. The State of Virginia already has strict limitations on the company's right to cancel a policy and by the exercise of the same authority, the state can and has restricted the company's refusal to renew policies and to write new business. See Va. Code, § 38.1-381.5. It is the state that provides extra premium to be paid by those who have to go under assigned risk. The state has the authority to compel companies to write policies issued through the assigned risk and if the companies are making things difficult without justification, the state does not have to grant the company extra premium on those policies.

In any event, this sort of problem, to the extent it exists apparently in varying degrees throughout the different states, does not justify discarding our entire tort system that has existed for so long.

Secretary Volpe, Department of Transportation, has been quoted as resting his beliefs that the tort system should be changed upon his statement that it is not working well, in that some people obtain more than they should and others do not obtain as much as they should. That is acknowledged, since we have always said that our jury system is not perfect, but we have always added the admitted fact that it is the best system to resolve disputes between parties that has yet been devised. The same comments have been made concerning our political system and our system of free enterprise. If lack of perfection is to be considered a reason to abandon claims for damages by those injured without fault, then we should also abandon other parts of our system. Does the acknowledged fact that some guilty people are acquitted and some innocent people are found guilty in criminal court lead us to the conclusion we should abandon the system of criminal justice. Does the fact, equally acknowledged, that our lawmaking bodies from time to time pass bad laws and sometimes fail to pass good laws mean that we should abandon our system of government? Since admittedly, there is no perfection, the question is, are any defects in our present system of tort liability as great as would be the defects in the other system being proposed?

It has been said by some proponents of the so-called "no-fault" insurance that the question of who really was at fault cannot truly be answered. Again, we can admit there are some very few cases so close on liability that it is hard to tell whether the decision is truly right or not, but we who try cases have found that the juries are much better judges of such questions than anyone else or any other system. The fact is, however, that the overwhelming majority of cases do not cause any of the professionals in the business any problem. It is not hard to determine fault when one is shown to have disregarded a stop sign, hit another car in the rear, gone to the wrong side of the road, etc. A large part of the cases that go to trial are not really being tried on any question of liability but on a dispute between the parties on the cause, nature and extent of the injury and disability claimed.

Another point made by a proponent of the "no fault" system is that some of our courts have a large backlog where parties have to wait several years for a trial. Three of our large cities are usually mentioned in this connection. Such problems do not exist in Virginia and according to my colleagues I meet on the various seminars, they do not exist in most parts of the country. Solutions to the problems in those few large cities that have such problems have been suggested. Those of us who try cases generally cannot understand why in those few large cities it takes them longer to empanel a jury than it takes us to try an entire case to a conclusion here in Virginia. In any event, I would not think that any-

one would suggest that all of the tort laws and systems of civil justice throughout all of our states should be uprooted and innocent people denied their rights for the purpose of trying to solve problems largely of their own making in a very few of the large cities. Senator Hart has advised us that the Federal Judicial Center has pointed out motor accident litigation requires 11.4% of judge time in the Federal District Court and approximately 17% of the judge's time in state courts of general jurisdiction. I do not understand the significance of these figures. What about the flood of frivolous *habeas corpus* cases, creditor suits, etc.? Why should we say or suggest that the right of one who has suffered a disabling and painful injury is less important than the right of any other civil litigant?

The bill proposed would not alleviate any such problem because as indicated below, there are areas of built-in litigation in the proposed bill. On this subject, I would also refer the Committee to the letter of Chief Justice Tauro addressed to Governor Sargent of Massachusetts dated August 19, 1970, attached hereto, as Appendix C.

The bill introduced in the 91st Congress was changed and the one that now is under consideration defines "catastrophic harm" to mean that if one has less than a total disability, a permanent partial disability must be at least 70 per centum or more in order to have any rights preserved. I personally have never experienced a case of one having a disability less than total, but more than 70 per cent. I do know, however, that doctors are necessarily very imprecise in fixing percentages of disabilities and it is not unusual to have one doctor for the injured party testify to a larger per cent of disability and another doctor for the defense testify that the individual made a full and complete recovery with no disability. This approach is, in any event, fallacious.

The real question in any case is what the injury means to the individual, considering his work and other relevant factors. Consider a 45 year old truck-driver earning \$15,000 a year, who as a result of a neck injury is left with a limitation of motion to the extent he cannot pass the ICC medical requirements. Physically, he would have a small degree of physical disability that would not be very important to a lawyer or a senator, but to this truck driver, that injury would be disastrous. If this bill were to pay him anything, considering his union benefits for a limited time, such payments would not continue very long and then who could suggest to him what he should do. If he were innocently injured, we could explain this law to him, but he would find small comfort in the thought the medical expenses of the wrongdoer had been paid, if such were not payable from other sources.

On the other hand, suppose the lawyer or senator had a throat injury that resulted only in loss of speech. Again, a small degree of physical disability, but a disaster, in terms of enjoyment of life and ability to work at our calling.

It has been suggested the bill has many areas of potential litigation. Who decides when a man should be able to return to work—the insurance doctor or the treating physician? Who decides whether an injury or condition is due to an accident? Remember, we have already pointed out the fact that a large number of cases involve disputes, not on the question of fault, but on medical questions. I have no statistics, but I believe the Industrial Commission decides as many cases involving such questions as are filed in courts of general jurisdiction.

We have noted the "net economic loss" approach means that the responsible members of our society will be required to buy this insurance although, admittedly, they would be paid no benefits at all. The provision that Blue Cross or other hospitalization plans and sick leave plans can provide their benefits are supplemental to this bill gives us no comfort. The individual still recovers nothing—he has simply paid premiums for this coverage that is, by its express terms, for the benefit of other insurance he also paid for.

Upon reflection, it now appears this bill before Congress, as opposed to the one originally introduced, is very close or it fits exactly the plans desired by Travelers and Aetna. We know their motive and cannot really be surprised or upset at any company's desire to increase earnings. The people, however, should not expect our lawmaking bodies to further such profit motives at the expense of those who suffer injuries through no fault on their part.

Touching again very briefly on that subject of people waiting a long time for their benefits under the present system, I think any lawyer or claims man dealing on a day-to-day basis with claimants would confirm me when I state that in any case where there is merit to the claim, the claimant could obtain more benefits than are provided for by the proposed bill immediately and cheaply asking for them if that were all he wanted. I have already demonstrated that

ever, that those who are innocently injured conscientiously feel, and properly so, that they are entitled to compensation for pain, the inconvenience and other damages resulting from their injury and it is on their election that they wait until the doctor can give them some assurance as to what the future holds in store for them before bringing their case on to a conclusion. This again illustrates that those who are injured without fault on their part would be deeply distressed to lose what to them is a very important right after the fact of such an injury.

There is one more point that should be made as forcefully as possible. Going back to the view of Professors Keaton and O'Connell that opinions of professionals in the business are not reliable, I noted in the paper a short while ago that a gentleman from Illinois appeared before a Congressional committee expressing similar thoughts directed to all of our state legislators. I believe I have already demonstrated that I do not personally believe, on behalf of all the people who are injured without fault on their part, that any such law should be passed, either *state* or *federal*, taking away rights that to those in the lower economic status are most precious. In any event, that gentleman from Illinois was reported to have urged the Congress to take over not only the regulation of insurance, but to abolish and take over the rights to sue and be sued that are now the prerogative of the various states and their local courts. As a basis of his opinion, that gentleman from Illinois suggested to this Committee, it was reported, that all of the legislators throughout the states could not be counted on to do what he thought should be done. His reason for this was his statistics showing what percentage of the various legislative bodies consist of members of the Bar. Aside from the sheer arrogance of that suggestion that his individual wisdom was superior to the collective wisdom of all of the legislative bodies throughout the states, he ignored the fact that Congress likewise has a certain percentage of their members who are lawyers. I would hope that this Committee would not give any weight to the thought of one who suggests that all lawyers in our various legislative bodies, whether they are those few who are involved in the trial of tort actions or not, would make their decisions on various proposals opposed to what they conscientiously felt to be in the best interest of the people. Of course, there is no one who can claim perfection, but I would hope that most of us would recognize that whether a lawyer or not, our state legislators are conscientious men who are very close to their constituents and who will vote on any bill according to their true belief as to what is best for the people.

The New York Law Journal, April 26, 1971, p. 1, reports that a poll of New York trial judges shows 99 out of 100 opposed to "no fault" legislation and 80% favored arbitration of small claims. I would expect a study of trial judges throughout the land would show a similar result. If such a large percentage of our judges, our lawyers and, as the gentleman of Illinois says, all of our state legislators, oppose this type of legislation, I would expect that gentleman to reconsider his personal point of view. At least he should consider the possibility such men know more about the subject than he.

In closing, I would urge that the people we are concerned with be treated fairly. When statements are made that "claims" will be paid promptly and without regard to fault, they should be told in simple language that those are not claims as we know them today, but are claims that would result in payments to doctors and hospitals or there would be no claims paid at all to those who have other benefits against what is termed "economic loss."

Remember we are thinking of simple, hard-working and honest people who cannot always detect the true meaning of sophisticated phrases and who must trust our leaders to treat them fairly. On behalf of those people, who, if innocently injured would lose what to them are very precious rights, I ask that this committee make its report opposing this bill under consideration.

APPENDIX A

TRAVELERS POSITION ON THE AUTOMOBILE PROBLEM

Few subjects are generating more public and political comment than the present system of automobile insurance. And with good reason. It is based on a system of laws that are, in many cases, no longer appropriate in settling accident victim compensation. Claim settlements are too high for some, and too low for others. And, again because of the system, more dollars are spent on costs than should be in our view.

Automobile insurance rates are affected by many factors, among them: the number of automobiles on the road, highway design, the licensing of drivers,

automobile design, insurance competition and regulation, the laws concerning accidents, court decisions on compensation of accident victims, the costs of automobile repair and property replacement, and the system of insurance distribution.

Directly and through industry organizations we are working for improvement in many of these areas; for example, for better automobile and highway design, for stricter licensing requirements and better law enforcement. We are working for more open competition in setting insurance rates; for so-called file and use regulation. And, as quickly as laws permit, we are introducing mass merchandising—the system of selling automobile and other forms of insurance to individuals through their employers—as a means of lowering the costs of providing this insurance.

In addition, we are also working for changes in the laws governing automobile accidents and victim compensation on a state by state basis. We are supporting a modified “no-fault” automobile insurance plan. Our studies indicate that such a plan will allow us to lower rates on bodily injury insurance by approximately 15%.

Under the present system it is necessary to prove “fault” in an accident before a victim can be compensated. In some cases this is not possible, in others it means going to court. As a result, there are delays, some victims are not compensated at all, some are paid too little and others too much. Legal costs are sometimes high for both the accident victims and insurance companies.

The modified no-fault plan being supported by The Travelers would provide the following: a driver and his passengers who were in an accident would be compensated by his insurance company, without regard to fault, for up to \$2,000 in medical and surgical expenses, lost wages, or the cost of hiring replacement services while injured. Such benefits would be paid after the benefits of health and welfare, and salary continuance plans. Wages would be compensated at 85% of normal level, reflecting the tax laws.

There would be no delays, no basis for court action, and no need to prove fault in any case in which the loss to an individual was \$2,000 or less—a great percentage of cases at present. In cases in which there was loss of life, permanent disfigurement, dismemberment, permanent loss of a bodily function, or an economic loss to an individual of more than \$2,000, an accident victim would keep the full right to court action, and to compensation for pain and suffering.

We believe there is an urgent need for change in the present system of automobile insurance, and are supporting those changes that we believe are in the interest of Travelers customers, Travelers shareholders and the public.

VIRGINIA BAR ASSOCIATION COMMITTEE ON TORTS AND INSURANCE REPORT OF COMMITTEE ON TORTS INSURANCE

To: The Virginia Bar Association.

I. INTRODUCTION

This Committee was appointed as a new Committee by President F. Waller Dudley, free to seek its own area of study within its framework of torts and insurance; however, it became apparent to the members of the Committee even before they met that the most pressing issue in the field of “Torts and Insurance” was that posed by the various “No Fault” proposals being made before the United States Congress and the various State Legislatures; and that we could find no more worthwhile undertaking than to study this issue with a view to making recommendations to the Executive Committee and membership of the Virginia Bar Association with respect thereto. The Committee, at its first meeting, proposed to:

Make a thorough study of the subject of automobile accident reparations and seek to make recommendations to the Executive Committee and the membership of the Virginia Bar Association for consideration and, hopefully, adoption at the Annual Meeting at the Greenbriar on July 9, 1971.

The Committee's decision was clearly ambitious because of the great influx in recent years of proposals for automobile compensation plans. Five years ago, the Keaton-O'Connell “Basic Protection Plan” was being advocated but, since that time, more than a dozen alternative plans have been brought forward publicly. The sheer number and varying complexity of the plans made it virtually impossible to analyze and evaluate all of the various plans. Therefore, the

Committee sought to study the principal ones (including the "Massachusetts Plan" enacted in 1970, the "New York Stewart Plan", and those embraced in the bills introduced in the 91st Congress by Senator Hart) and the more comprehensive reports on the subject, with special reference to the report of the American Bar Association's Special Committee on Automobile Accident Reparations. Recently, the Committee membership received the report of the American College of Trial Lawyers on "Automobile Accident Reparation", which was felt to be one of the best.

The Committee met on three occasions: on October 30, 1970 in Richmond; on January 22, 1971 in Williamsburg, and on March 27th, 1971 in Richmond. The Committee has had spokesmen from the insurance industry appear before it in advocacy of and in opposition to the "No Fault" concept. Mr. Richard W. Galiher, Regional Representative for the American Bar Association, appeared before the Committee and explained the American Bar Association Report. Also, on invitation of the Committee, the 'Defense Council of Virginia,' the Virginia Bar Committee on "Basic Protection" and the Virginia Trial Lawyers Association sent a representative to our Committee meetings, and they made a substantial contribution to our efforts.

From the beginning, the Committee was of the opinion that lawyers and, in particular, the trial Bar, have a key role to play in public consideration of the issues proposed by these various insurance plans, whatever may be their individual views on the subject. The daily contact that trial lawyers have with automobile accident claims places them in a position to bring unique knowledge and experience to any discussion of these issues. In the Committee's view the fact that the Bar might have an economic interest in the matter should not disqualify it from taking an active role; but, after open-minded consideration of all recent proposals, should make its recommendation to legislators and the public on the basis of what mode of automobile reparations would best serve the public interest.

II. RESULTS OF STUDY—OPINIONS AND CONCLUSIONS

A. Problems within the present system

Chief complaints against the present system of auto reparations: (1) The high cost of insurance; (2) Unavailability of insurance; (3) Failure of many who suffer injury or loss to receive compensation.

1. The Committee is not convinced that the "No Fault" plans can offer a reduction in insurance premiums. These plans propose to compensate everyone suffering automobile injury for economic loss regardless of fault, economic loss being defined principally as medical bills and loss of income. To try to keep costs within acceptable limits, the "No Fault" plans propose to limit the benefits available to all victims, including those not at fault, in order to compensate those who are at fault. The United States Department of Transportation has stated that approximately forty percent (40%) of the people injured in automobile accidents recover nothing and that their collective economic loss approximates three billion dollars a year. Unless the benefits now being received by those not at fault are substantially reduced by virtue of the above mentioned limitations, payment of those allegedly not now being compensated must, of necessity, cause substantial increase in the overall cost of insurance.

Some plans adopt a two-level approach which abolishes the fault rule within the prescribed limits of loss/benefits but permit the tort action to stay alive if losses exceed this level or limit. The "Massachusetts Plan", for example, is of this structure in that it provides minimum "No Fault" benefits, but permits tort actions where the economic loss exceeds a certain sum. It is difficult to see how this could possibly reduce present insurance costs.

In addition, none of the "No Fault" plans purports to compensate for the cost of property damage to motor vehicles. Yet, property damage accounts for approximately two-thirds of the automobile insurance premiums paid today (California Commission Report). If such losses remain subject to the present system of recovery, no improvement in insurance cost can possibly be foreseen in this area.

2. The Committee feels that the Insurance Commission should act promptly on requests for rate increases to enhance availability of voluntary coverage. There was not sufficient time for the Committee to study the limited results and implications of "Open Competition", under which insurance companies are free to set their own rates. Insurance companies, although subject to regulation,

do not have a monopoly, as to public utilities and it may be that free competition would keep rates within reasonable bounds. The Committee feels that the "Open Competition" approach should be further studied for possible adoption for Virginia.

8. The American Bar Association Report and the report of the American College of Trial Lawyers both recommend that the "gaps" in our present system of compensation be reduced by adoption of a comparative negligence doctrine, abolition of the doctrine of gross negligence, and the elimination of the various charitable and governmental immunities. This Committee is not ready to recommend adoption of such proposals for fear that they might have an adverse effect on insurance premiums, but we recommend that they be further studied in detail.

The Committee does feel that the standard automobile policy in Virginia should contain mandatory medical pay and loss of income provisions. This would guarantee to everyone, regardless of fault, certain minimum benefits at little additional cost. These costs could be minimized by a change in the law of recoverable damages so as to automatically deduct the amount of monies recovered under these policy provisions from any recovery that may be effected by the injured party in an adversary claim.

B. The committee is philosophically opposed to the adoption of the "No Fault" plans being advocated

Information presented to the Committee indicated that the various "No Fault" plans would cost more (not less) than present insurance, or would substantially lower the benefits to which the innocent accident victim is now entitled. In the absence of significant offsetting advantage, we perceive no reason why the automobile accident victim should be singled out as entitled to less in damages for his injuries than those injured by some other means. The "Federal Employees Liability Act" applicable to railroad workers and the "Seamens Act" applicable to seamen, remain in effect, and there seems to be no movement to favor abolishing them in favor of some system of limited recovery. We feel that the automobile accident victim is as deserving of adequate recompense as is the railroad worker, the seaman, or other accident victims of our society.

Most of the "No Fault" proposals would take away the right of the accident victim, innocent or guilty, to collect for disability or pain and suffering. These are natural and proper bases of recovery and should not be prohibited without greater alternative benefit than the known "No Fault" plans would offer.

Finally, we believe that the established rules of tort law still have a valid place in our society, and that the public should not surrender lightly the principle of personal responsibility in automobile cases.

C. Highway Safety and Improved Automobile Design

The Committee feels that the Bar Association should work assiduously to strengthen laws that will tend to increase highway safety. For example, we felt that the Virginia Drunk Driving Laws are, in many ways, impracticable and difficult to enforce and have substantially reduced convictions of drunken drivers. Yet, there seems to be general agreement that alcohol is a factor in at least fifty percent (50%) of traffic fatalities. The recent increase in drug use constitutes a significant addition to the problem.

That strong sanctions, strictly enforced, do bring results, has been clearly established. The British adopted severe sanctions for drunk driving as a means of accident control and highway accidents were drastically reduced. Arkansas enacted a system of strict enforcement of drunk driver laws and there has been a corresponding reduction in traffic fatalities. Chicago had adopted a law providing mandatory jail sentences and suspension of license for one year for conviction under the influence; and, during the period of December 18, 1970 to January 8, 1971, highway fatalities were reduced by nearly two thirds. The positive impact of such measures on the problem of accident reparations is obvious. Our continuing and increased concern in this area is our public and professional obligation.

We were greatly impressed by the data offered by Company spokesmen indicative of the truly significant insurance savings that could be effectuated through improvement of car design for greater impact resistance and ease and economy of repair. Although this approach has less human appeal than the question of highway safety, its potential effect upon the problems of insurance coverage should not be underestimated.

III. RECOMMENDATIONS.

The Committee recommends the following :

1. That all motorists in Virginia be required to carry insurance in addition to that now required by the statutes of Virginia, that would provide \$1,000 medical pay benefits and disability payments of \$60 per week for a maximum of 20 weeks. It was estimated that this coverage would cost \$17.00;

2. That any amount paid pursuant to the terms of such mandatory coverage be deducted from the amount of any settlement or judgment which the injured party might obtain in an adversary proceeding;

3. That automobiles be designed to give the maximum safety to the occupants and automobile bumpers be designed so that property damage resulting to the automobile from relatively minor collisions would be eliminated or materially reduced, that to further this aim, legislation similar to Senate Bill No. 900, which has been passed by the legislature of Florida be passed by the legislature of Virginia. A copy of said Senate bill No. 900 is attached.

Allstate Insurance Company has stated publicly that they will reduce property damage premiums 20% upon enactment of this bill;

4. That continuing efforts should be made to improve highway safety and, in particular, promote laws and law enforcement to restrict the drunken driver;

5. That further study should be given as to whether allowing insurance companies to sell insurance on a competitive basis rather than have their rates regulated would result in reducing the costs of insurance and making it available to more people;

6. That every effort should be made to inform the public of the advantages of the present system over the proposed "No Fault" system and this Committee should request that the State Bar Association allocate funds that can be used for this purpose.

Respectfully submitted,

Breeden, III, Douglas K. Frith, Robert G. Coleburn, Archibald A. Campbell, W. H. Jolly, Henry H. McVey, III, Wilbur C. Allen, *Chairman*.

CHAPTER 70-420

SENATE BILL NO. 900

AN ACT relating to private passenger automobiles; defining "private passenger automobile;" creating a manufacturer's warranty as to standards of safety concerning the ability to sustain shock; providing, in lieu of the warranty, certification by the manufacturer of compliance with the energy absorption standards provided; providing an effective date

Be it Enacted by the Legislature of the State of Florida:

Definitions; warranty on sale and manufacture of automobiles; energy absorption system.—

Section 1. For the purposes of this act, the term "private passenger automobile" shall mean a four-wheeled motor vehicle designed principally for carrying passengers not for hire, for use on public roads and highways, and not designed for use principally as a dwelling or for camping.

Section 2. Every private passenger automobile manufactured on and after January 1, 1973, sold and licensed in the state of Florida, shall be sold subject to the manufacturer's warranty that it is equipped with an appropriate energy absorption system and that, without compromising existing standards of passenger safety, it can be driven, both front and rear, directly into a standard Society of Automotive Engineers (SAE J-850) test barrier at a speed of five (5) miles per hour without sustaining any damage to the automobile.

Section 3. Every private passenger automobile manufactured on and after January 1, 1975, sold and licensed in the State of Florida, shall be sold subject to the manufacturer's warranty that it is equipped with an appropriate energy absorption system and that, without compromising existing standards of passenger safety, it can be driven, both front and rear, directly into a standard Society of Automotive Engineers (SAE J-850) test barrier at a speed of ten (10) miles per hour without sustaining any damage to the automobile.

Section 4. The warranty provisions of this act shall not be applicable with respect to any private passenger automobile as to which the manufacturer files a written certification under oath with the Department of Motor Vehicles and Public Safety, on a form to be prescribed by that Department, that the particular make and model described therein complies with the applicable standards of this act.

Section 5. This act shall become effective on July 1, 1970.

Became a law without the Governor's approval.

Filed in Office Secretary of State July 8, 1970.

APPENDIX C

COMMONWEALTH OF MASSACHUSETTS,

THE SUPERIOR COURT,

Boston, Mass., August 19, 1970.

HON. FRANCIS W. SARGENT,
Governor of the Commonwealth
State House
Boston, Mass.

DEAR GOVERNOR SARGENT. Since my most recent letter to you regarding the need for additional Superior Court justices, it has come to my attention that some opponents of legislation to enlarge the Superior Court contend that the recently enacted "no fault" insurance plan eliminates the need for additional Superior Court judges by doing away with a substantial portion of their workload. Unfortunately, nothing could be further from the truth.

Although the volume of automobile tort suits entered in the Superior Court is large in comparison to other types of entries, the fact is that proportionately few of them are ever tried. Consequently, they consume very little Superior Court judges' time. The minor cases remanded to the district and municipal courts and most of the remaining automobile cases are settled out of court.

A thoroughly documented study in 1968 revealed that only 13% of Superior Court judges' time in Suffolk County was devoted to the trial of automobile tort cases.

The major share of the court's time is used in processing serious criminal cases, land damage, zoning, equity, contract, products liability and medical malpractice suits, appellate review of administrative agencies such as licensing agencies, the Industrial Accident Board and the Civil Service Commission, petitions for extraordinary writs, commitments of narcotic addicts and sexually dangerous persons. *The "no fault" plan will have no effect whatsoever on these cases. [Emphasis added]*

Furthermore, the "no fault" plan applies only to relatively minor claims. These cases are customarily remanded to the district courts and only a minute percentage are ever appealed to and retried in the Superior Court. Their elimination from the judicial process will, therefore, have very little effect on the Superior Court. The more serious automobile tort cases will continue to require a Superior Court trial even under the "no fault" plan.

The Superior Court's workload may well be increased by Superior Court litigation involving the administration and application of the "no fault" plan.

The most critical problem confronting the Superior Court is not motor vehicle tort litigation but rather its spiraling criminal caseload and a constant increase in civil litigation. In no way will the enactment of the "no fault" insurance plan affect this problem. We simply do not have sufficient Superior Court judges to process with fairness, dignity and efficiency our caseload. The unconscionable accumulation of untried cases, civil as well as criminal, clearly demonstrates the need for additional Superior Court judges now. I fully concur with Chief Justice Burger's recent remarks to the American Bar Association in St. Louis:

"If ever the law is to have genuine deterrent effect on the criminal conduct giving us immediate concern, we must make some drastic changes. The most simple and obvious remedy is to give the courts the manpower and tools—including the prosecutors and defense lawyers—to try criminal cases within 60 days after indictment. I predict it would sharply reduce the crime rate." [Emphasis added]

In short, I do not believe that the supporters of the "no fault" insurance plan can at this time properly list as one of its features a significant reduction in the business of the Superior Court. It is my considered judgment that the enactment of legislation which would give the court much needed help will

an untried theory and unproven facts would further jeopardize the ability of the Superior Court to effectively administer justice.

G. JOSEPH TAUBO.

Senator HART. Next we will have the testimony reflecting the view of the Independent Mutual Insurance Agents Association of New York, New Jersey, and Connecticut, from the chairman of its national affairs committee, Mr. Charles L. Rue, Jr.

STATEMENT OF CHARLES L. RUE, JR., CPCU, CHAIRMAN, NATIONAL AFFAIRS COMMITTEE, INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATION OF NEW YORK, NEW JERSEY, AND CONNECTICUT, TRENTON, N.J.; ACCOMPANIED BY ERIK A. NICOLAYSEN III, CPCU, PRESIDENT, ERIK A. NICOLAYSEN, INC., CHAPPAQUA, N.Y.; JOHN S. BRADY, PRESIDENT, WEBSTER'S INSURANCE SERVICE, INC., WATERBURY, CONN.; AND IRVING B. MICKEY, DIRECTOR OF COMMUNICATIONS, INDEPENDENT MUTUAL INSURANCE AGENTS, GLENMONT, N.Y.

Mr. RUE. Thank you, Mr. Chairman.

I am Charles L. Rue, CPCU, from Trenton, N.J. I would like to introduce to you, if I may, some of my companions here this morning.

On my right, Mr. Erik A. Nicolaysen, CPCU from Chappaqua, N.Y. On my left, Mr. John S. Brady, Waterbury, Conn. Both of these gentlemen have been on our auto study committee since 1968.

I also have with me Mr. Irving B. Mickey, director of communications for our association headquarters in Glenmont, N.Y.

Our three States, Mr. Chairman, represent about 3,500 agencies and 10,000 individual agents. Our three States serve approximately 5 million insured persons. I am serving currently as chairman of the three-States national affairs committee.

The objectives of our testimony today are twofold. One, to express our basic philosophy on the subject of automobile accident reparations reform and the related subjects encompassed by S. 945, S. 946, and S. 976, and, two, to comment on the few specific portions of these bills to which we object or which raise serious questions in our minds—I might add that these are relatively few because, by and large, we are very favorably disposed toward the objectives of this package of legislation.

First, on S. 945.

Our three associations, both individually and collectively, strongly support the concept of a first-party automobile accident reparations system and, in keeping with that philosophy, we will actively support any measure which represents a reasonable evolutionary step in that direction.

This position stems from an intensive study of accident reparation problems conducted by our three-State automobile study committee in 1968, the findings of which were published in the fall of that year.

We have appended a copy of that report to the official copies of this document. We will simply summarize our findings. I will not go through our objections to the tort system. They have already been eliminated by many other witnesses. Neither will I read the advantages of the first-party system since you are familiar with those.

Senator HART. Mr. Rue, the statement will be printed in the record in full, and the 1968 study which was a part of it will be printed also.

Mr. RUE. I would like to comment, however, on a primary versus secondary coverage.

On one point we take a very strong position. We believe that automobile insurance should occupy the primary coverage position in the settlement of any and all claims arising from automobile accidents. Conversely, it should not be placed in a position secondary to collateral coverages held by the insured.

We base this reasoning upon the following four points:

(a) Persons carrying valid automobile insurance who are injured in automobile accidents should not be required to exhaust benefits which they have accrued to protect themselves against natural illness or other mishaps.

(b) Administrative confusion resulting from a secondary coverage system would be monumental. It would be virtually impossible to devise a comprehensive rating system for automobile insurance which would mesh with the staggering number of accidents, health, medical and income protection plans offered through other sectors of the insurance industry.

Furthermore, shifting administrative costs of processing bodily injury claims to hospitalization insurers would not greatly reduce the administrative burden on the auto insurer since any accident causing significant injury will undoubtedly be accompanied by a considerable degree of property damage. Hence, the auto insurer is already in the act, and the additional administrative cost of processing the injury portion of the claim would be negligible.

(c) The economic cost of highway accidents should be borne entirely by highway users. Yet, a secondary coverage statute, while undoubtedly effecting some savings in automobile insurance premium, would simply shift the burden of highway economic losses to the rest of the public in the form of higher premiums for other hospitalization and/or medical insurance.

Needless to say, the accident and health insurers would probably respond quickly by excluding automobile accident losses from their own coverage, thus further muddying the waters.

(d) People buy automobile insurance to protect themselves against losses suffered in automobile accidents and that insurance alone should protect them fully against all such losses, except where covered by workmen's compensation.

Our position on S. 945;

With few exceptions, S. 945 is a major step toward our own ultimate goal. It is a farsighted measure which provides for virtually every contingency that might arise under such a system, and we commend you, Mr. Chairman, and your committee, for the research and the thought which went into its preparation.

However, we do object to and/or question the following four provisions of this bill:

(1) Section 2(12)(A), by definition of "net economic loss," places automobile insurance in a secondary position to collateral coverages, this is totally unacceptable to our associations for the reasons outlined immediately above and constitutes our principal objection to the bill as presently worded,

(2) Section 3 virtually mandates compulsory automobile insurance on a nationwide basis. While the concept has definite merit, particularly in the eyes of responsible citizens, we must question its enforceability.

Even in such States as New York, one of the pioneers in strict, compulsory automobile insurance, a significant number of uninsured drivers still find access to the highways.

Furthermore, to be totally objective, the responsible person would almost unquestionably insure himself, with or without a compulsory insurance law, and the person so irresponsible as to drive without coverage doesn't belong on the road at all.

Section 5(d) (1), in conjunction with section 5(a) (3) (B), provides virtually all of the protections for the insurance industry which we have repeatedly asked for in testimony before State legislative and/or insurance department hearing commission. We are most grateful for this.

We do, however, raise one point for your serious consideration. With the noted exclusions, all of which are subject to punitive action, this section of the bill is virtually a lifetime mandatory issue, guaranteed renewal and noncancellation provision.

The intent sounds fine—and I might add that our associations, in their own States, have been in the front lines of the battle to stop frivolous cancellation, nonrenewals and refusals to insure good risks. These are just as much a threat to our own livelihood as they are to the public.

But section 5(d) (1) of this bill represents overkill. There are many risks—the perpetual “fender-benders,” for example, who are not subject to punitive action yet who cause enormous losses for insurance companies, losses ultimately passed on to the entire insured public.

This provision makes it mandatory for an insurer to cover these people for life.

True, the next subsection, section 5(d) (2), exempts an insurer who is facing insolvency. But can we legitimately force a private business to accept, without time limitation, business which will ultimately drive it into bankruptcy?

We question the constitutionality of such a requirement and, therefore, oppose this section of the bill as presently worded. We suggest instead a clause of similar intent but with a statutory limitation of perhaps 3 to 5 years, after which the insurance company, upon presentation of reasonable supporting evidence, could elect to discontinue coverage.

4. Section 7(a) would establish, at State level, an assigned claims plan. The objective is obvious and basically sound—namely, to deal with contingencies not otherwise covered in the basic law.

However, we do wish to point out that this provision will require the establishment of 50 new State agencies—or some lesser number, supplemented by a sizable new Federal agency—all of which will cost a considerable amount of money to operate.

Unfortunately we can offer no constructive alternative. But we do suggest that this mechanism be analyzed very carefully before implementation, with an eye toward making the basic law so comprehensive that the rare contingency can be handled within the framework of existing agencies, at little or no extra cost to or subsidy by the public.

In short, if S. 945 were amended to place the automobile insurance

in a primary coverage position and to soften the overly stringent mandatory issue requirements, we would view it as a model piece of legislation and support it enthusiastically.

SOME COMMENTS ON S. 946

To place our comments in proper perspective, we are compelled to open our discussion of S. 946 with a brief question of semantics.

This bill, as presently worded, deals only with group insurance. We wonder if that limitation is truly the intent of the sponsors. Group insuring is actually one of several types of marketing techniques commonly lumped together under the more general heading of "mass marketing." "Franchise" and "collective" marketing are other examples of the broad category.

Since our position on mass marketing is already clearly defined, and since the term encompasses group insurance, we will discuss S. 946 in the context of the broader terminology.

Our associations, individually, and collectively, are firmly committed to the principle of reasonable regulation of mass marketing. In fact, we actually originated the bills which led to a mass-marketing-guidelines statute in Connecticut and insurance department regulatory guidelines in New York State.

Before going any further, let me make one thing abundantly clear—despite some accusations to the contrary, our goal most assuredly is not to kill mass marketing—group insuring, if you prefer—or even to impede it. Quite to the contrary, we recognize it as a viable, modern sales technique which can bring significant savings to the insured public.

Furthermore—from a purely selfish standpoint—several of our own members have already acquired sizable mass marketing accounts, and many others are seeking a piece of that same action.

But, make no mistake—uncontrolled mass marketing invites a number of abuses which could prove highly detrimental to the insured public. In our estimation, the following five pose the greatest immediate threat:

1. General application of discriminatory underwriting practices whereby an insurer underwrites only those members of a group who, in that insurer's estimation, constitute the best risks. This is the practice commonly known as "cream skimming."

2. Arbitrary cancellation or nonrenewal of policies already issued to members of the group, leaving the victims to seek replacement coverage in an increasingly restricted marketplace. This is probably even more insidious than initial rejection.

3. Selective underwriting practices, which would deny coverage to youthful drivers, drivers over 65 years of age, certain ethnic minorities, inner-city property owners and similar groupings.

4. Failure to provide continuity of coverage to those persons leaving an insured group, for whatever the reason.

5. Unless completely separate recordkeeping is mandated and rating for each group based upon the experience of that group alone, the rest of the insured public could find itself subsidizing any group losses which might occur. These records, needless to say, should include a complete breakdown of management expenses at all levels to prevent

parent insurance companies from disguising in their own records, and passing along to their own clients, losses deliberately incurred through underpricing by subsidiary or "pup" companies.

Gentlemen, this is not just alarmism. These things do happen, and we are very slowly but very surely gathering examples. Without some safeguards the end result could be the creation of a very large and relatively uninsurable residual market comprised of group rejects and other people not fortunate enough to be insured through group or other mass-marketed plans. Many of these could hope for little more than assignment to high-cost assigned risk pools.

We think that the key to effective control lies in two words: "Guaranteed issue"—in other words, the requirement that an insurance company offering a group plan accept all eligible members of the group, without resorting to the discriminatory underwriting practices which we just outlined.

I will come back to this point in a minute.

S. 946 contains elements which we find both pleasantly surprising and paradoxical. Section 3 clearly conveys the intent of the measure—namely, to prohibit overly restrictive controls which would impede the natural evolution of group or other forms of mass marketing. Yet section 2(2) begins to approach the very guaranteed-issue requirement for which we have fought so vigorously in our own States. We view this as a major step in the right direction.

In fact, we respectfully suggest that with the addition of the following items, S. 946 would approach our own concept of a model mass marketing guidelines bill:

(1) A provision prohibiting compulsory participation in a group insurance plan as a condition of employment or group membership—in other words, protecting the group member from coercion by an employer or other group sponsor.

(2) A requirement that a person leaving the group, for whatever reason, be granted the privilege of continuing his coverage for a reasonable length of time or of converting it to a higher policy with the same insurer.

(3) The addition of the following exclusions to the guaranteed issue provision:

(a) Failure to pay premiums.

(b) Fraud or misrepresentation in the application for insurance.

(c) Termination of the group.

(d) Also, conviction within the previous 3 years of:

(1) Operating a motor vehicle while intoxicated or under the influence of drugs.

(2) Leaving the scene of an accident.

(3) Use of a motor vehicle in committing a felony.

(4) Operating a motor vehicle with the specific intent of causing injury or damage.

(5) Making false statements in the application for a motor vehicle operator's license.

(6) Operating a motor vehicle while the operator's license is suspended or revoked.

Please note that these exclusions are an extension of and completely in context with those granted in S. 945. They simply provide reasonable protection to the group insurer against the criminals, chronic of-

in a primary coverage position and to soften the overly stringent mandatory issue requirements, we would view it as a model piece of legislation and support it enthusiastically.

SOME COMMENTS ON S. 946

To place our comments in proper perspective, we are compelled to open our discussion of S. 946 with a brief question of semantics.

SOME COMMENTS ON S. 946

To place our comments in proper perspective, we are compelled to open our discussion of S. 946 with a brief question of semantics.

This bill, as presently worded, deals only with group insurance. We wonder if that limitation is truly the intent of the sponsors. Group insuring is actually one of several types of marketing techniques commonly lumped together under the more general heading of "mass marketing." "Franchise" and "collective" marketing are other examples of the broad category.

Since our position on mass marketing is already clearly defined, and since the term encompasses group insurance, we will discuss S. 946 in the context of the broader terminology.

Our associations, individually, and collectively, are firmly committed to the principle of reasonable regulation of mass marketing. In fact, we actually originated the bills which led to a mass-marketing-guidelines statute in Connecticut and insurance department regulatory guidelines in New York State.

Before going any further, let me make one thing abundantly clear—despite some accusations to the contrary, our goal most assuredly is not to kill mass marketing—group insuring, if you prefer—or even to impede it. Quite to the contrary, we recognize it as a viable, modern sales technique which can bring significant savings to the insured public.

Furthermore—from a purely selfish standpoint—several of our own members have already acquired sizable mass marketing accounts, and many others are seeking a piece of that same action.

But, make no mistake—uncontrolled mass marketing invites a number of abuses which could prove highly detrimental to the insured public. In our estimation, the following five pose the greatest immediate threat:

1. General application of discriminatory underwriting practices whereby an insurer underwrites only those members of a group who, in that insurer's estimation, constitute the best risks. This is the practice commonly known as "cream skimming."

2. Arbitrary cancellation or nonrenewal of policies already issued to members of the group, leaving the victims to seek replacement coverage in an increasingly restricted marketplace. This is probably even more insidious than initial rejection.

3. Selective underwriting practices, which would deny coverage to youthful drivers, drivers over 65 years of age, certain ethnic minorities, inner-city property owners and similar groupings.

4. Failure to provide continuity of coverage to those persons leaving an insured group, for whatever the reason.

5. Unless completely separate recordkeeping is mandated and rating for each group based upon the experience of that group alone, the rest of the insured public could find itself subsidizing any group losses which might occur. These records, needless to say, should include a complete breakdown of management expenses at all levels to prevent

parent insurance companies from disguising in their own records, and passing along to their own clients, losses deliberately incurred through underpricing by subsidiary or "pup" companies.

Gentlemen, this is not just alarmism. These things do happen, and we are very slowly but very surely gathering examples. Without some safeguards the end result could be the creation of a very large and relatively uninsurable residual market comprised of group rejects and other people not fortunate enough to be insured through group or other mass-marketed plans. Many of these could hope for little more than assignment to high-cost assigned risk pools.

We think that the key to effective control lies in two words: "Guaranteed issue"—in other words, the requirement that an insurance company offering a group plan accept all eligible members of the group, without resorting to the discriminatory underwriting practices which we just outlined.

I will come back to this point in a minute.

S. 946 contains elements which we find both pleasantly surprising and paradoxical. Section 3 clearly conveys the intent of the measure—namely, to prohibit overly restrictive controls which would impede the natural evolution of group or other forms of mass marketing. Yet section 2(2) begins to approach the very guaranteed-issue requirement for which we have fought so vigorously in our own States. We view this as a major step in the right direction.

In fact, we respectfully suggest that with the addition of the following items, S. 946 would approach our own concept of a model mass marketing guidelines bill:

(1) A provision prohibiting compulsory participation in a group insurance plan as a condition of employment or group membership—in other words, protecting the group member from coercion by an employer or other group sponsor.

(2) A requirement that a person leaving the group, for whatever reason, be granted the privilege of continuing his coverage for a reasonable length of time or of converting it to a higher policy with the same insurer.

(3) The addition of the following exclusions to the guaranteed issue provision:

(a) Failure to pay premiums.

(b) Fraud or misrepresentation in the application for insurance.

(c) Termination of the group.

(d) Also, conviction within the previous 3 years of:

(1) Operating a motor vehicle while intoxicated or under the influence of drugs.

(2) Leaving the scene of an accident.

(3) Use of a motor vehicle in committing a felony.

(4) Operating a motor vehicle with the specific intent of causing injury or damage.

(5) Making false statements in the application for a motor vehicle operator's license.

(6) Operating a motor vehicle while the operator's license is suspended or revoked.

Please note that these exclusions are an extension of and completely in context with those granted in S. 945. They simply provide reasonable protection to the group insurer against the criminals, chronic of-

fenders, and other such risks which would not be insurable under any normal circumstances in the regular voluntary market.

Our only specific objection to S. 946 involves section 5. We believe that actual regulation of group and other forms of mass-marketed insurance should be retained at State level and, in keeping with this, that jurisdiction over violations should rest with State insurance commissioners and State courts rather than the Federal Government.

On S. 976 we have really only one comment. This bill lacks just one closing word: "Amen."

I would like to comment on our thoughts on State versus Federal jurisdiction. We would like to close this testimony with a brief statement of our position relative to the question of State versus Federal regulation of automobile insurance.

Please be advised that we are firmly committed to the principle of State regulation and control of insurance activities, within the context of Public Law 15 of 1945, the so-called McCarran Act.

This does not infer in any way that the Federal Government could not perform competently in this area. Furthermore, the concept of federally mandated standardization of automobile accident reparations laws possesses great merit.

However, we believe that continuation of State regulation and control offers three overwhelming advantages:

(1) Automobile accident problems and associated insurance problems have a definite regional flavor. They are directly influenced by population density, vehicle density, occupational pursuits of the area, weather patterns and similar factors.

Stated another way, you cannot compare insuring conditions in New York City with those of a Kansas farm community. Hence, we believe that regional or State regulation is simply more practical and would be more responsive to local needs.

(2) The State regulatory mechanism already exists and, for the most part, we believe it has been effective. Furthermore, it will continue to exist even if the Federal Government assumes jurisdiction over automobile insurance, because automobile insurance, after all, is only one area of a vast insurance picture. Why not utilize these existing facilities?

(3) Assumption of jurisdiction over automobile insurance by the Federal Government would require the establishment of a fairly large and highly complex new Federal agency. This would be a costly operation and the public would ultimately pay for it in the form of higher insurance premiums and/or higher taxes.

For disturbing implications of what could lie ahead, we need point only to those portions of S. 945 which call for the establishment of new agencies and appropriation of public funds.

Now—criticism is worthless unless constructive, and we do have a constructive suggestion. If S. 945 and S. 946 are indeed passed into law—and, remember that we would support them readily with the revisions noted above—then pass them in the form of standardized guidelines for implementation at State level, giving the States a reasonable period of time to do so.

The new crime insurance law provides ample precedent for such a course of action and we are convinced that it is the most practical and economical approach.

Thank you for permitting us to testify today. We hope that our suggestions will be of some value to you and that the outcome of these hearings will be a positive move in the direction of realistic and long-overdue automobile reparation reform. The public has waited too long.

Senator HART. Mr. Rue and gentlemen, thank you for a statement that I think reflects careful analysis of the proposals and a conclusion that is very clearly stated. In addition, thank you for the suggestions as to some changes that you would urge be made in our proposals here. I must confess when I saw the witness list this morning I did not anticipate this kind of endorsement of the legislation; and it becomes ever more persuasive.

Just one question from me. Where you say "amen" to the Motor Vehicle Information Act—and we thank you for that—the very last point you make in that section, to stay with this and the public will join you in this kind of expression "when they see the impact on their automobile insurance rates." I have felt that design and inspection of vehicles and repairability standards would permit the lowering of insurance rates. You make the same point, but this has been challenged. Are you satisfied that rates would go down?

Mr. RUE. Yes, I am. We already have one company which has publicly advertised quite widely that in fact they will automatically reduce rates on one item alone, the creation of a bumper that will withstand a reasonable bump, and this is but one item that is involved in the total automobile. It would seem to me to be an almost inevitable result of a more stringent construction regulation.

Senator HART. Senator Stevens.

Senator STEVENS. You make some comments about the assigned claims plan apart from the problems that you outlined in terms of proliferation of new agencies. Do you have any further comments concerning this proposal, and could you be more specific in terms of your suggestion that it needs to be done but cautiously?

Mr. NICOLAYSEN. Our feeling on the assigned claims plan is primarily with the no-fault concept self-motivation would bring about a much higher load carrying factor and considerably more people would buy it in the States where it is not compulsory. Therefore, the only time that we would be dealing under the assigned claims procedure is basically where we are dealing with a drunk driver or a few things like that, where conceivably through the existing mechanism coverage is not being provided.

We feel though as a practical matter that a large majority of the people will have it and as a result there is no need for a large proliferation of additional functions. We feel that the number of people who have them who would be falling in this category would be rather slim, and merely assigning the claims away through the companies it could be handled through the existing mechanism.

Senator STEVENS. Are you saying there is no need for the organization of an assigned claims bureau in each State?

Mr. NICOLAYSEN. No, we feel it could be handled on a rotation basis of the few categories that it would fall into after everything was taken care of. It could be handled by merely rotating it from one company to the next on a pass-around basis.

Senator STEVENS. I do not understand your answer.

MR. NICOLAYSEN. We feel that the existing mechanism can handle the thing without an additional Federal level of bureaucracy by merely distributing the claims among individual companies and drawing up in the standards as to what would fall under this category.

Senator STEVENS. This provision says:

If a default of the continued maintenance of an assigned claims bureau and assigned claims plan by any State in the manner considered by the secretary to be consistent with the provisions of this act, the secretary shall maintain such bureau and plan.

I take it that means they will be maintained at Federal expense. Are you implying that you think the industry itself is capable of undertaking such a bureau or clearinghouse on its own?

Mr. NICOLAYSEN. Yes, sir.

Senator STEVENS. What portion of the industry? I am trying to agree with you, but at the same time I would like to have you be specific. Who do you think would accept this responsibility? And if they won't accept it, who do you think we ought to impose it upon?

Mr. NICOLAYSEN. We think any automobile insurance company writing insurance in a given State would automatically belong to someone—they would be required to join the assigned risk plan in any given State, and it would be merely a matter in any claims that did not fall under the provisions of the existing no-fault concept, through a mechanism in the insurance department it would be merely assigned on a rotating basis following the companies based on their percentage of volume of business within a State.

We think this would be the most equitable situation and minimize large additional Federal framework.

Senator STEVENS. In other words you think this section should say something to the effect that the Secretary shall assure himself that there is an adequate assigned claims plan operating in a State. If there is not, he should require one. And if the State refuses to do it, then he should organize a bureau and impose the cost of that on the companies who are doing business in that State. Is that what you are saying in effect?

Mr. NICOLAYSEN. That is basically what we are saying; yes, sir.

Senator STEVENS. Thank you.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Rue, in order to have for the record some more information, I would like to ask you some questions relating to your views of the impact upon your operations as an agent if no-fault insurance were mandated through Federal standards or through Federal legislation along the lines of S. 945.

Let me ask you just a couple of things and ask you to give us an indication, if you would, whether you think the costs of your operation would rise or fall and what the overall result for your agency's picture and your particular income would be.

Now, the amounts paid to agents for policies we are told may go down under a no-fault proposal. Do you agree or disagree with that statement?

Mr. RUE. I would say it is probable, yes.

Mr. SUTCLIFFE. Commissions would go down?

Mr. RUE. Yes.

Mr. SUTCLIFFE. At the present time how many uninsured motorists on the average are there throughout the country?

Mr. RUE. I do not know what the statistic is. I believe I read just recently that in New Jersey where they do not have compulsory insurance per se but a form not dissimilar from the concept runs something like 5 to 8 percent uninsured. That is an estimate.

Mr. SUTCLIFFE. I think that the Department of Transportation's studies say the national average without the compulsory element is 15 to 20 percent. Under S. 945 I would imagine that those people in order to operate their vehicles on the highway would have to obtain insurance.

Mr. RUE. Right.

Mr. SUTCLIFFE. So even though the commissions would go down as a percentage of the policy, maybe an increase of money or at least maintenance of the level would result by requiring those uninsured motorists to obtain insurance?

Mr. RUE. You are saying we are going to sell more units at a lower cost and come out just the same.

Mr. SUTCLIFFE. Is that a reasonable supposition?

Mr. RUE. It may be. We are dealing with several intangibles. No. 1, what is the reduction in the commission? If it is 2 percent, that is one thing; if it is 10 percent, that is something entirely different. I am sure there might very well be an increase in the volume of purchases.

I think it is equally fair to say that our workload, our staff workload in my office where we do a great deal of work in processing, handling, following up, and arbitrating claims would undoubtedly be reduced if not totally eliminated.

Mr. SUTCLIFFE. That would be under a no-fault concept similar to S. 945?

Mr. RUE. Yes.

Mr. SUTCLIFFE. Have you had an opportunity to evaluate the impact of a bill like S. 945 compared to the proposal of Massachusetts where you still have a fault determination, albeit not in the courts, but under an interinsurer subrogation basis?

In the Massachusetts plan as compared to this particular plan, will your costs in terms of your own office operation be less because you will not have to cooperate with the insurance company in terms of investigation of the accident and claims processing and accounting for your claims cost in the event of the interinsurer subrogation?

Mr. RUE. I am not honestly sure I can answer your question, because I have not made a physical evaluation of it. I come back to my original supposition. I would suspect there would be some reduction in my office cost simply because I would be eliminating all of the claims work that we do or certainly quite a bit of it. Then, dependent on what the change in the commission factor was, this will determine whether I am going to come out better or am going to come out worse.

I do not know that such a cost study is even possible financially at this point in time because there are many intangibles here. We just do not have anything concrete.

Mr. SUTCLIFFE. But at least you are not certain that it would automatically lead to a reduction in your own income level?

Mr. RUE. I do not think automatically it will, but then again there are other alternatives, you. If I spend less time in the field, I may

spend more in some other field. Obviously, since I support this position, I am not terribly worried that it is going to put me out of business. This is the road we are leading toward. There will be readjustments, there will be cost readjustments, there will be income readjustments, all these things I am sure, but I think at this point in time when we do not have figures to work with and from, I would say that I do not think it is going to hurt me particularly.

Mr. SUTCLIFFE. Are any of the agents' associations using the information that is apparently supposed to be coming from our experiments in Massachusetts to gather the kind of information that would give you answers to some of these questions about what the impact upon a particular agency would be under a no-fault plan as opposed to the existing situation?

Mr. BRADY. Our three-State auto study committee has been trying to collect all the information that it possibly can to determine how it would affect an agency and how it would affect an agency operation. This is basically the reason for our being in existence as an agency association. What we have tried to do is to have other agents research this program and to help out a member who is not possibly aware of all the changes that are happening. We are going to get this information.

As to the Massachusetts program, at this particular point we have requested as much as we can get from them, and we are not exactly sure what we are getting is really reflective of what is actually happening. They indicate that the situation is such that the volume of claims is down greatly. It does not appear to us at this particular point that all of the accidents that have occurred are currently being settled. I think there are a lot of things just waiting a decision as to the constitutionality of that legislation.

So this is another intangible unfortunately. We can say yes, we are trying to do the best we can, but we do not know. We are trying to obtain all the information we can. So far everything new that has come down the pipe we have had in a few days, and our committees are meeting on a regular basis with that in mind.

Mr. SUTCLIFFE. You mentioned as a possible reaction to making automobile insurance secondary to private health insurance or any mandatory State-sponsored health insurance programs—one of the results you foresaw was an immediate elimination from the private health insurance sector of the automobile accident medical cost obligation. For the record, I would like to point out that upon the conclusions of the House Interstate and Foreign Commerce Committee's hearings, Blue Cross-Blue Shield informed Congressman Moss that they were not going in that direction but they were going in the opposite direction, to write within their policies the primary coverage, or would go in that direction if there was a private contract option available to them. So for the record and for your information, I repeat that at this time.

In your discussions of S. 946, the group merchandising bill, do your comments as to group insurance and the requirements that everybody within the group be eligible to participate in the group with certain exceptions that you enumerate relate to the true group operation as distinct from a mass marketing concept? In other words, are you drawing distinctions between mass marketing and group or true group merchandising.

Mr. BRADY. Yes, this is where you get in the semantics of it.

Mr. SUTCLIFFE. I think for the record—

Mr. BRADY. We are talking about true group operations.

Mr. SUTCLIFFE. And as to mass marketing operations, would you agree that there should be no restriction on mass marketing operations in terms of availability?

Mr. BRADY. Yes, in the sense of availability, yes. Our people are out soliciting right now.

Mr. SUTCLIFFE. It seems to me in this area we have certain unresolved questions as to what kind of parameters you place around the different operations, be it mass merchandising or be it true group merchandising. Are these things that might be best left to the regulatory process in terms of a flexibility of regulation to meet particular things as they arise?

Mr. RUE. Again, I think we are still talking in semantics. Essentially, the end result of all these various plans, it is the same form of group insurance by whatever name you want to call it. Our position has been that we are not opposed to this. We use the term "mass marketing" encompassing all of the variously named group, franchise, whatever. It is a thing that we have supported, but we do feel that we have to build certain protections in.

As a matter of fact, we have proposed such legislation in all of our States, not precluding mass merchandising but subjecting it to reasonable regulation in the interest of the public.

Mr. SUTCLIFFE. In S. 945 you suggest that to the extent it implicates the State insurance mechanism that it is best to eliminate that so that we don't create any kind of Federal regulation.

What specific aspects of S. 945 do you find as an intrusion into the State regulatory process? Is it those requirements that ask for a rationalization of some of the rating classifications and information as to true premium; is that the specific area of your objection in S. 945?

Mr. RUE. I am not sure I understand the question.

Mr. SUTCLIFFE. Let me put it another way, then. There is no authority in S. 945 to set rates for insurance policies. There is authority, however, to present information about insurance rating practices.

So, what I am asking you is this. Do you feel that the authority to require information to be gathered by the Department of Transportation and then promulgated to the public so they have an idea of how the insurance company is operating—do you find that an intrusion into the State regulatory process?

If not, where is the intrusion into the State regulatory process in S. 945 before this committee?

Mr. NICOLAYSEN. As long as the Senate bill restricts itself to a gathering of information. I personally don't feel that this is in any way detrimental to State regulation. However, I might point out that one of the items in here as an example is compulsory automobile insurance on a nationwide basis.

I come from New York where we have had a compulsory insurance plan for approximately 13 years which isn't working now and hasn't been working since the day it was instituted. The same thing could be said for North Carolina and Massachusetts. They essentially have the same procedures involved. As an example, in New York City it is perfectly possible to buy a forged F-1 which permits you to register

your car and without any paperwork being filed that that insurance has ever been revoked or the fact that you don't have insurance or don't have an accident. There is no way that the Bureau of Motor Vehicles would ever be aware of the fact that that person is driving without insurance.

Mr. SUTCLIFFE. Does that breakdown in the enforcement mechanism result from the lack of a uniform registration and titling law in New York?

Mr. NICOLAYSEN. No, because the working mechanism on the thing—as I understand, North Carolina has a title law, yet they are unable to enforce the compulsory aspect down there.

Frankly, in three States it has been attempted and in the three States there are all sorts of subterfuges which are turning loose uninsured motorists on the road. To talk about making it compulsory on the Federal level by implication is putting up a Federal bureaucracy to enforce this. This is why we question it is going to work.

Mr. SUTCLIFFE. So if that provision requiring mandatory writing prescribed to the extent possible the utilization of State authorities to enforce a Federal law, which can be done, that would then solve the problem of intrusion into the legitimate areas of State action.

Mr. NICOLAYSEN. I would think so. The main thing we are concerned about is an attempt to affect the rating mechanism at both the Federal and State law with the redundant licensing of insurance agents, et cetera, and many things that might arise from such a law of that nature.

Mr. SUTCLIFFE. One piece of legislation before this committee last year related to the insolvency problem. There was a specific prohibition against any requirements of Federal licensing and there was a prohibition against interfering with the present State operations in that area. If that kind of language were in the bill, would this become more acceptable to you to solve this intrusion problem?

Mr. NICOLAYSEN. As long as the Federal Government was merely restricting itself to information gathering in whatever form it chose to take—

Mr. SUTCLIFFE. And publication?

Mr. NICOLAYSEN. And publication. I don't think we would have any objection. The thing we are concerned about is duplication of facilities and duplication of paperwork as far as we are concerned by having to report to two organizations who are attending problems of that nature both for ourselves as individuals or as an association.

Mr. SUTCLIFFE. Are there any other portions of the bill that you would like to focus upon that might exemplify that kind of problem?

Mr. NICOLAYSEN. I don't really think so. The rest of them pertaining, as an example, to mandatory continued group coverage, and that is not really a matter that the Federal Government can be enforcing, so I don't think this will present any problems.

Mr. SUTCLIFFE. A final point. You mentioned the problem of an assigned claims plan.

Nationwide Insurance Co., in presentation of testimony before this committee on Tuesday suggested an industry-run reinsurance operation to take care of the assigned risk problem.

Could a similar facility, industry-run facility, take care of the assigned claims problem?

Mr. NICOLAYSEN. I see no particular reason why it couldn't. In fact, it could probably use the same facility. Unrelated to this particular thing, but we have been advocating in the fire pool arrangements that we go to a reinsurance treaty rather than the present type of setup we have whereby each company will individually issue policies and reinsure them back to the pool.

We have always advocated in most cases that some form of universal reinsurance of automobile underwriting can handle most of these problems relatively simply.

On the hospital primarily, to give you a little background of what we were thinking about when we were recommending it, I took two individual companies as an example and found that it was possible to have 600 variations of coverage with one company and over a thousand with another.

To attempt to set up actuarially where we are giving credit for this type of variety, just choosing the two companies when there are many hundreds of companies that write hospitalization, we felt created an actuarial problem. In addition, purely from an agent's viewpoint, FAA insured who has Blue Cross, for example, is involved in an automobile accident which involves ambulance, emergency room, and hospitalization, Blue Cross and Blue Shield will not pay for the ambulance or the emergency room; it will pay for some role in the hospitalization problem.

From the viewpoint of any agent, we have got to sit down and ascertain what coverage they have, what they are going to pay, what they are not going to pay, does he have group insurance, et cetera, and the paper workloading of attempting to have the hospitalization as primary we feel is going to necessitate that the agents are going to have to be paid more simply to cover trying to track down who has what and handle this type of paperwork situation. We are handling the property damage already. It is very simple for us to pay the medical right off the top of the property damage with little or no additional investigation.

Mr. SUTCLIFFE. To the extent that a national health insurance program, either one like the Kennedy bill which is State-managed or one like the administration has proposed which utilizes the private insurance industry, to the extent a plan like that would be proposed you would have no problems making that primary over the automobile insurance system in terms of the problems that you point out?

Mr. NICOLAYSEN. If it is a case of we are dealing with one monolithic plan which covers the entire United States, the answer is probably we wouldn't be able to, there wouldn't be any great difficulty. But with the proliferation of income disability, accident plans, hospitalization, Blue Cross-Blue Shield, major meds, et cetera, under the present system it is going to be a tremendous paper workload both for the public and the insurance industry under the proposed plan to try to integrate the two plans with any sort of reasonable consistency.

Mr. SUTCLIFFE. But if that integration and rationalization takes place through actions in the health insurance area, you would see no objection to having that as a primary source for that medical?

Mr. NICOLAYSEN. But again up to what the deductible was on the catastrophe insurance that is being proposed. We would still advocate

that the auto be primarily up to the level where you got to a Federal- or State-mandated comprehensive plan that would go into force, but we are still dealing with plans that will be issued to cover the gap between and Federal catastrophe insurance.

Mr. SUTCLIFFE. So the standard deductible approach would be one way to solve some of the paper workload?

Mr. NICOLAYSEN. Right, this would be correct. You would still have the question of whether or not, from a purely philosophical viewpoint, automobile ought to pay for auto rather than to attempt to foist it off on the general public as part of hospitalization.

Mr. SUTCLIFFE. That would really depend on what kind of a plan was put forth by the Government for health insurance operations, because if you internalize the cost under the health insurance program, you wouldn't lose anything then of the user tax internalization argument that you have just presented.

What I mean is, if you have a health insurance program that has internalized all costs and kept lids down appropriately, then you wouldn't have to worry about losing that aspect of it for the user tax approach in the auto industry?

Mr. NICOLAYSEN. Probably not, but as a purely philosophical viewpoint, I happen to feel if the person wants to drive a car, he should be responsible for all the costs thereof, including any and all insurance cost.

Mr. SUTCLIFFE. Thank you very much.

Senator HART. Gentlemen, before you leave, do you, who have not spoken yet, have any addition you would like to make for the record?

Mr. RUE. There is none, Mr. Chairman.

Senator HART. Thank you very much.

(The statements follow:)

STATEMENT OF CHARLES L. RUE, CPCU, CHAIRMAN, NATIONAL AFFAIRS COMMITTEE, IN BEHALF OF THE INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATIONS OF CONNECTICUT, NEW JERSEY AND NEW YORK

I. INTRODUCTORY MATERIAL

My name is Charles L. Rue. I am an independent insurance agent and a Chartered property and casualty underwriter from Trenton, New Jersey. I am testifying today on behalf of the Independent Mutual Insurance Agents Associations of Connecticut, New Jersey and New York State, which, collectively, represent 3,500 agencies and 10,000 individual agents in these three states and service approximately 5,000,000 insured persons. I am currently Chairman of our three-state National Affairs Committee.

Objectives

The objectives of our testimony today are two-fold:

1. To express our basic philosophy on the subject of automobile accident reparations reform and the related subjects encompassed by Senate Bills 945, 946, and 976.
2. To comment on the few specific portions of these bills to which we object or which raise serious questions in our minds—I might add that these are relatively few, because, by and large, we are very favorably disposed toward the objectives of this package of legislation.

II. SENATE BILL 945 UNIFORM MOTOR VEHICLE INSURANCE ACT

IMA position on first party reparations

Our three associations, both individually and collectively, strongly support the concept of a first party automobile accident reparations system, and, in keeping with that philosophy, we will actively support any measure which represents a reasonable evolutionary step in that direction.

This position stems from an intensive study of accident reparation problems conducted by our three-state Automobile Study Committee in 1968, the findings of which were published in the fall of that year. To save the time of this committee, we are appending that report to the official copies of this document and will simply summarize our findings as follows:

1. *Objections to tort system*

Our objections to the present tort liability system hinge upon these six points:

- a. Claim settlements have tended to be painfully slow, with delays ranging from several months to several years still occurring in cases of large claims associated with serious accidents.

- b. Many accident victims presently receive no compensation for their losses, perhaps because of some insignificant degree of contributory negligence. Similarly, many are grossly underpaid for their losses.

- c. A significant portion of many tort settlements is diverted to court costs and legal fees, never reaching the accident victim.

- d. The tort system *appears* to be a factor in court congestion. Please note, however, that we *cannot* support this point statistically; and we are fully aware that many respected bar groups have compiled impressive evidence to the contrary. Nevertheless, whether our own limited evidence be circumstantial or purely intuitive, we are convinced in our own minds that far too many accident cases, particularly those involving relatively minor claims, are cluttering up our courts. Our own agent-client relationships tend to bear this out, but beyond this, we simply cannot debate the issue intelligently.

- e. Fault itself, the basis of the tort system, is extremely difficult to prove in many cases, impossible to prove in some, and the process of proving it generates extremely high investigation costs for the insurance companies involved. To those who attempt to dispute this fact, we direct three simple questions: Why do virtually all accident cases require investigation? Why do so many cases wind up in the courts? Why are so many people engaged in the obviously lucrative business of claims investigation and adjustment?

- f. Finally—despite its supposedly punitive nature, which places both the stigma and the liability for wrongdoing upon the guilty part, the tort system has apparently done little to reduce our disgraceful highway accident rate or remove chronic offenders from the road.

2. *Advantages of first party system*

Our studies lead us to believe that at least four major advantages would accrue from a first party system:

- a. It would result in faster claim settlement. This is a decisive factor in the immediate aftermath of serious accidents, when medical and/or repair bills accumulate most rapidly, when victims most frequently find themselves confronted with financial crisis, and when funds are urgently needed for rehabilitation of seriously-injured persons.

- b. It would lead to more equitable settlements, with *every* accident victim receiving reasonable compensation for his losses and a smaller portion of any settlement being eroded by litigation costs. In nothing else, this would keep many people off our burgeoning welfare rolls.

- c. It would *probably* reduce court congestion, although we refer you immediately to our previous statement on this subject and our lack of statistical evidence.

- d. It would eliminate the costly and difficult problem of proving fault before compensating the accident victim.

3. *Primary versus secondary coverage*

On one point we take a very strong position: We believe that Automobile Insurance should occupy the primary coverage position in the settlement of any and all claims arising from automobile accidents. Conversely, it should not be placed in a position secondary to collateral coverages held by the insured. We base this reasoning upon the following four points:

- a. Persons carrying valid automobile insurance who are injured in automobile accidents should *not* be required to exhaust benefits which they have accrued to protect themselves against natural illness or other mishaps.

- b. Administrative confusion resulting from a secondary coverage system would be monumental. It would be virtually impossible to devise a comprehensive rating system for automobile insurance which would mesh with the staggering number of accident, health, medical and income protection plans offered through other sectors of the insurance industry.

Furthermore, shifting administrative costs of processing bodily injury claims to hospitalization insurers would not greatly reduce the administrative burden on the auto insurer, since any accident causing significant injury will undoubtedly be accompanied by a considerable degree of property damage. Hence, the auto insurer is already in the act, and the additional administrative cost of processing the injury portion of the claim would be negligible.

c. The economic cost of highway accidents should be borne entirely by highway users. Yet, a secondary coverage statute, while undoubtedly effecting some savings in automobile insurance premium, would simply shift the burden of highway economic losses to the rest of the public in the form of higher premiums for other hospitalization and/or medical insurance. Needless to say, the accident and health insurers would probably respond quickly by excluding automobile accident losses from their own coverage, thus further muddying the waters.

d. People buy automobile insurance to protect themselves against losses suffered in automobile accidents, and that insurance alone should protect them fully against *all* such losses, except where covered by Workmen's Compensation.

POSITION ON SENATE BILL 945

With a few exceptions, Senate Bill 945 is a major step toward our own ultimate goal. Is is a farsighted measure which provides for virtually every contingency that might arise under such a system, and we commend Senator Hart and his committee for the research and the thought which went into its preparation.

However, we do object to and/or question the following four provisions of this bill:

1. Sec. 2(12) (A), by definition of "net economic loss," places automobile insurance in a secondary position to collateral coverages. This is totally unacceptable to our associations for the reasons outlined immediately above and constitutes our principal objection to the bill as presently worded.

2. Sec. 3 virtually mandates compulsory automobile insurance on a nationwide basis. While the concept has definite merit, particularly in the eyes of responsible citizens, we must question its enforceability. Even in such states as New York, one of the pioneers in strict, compulsory automobile insurance, a significant number of uninsured drivers still find access to the highways. Furthermore, to be totally objective, the responsible person would almost unquestionably insure himself, with or without a compulsory insurance law, and the person so irresponsible as to drive without coverage doesn't belong on the road at all.

3. Sec. 5(d) (I), in conjunction with Sec. 5(a) (3) (8), provides virtually all of the protections for the insurance industry which we have repeatedly asked for in testimony before state legislative and/or insurance department hearing commissions. We are most grateful for this.

We do, however, raise one point for your serious consideration. With the noted exclusions, all of which are subject to punitive action, this section of the bill is virtually a lifetime mandatory issue, guaranteed renewal and non-cancellation provision. The intent sounds fine—and I might add that our associations, in their own states, have been in the front lines of the battle to stop frivolous cancellation, non-renewals and refusals to insure good risks. These are just as much a threat to our own livelihood as they are to the public.

But Sec. 5(d) (I) of this bill represents overkill. There are many risks—the perpetual "fenderbenders", for example—who are not subject to punitive action yet who cause enormous losses for insurance companies, losses ultimately passed on to the entire insured public. This provision makes it mandatory for an insurer to cover these people for life. True—the next sub-section, Sec. 5(d) (2), exempts an insurer who is facing insolvency. But can we legitimately force a private business firm to accept, without time limitation, business which will ultimately drive it into bankruptcy?

We question the constitutionality of such a requirement and, therefore, oppose this section of the bill as presently worded. We suggest instead a clause of similar intent but with a statutory limitation of perhaps three to five years, after which the insurance company, upon presentation of reasonable supporting evidence, could elect to discontinue coverage.

4. Sec. 7(a) would establish, at state level, an "Assigned Claims Plan." The objective is obvious and basically sound—namely, to deal with contingencies not otherwise covered in the basic law. However, we do wish to point out that this provision will require the establishment of 50 new state agencies, or ~~an even larger~~ number, supplemented by a sizable new federal agency—all of which will cost

a considerable amount of money to operate. Unfortunately, we can offer no constructive alternative. But we do suggest that this mechanism be analyzed *very* carefully before implementation, with an eye toward making the basic law so comprehensive that the rare contingency can be handled within the framework of existing agencies, at little or no extra cost to or subsidy by the public.

In short, if Senate Bill 945 were amended to place the automobile insurance in a primary coverage position and to soften the overly-stringent mandatory issue requirements, we would view it as a model piece of legislation and support it enthusiastically.

III. SENATE BILL 946: MOTOR VEHICLE GROUP INSURANCE ACT IMA BASIC POSITION

To place our comments in proper perspective, we are compelled to open our discussion of Senate Bill 946 with a brief question of semantics.

This bill, as presently worded, deals *only* with "group" insurance. We wonder if that limitation is truly the intent of the sponsors. "Group" insuring is actually one of several types of marketing techniques commonly lumped together under the more general heading of "mass marketing." "Franchise" and "collective" marketing are other examples of the broader category. Since our position on "mass marketing" is already clearly defined, and since the term encompasses "group" insurance, we will discuss Senate 946 in the context of the broader terminology.

Our associations, individually and collectively, are firmly committed to the principle of reasonable regulation of mass marketing. In fact, we actually originated the bills which led to a mass marketing guidelines statute in Connecticut and Insurance Department regulatory guidelines in New York State.

Before going any farther, let me make one thing abundantly clear—despite some accusations to the contrary, our goal most assuredly is *not* to kill mass marketing ("group" insuring, if you prefer) or even to impede it. Quite to the contrary, we recognize it as a viable, modern sales technique which can bring significant savings to the insured public. Furthermore—from a purely selfish standpoint—several of our own members have already acquired sizeable mass marketing accounts, and many others are seeking a piece of the same action.

But make no mistake—uncontrolled mass marketing invites a number of abuses which could prove highly detrimental to the insured public. In our estimation, the following five pose the greatest immediate threat:

1. General application of discriminatory underwriting practices, whereby an insurer underwrites only those members of a group who, in that insurer's estimation, constitute the best risks. This is the practice commonly known as "cream skimming".

2. Arbitrary cancellation or non-renewal of policies already issued to members of the group, leaving the victims to seek replacement coverage in an increasingly restricted market-place. This is probably even more insidious than initial rejection.

3. Selective underwriting practices, which would deny coverage to youthful drivers, drivers over 65 years of age, certain ethnic minorities, inner-city property owners and similar groupings.

4. Failure to provide continuity of coverage to those persons leaving an insured group, for whatever the reason.

5. Unless completely separate record keeping is mandated and rating for each group based upon the experience of that group alone, the rest of the insured public could find itself subsidizing any group losses which might occur. Those records, needless to say, should include a complete breakdown of management expenses at all levels to prevent parent insurance companies from disguising in their own records, and passing along to their own clients, losses deliberately incurred through underpricing by subsidiary or "pup" companies.

Gentlemen, this is not just alarmism. These things do happen, and we are very slowly but very surely gathering examples. Without some safeguards, the end result could be the creation of a very large and relatively uninsurable residual market comprised of group rejects and other people not fortunate enough to be insured through group or other mass marketed plans. Many of these could hope for little more than assignment to high-cost assigned risk pools.

We think that the key to effective control lies in two words: "Guaranteed issue"—in other words, the requirement that an insurance company offering a group plan accept *all* eligible members of the group, without resorting to the discriminatory underwriting practices which we just outlined. I'll come back to this point in a moment.

POSITION ON SENATE BILL 946

Senate Bill 946 contains elements which we find both pleasantly surprising and paradoxical. Sec. 3 clearly conveys the intent of the measure—namely, to prohibit overly-restrictive controls which would impede the natural evolution of group or other forms of mass marketing. Yet Sec. 2(2) begins to approach the very "guaranteed issue" requirement for which we have fought so vigorously in our own states. We view this as a major step in the right direction.

In fact, we respectfully suggest that with the addition of the following items, Senate Bill 946 would approach our own concept of a model mass marketing guidelines bill:

1. A provision prohibiting compulsory participation in a group insurance plan as a condition of employment or group membership—in other words, protecting the group member from coercion by an employer or other group sponsor.

2. A requirement that a person leaving the group, for whatever reason, be granted the privilege of continuing his coverage for a reasonable length of time or of converting it to a regular policy with the same insurer.

3. The addition of the following exclusions to the guaranteed issue provision:

a. Failure to pay premiums.

b. Fraud or misrepresentation in the application for insurance.

c. Termination of the group.

d. Also, conviction within the previous three years of:

(1) Operating a motor vehicle while intoxicated or under the influence of drugs.

(2) Leaving the scene of an accident.

(3) Use of a motor vehicle in committing a felony.

(4) Operating a motor vehicle with the specific intent of causing injury or damage.

(5) Making false statements in the application for a motor vehicle operator's license.

(6) Operating a motor vehicle while the operator's license is suspended or revoked.

Please note that these exclusions are an extension of and completely in context with those granted in Senate Bill 945. They simply provide reasonable protection to the group insurer against the criminals, chronic offenders and other such risks which would not be insurable under any normal circumstances in the regular voluntary market.

Our only specific objection to Senate Bill 946 involves Section 5. We believe that actual regulation of group and other forms of mass marketed insurance should be retained at state level and, in keeping with this, that jurisdiction over violations should rest with state insurance commissioners and state courts rather than the federal government. I'll have more to say about our reasoning in a moment.

IV. SENATE BILL 976: MOTOR VEHICLE INFORMATION AND COST SAVINGS ACT

Gentlemen, this bill lacks just one closing word: Amen!

Improperly designed and maintained vehicles have been one of the basic causes of our automobile insurance difficulties and perhaps the primary cause of our high insurance rates. It appears at long last that someone has seen the light and is going to have the courage to do something about it—and incidentally, we believe that this particular problem can only be treated at federal level.

We hope you will stick to your guns, pass this bill now and continue to strengthen it in the future. You have our full support and our heartfelt thanks—and we know the public will join us when they see the impact on their automobile insurance rates.

V. STATE VERSUS FEDERAL JURISDICTION

We would like to close this testimony with a brief statement of our position relative to the question of state versus federal regulation of automobile insurance.

Please be advised that we are firmly committed to the principle of state regulation and control of insurance activities, within the context of Public Law 15 of 1945, the so-called McCarran Act.

This does not infer in any way that the federal government could not perform competently in this area. Furthermore, the concept of federally-mandated standardization of automobile accident reparations laws possesses great merit.

However, we believe that continuation of state regulation and control offers three overwhelming advantages:

1. Automobile accident problems and associated insurance problems have a definite regional flavor. They are directly influenced by population density, vehicle density, occupational pursuits of the area, weather patterns and similar factors. Stated another way, you cannot compare insuring conditions in New York City with those of a Kansas farm community. Hence, we believe that regional or state regulation is simply more practical and would be more responsive to local needs.

2. The state regulatory mechanism already exists and, for the most part, we believe it has been effective. Furthermore, it will continue to exist, even if the federal government assumes jurisdiction over automobile insurance, because automobile insurance, after all, is only one area of a vast insurance picture. Why waste these existing facilities?

3. Assumption of jurisdiction over automobile insurance by the federal government would require the establishment of a fairly large and highly complex new federal agency. This would be a costly operation, and the public would ultimately pay for it in the form of higher insurance premiums and/or higher taxes. For disturbing implications of what could lie ahead, we need point only to those portions of Senate Bill 945 which call for the establishment of new agencies and appropriation of public funds.

Now—criticism is worthless unless constructive, and we do have a constructive suggestion. If Senate Bills 945 and 946 are indeed passed into law—and remember that we would support them readily with the revisions noted above—then pass them in the form of standardized guidelines for implementation at state level, giving the states a reasonable period of time to do so. The new crime insurance law provides ample precedent for such a course of action, and we are convinced that it is the most practical and economical approach.

Thank you for permitting us to testify today. We hope that our suggestions will be of some value to you and that the outcome of these hearings will be a positive move in the direction of realistic and long overdue automobile reparations reform. The public has already waited too long.

A REPORT OF THE AUTO STUDY COMMITTEE OF THE INDEPENDENT MUTUAL INSURANCE AGENTS NEW YORK-NEW JERSEY-CONNECTICUT

FOREWORD

Faced with an angry, often confused din from an irate public and a perplexed, irresolute industry, IMA moved in the direction of a three-state committee geared for a high level study of the auto insurance problem in January, 1968.

Even as the IMA Auto Study Committee met for its first time on February 29 of this year, strong and forbidding forces were at work. A seemingly revolutionary of of auto insurance was being aggressively championed by two law professors by the names of Keeton and O'Connell. Certain legal groups were marshaling their forces to dissipate the drive of the two professors. Officials of the nation's courts were under fire and firing back. Associations of insurance companies and agents were groping defensively and inconclusively for facts, figures and a position. Newspapers and magazines were finding auto insurance an easy and entertaining open wound into which to rub salt. Legislators saw an unimpeachable cause to champion. Investigations into auto insurance began at all levels of state and federal government.

Through all this rancorous confusion, one note seemed to ring with unfailing clarity. There must be change! From the man on the street to the President of the United States, this much was clear. The question resolved itself into the further question: Who will do the changing? And what form would the change take?

Both questions were equally vexing. A profusion of plans for change quickly exploded on the muddy marketplace of ideas, with no one program galvanizing universal support. These deliberations, difficult and trying under the best of circumstances, were exacerbated by perhaps the ultimate horror—federal regulation. There was—and is—no dearth of advocates for a federal solution.

The pressure from legislators, press, various officials, public and others make a federal solution much more than an implausible menace. In fact, to a growing number of serious thinkers, the matter seems to boil down to this choice: Either the insurance industry will make changes or the federal government will step in and make changes.

It is little secret that the federal government might make changes unfavorable to the insurance industry. For many independent agents who rely on auto insurance as a large part of their income, the changes might be the death knell. Or, the changes might just be the death of the auto insurance industry—period. At any rate, it is highly unlikely that the public would be better served. We cherish the idea that private industry and private initiative at its best is better than a federal system at its best—insofar as auto insurance goes.

Having made the choice to attempt to change ourselves without government direction, we have been forced into a consideration of what changes would be best. That is, what changes would be best for both the insurance industry and the insurance-buying public the industry is committed to serve. Anything less would be doomed to failure from the start.

The matter of choice has not been easy nor has it been quick. Intelligent choice comes only from an intelligent consideration of alternatives. In the case of this committee, we believe that every known alternative has been carefully weighed. Not only have all the alternatives been weighed, but every conceivable combination of them has been deliberated and debated. And, what is more, this committee has made every human attempt to ponder the alternatives without preconceptions and prejudices.

Our deliberations have not been inconclusive. We have looked at—just to name a few—the Logan Plan, the Smith Plan, Guaranteed Benefits, the Saskatchewan Plan, the Chicago and Columbia Studies, Keeton-O'Connell, the Collins Plan, the Green Plan, the Ehrenzweig Proposal, the Massachusetts Broker's Plan, the Conard Study, the California Bar Proposal, Knock-for-Knock, the Nationwide effort, the Sharp Proposal, the Murray Plan, the Miley Plan, the Blum and Kalven Report, Ontario Plan, the Red Badge Plan, the Cooperators Plan, the General Accident and American Family Plans, the American Bar Proposal. We have looked at no-limit policies, Advanced Payments, compulsory med pay, adoption of comparative negligence, the ruling out of certain immunities, restriction of contingent fees. And we have looked even further.

And yet, when all criteria are considered and when every factor has been weighed, we must return to the basic thinking of those two professors by the names of Keeton and O'Connell. *What we are recommending is not their Basic Protection Plan as published and known back in February. What we are recommending is a first party system.* And the latest version of Basic Protection in Massachusetts incorporates far more of the features we feel are necessary to an equitable system for all concerned than any other plan or combination of plans.

In the following pages of this report, you will find the names of the various men who gave so generously of their time and thought to this committee, the reasons advanced by those opposed to the type of system we recommend, our reasons for supporting our conclusion and a description of the plan we recommend—which, by the way, includes some of the committee's own additions to the thinking of Professors Keeton and O'Connell.

The Auto Study Committee of the Independent Mutual Insurance Agents Association,

ROBERT W. BAYLIS, *Chairman.*

First Vice President of IMIA of N.Y.

HARRY L. ASHMORE, *Past President,*

IMIA of Connecticut-Danbury, Conn.

J. STANLEY BRADDOCK, *director.*

IMIA of New Jersey-Medford, N.J.

THE SYSTEM IMA RECOMMENDS

It should be clear that this committee is endorsing a first party system, first and last. What precise form it might eventually take we leave in the hands of intelligent evolution.

Acceptable minimum requirements for such a system include:

- (1) Availability of increased limits (over Basic Protection);
- (2) The option to buy back duplicating coverages;
- (3) A pooling system whereby companies would get necessary credits;
- (4) An individual's right to bring suit beyond the \$10,000 waiver limit;
- (5) The stipulation that any company offering Basic Protection must also offer liability insurance.

At this point in time, the first party plan that appears to have the greatest viability is Basic Protection as stated in Massachusetts House Bill 4890. This

optional plan has the near-unanimous backing of the IMA Auto Study Committee.

A brief description of Massachusetts House Bill 4820, in Professors Keeton and O'Connell's own words follows:

"Under this proposal, existing liability insurance status (requiring the purchase of motor vehicle Bodily Injury Liability insurance and encouraging the purchase of Property Damage Liability insurance) would remain in effect.

"Each Bodily Injury Liability insurance policyholder would be offered the option of electing Basic Protection insurance along with his liability insurance. When thereafter injured in an automobile accident, a person who had made this election would be entitled to have his net out-of-pocket losses up to \$10,000 reimbursed by his own company, without regard to who was at fault in the accident. Within specified limits he would waive his rights to negligence claims against other drivers having insurance in a participating company. Ordinarily the policyholder's election would apply to all the members of his household. The waiver would apply to the extent of the first \$5,000 of pain and suffering damages and the first \$10,000 of other damages (such as wage losses and medical expenses, for which payments would be made under Basic Protection without regard to fault).

"The proposed statute requires that the policyholder's company, along with other companies writing automobile liability insurance in the state, participate in a pool that would guarantee that this company be credited with the cost savings resulting from his waiver of negligence claims: In turn, the statute requires that his company pass along to him, in the form of reduced premium charges, a fair share of all such cost savings. Thus, it is expected that the average Basic Protection policyholder could buy the combined package of Bodily Injury Liability insurance and Basic Protection insurance at less cost than he now pays, or would pay under the new system, for Bodily Injury Liability insurance only. The savings for the Basic Protection policyholder are further increased because he would no longer need Medical Payments and Uninsured Motorist Coverages, the benefits of which are included within Basic Protection.

"Similarly, each Property Damage Liability insurance policyholder would be offered the option of electing Vehicle-Damage Added Protection insurance along with his liability insurance. A person electing this coverage would be entitled to reimbursement from his own company for damage to his own car, without regard to who was at fault. This is a benefit comparable to that now paid under Collision insurance. He would waive his rights to negligence claims against other insured drivers for damage to his car. Through the pool, his company would be credited with the cost savings from his waiver of negligence claims, and in turn he would receive, in the form of a reduced premium, a fair share of all such cost savings. Thus, his combined premium for Property Damage Liability insurance and Vehicle-Damage Added Protection insurance would be lower than the combined premium for Property Damage Liability insurance and Collision insurance.

"If a person still preferred to be paid under the rules of the present system (for example, because he wanted to have a chance at pain and suffering damages, even in small cases) he could simply decline these optional new coverages (Basic Protection and Vehicle-Damage Added Protection), and he could still carry Medical Payments, Uninsured Motorist, and Collision coverages."

Two options Professors Keeton and O'Connell describe in a memorandum dated July 15, 1968, seem worthy of inclusion in any legislation. The first is called "General Damages Added Protection Coverage" and applies to pain, suffering, inconvenience and physical impairment. The second option is named "Net Loss Added Protection" and is designed, as its name implies, to provide greater net loss protection than the basic plan.

Other features of interest in the Massachusetts Bill, again to quote O'Connell and Keeton:

"Periodic reimbursement.—Basic Protection benefits are payable month by month as losses accrue, subject to lump-sum payments in special circumstances."

"Reimbursements limited to net loss.—Basic Protection benefits are designed to reimburse net out-of-pocket loss only; overlapping with benefits from other sources is avoided by subtracting these other benefits from gross loss in calculating net loss."

"Loss consists of expense and work loss.—Out-of-pocket loss for which Basic Protection benefits are payable consists of reasonable expenses incurred and work loss. Work loss consists of loss of income from work (for example, wages) and expense reasonably incurred for services in lieu of those the injured person would have performed without income. For example, the expenses of hiring

household help to do work a housewife had been doing before being disabled by injury are reimbursable."

"Deductible losses.—The standard deductible of Basic Protection coverages excludes from reimbursable losses the first \$100 of net loss of all types or 10 percent of work loss, whichever is greater. However, if two or more persons in one family are injured in an accident, the deductible is \$100 for the entire family, or 10 percent of work loss, whichever is greater."

"Standard limits of liability.—The standard maximum liability of an insurance company on any Basic Protection policy is \$10,000 per person for injuries sustained in one accident, with no per-accident limit. An additional limitation prevents liability for payments of more than \$750 for work loss in any one month."

"Optional exclusions.—At the policyholder's option, an exclusion may deny benefits to any person who helped to cause his own injury by engaging in serious misconduct such as driving while intoxicated, racing, or driving without a license or without permission of the owner of the vehicle."

"Bodily injury liability insurance companies must offer basic protection.—Accompany writing automobile Bodily Injury Liability insurance must offer to each policyholder of such coverage the option of Basic Protection insurance. A policyholder cannot purchase this optional coverage unless he also purchases Bodily Injury Liability insurance."

"Extraterritorial injuries.—A Basic Protection insured is entitled to Basic Protection benefits regardless of whether his injury occurs inside or outside the state where the policy is written."

"Claims against persons outside the system; subrogation.—A Basic Protection insured is still entitled to bring his negligence claim in full against any driver who is not a qualified insured (i.e., any insured covered under the Bodily Injury Liability coverage of any policy with which Basic Protection was offered, whether or not it was elected.) The Basic Protection insured's own company, upon paying benefits, may be subrogated to the Basic Protection insured's negligence claim—that is, it may get back out of the claim against the other driver and his company what it pays to the injured person. Such subrogation recoveries serve to reduce premium charges for Basic Protection insurance."

"Rehabilitation.—Special provisions are made for paying costs of rehabilitation, including medical treatment and occupational training, and for imposing sanctions against a claimant when an offer of rehabilitation is unreasonably refused."

"Claims and litigation procedures.—In general, the Basic Protection system preserves present procedures, including jury trial, for settling and litigating disputed claims based on negligence; modifications adapt these procedures to the Basic Protection system and particularly to periodic payment of benefits."

"Rules applicable if a victim dies.—The benefits of Basic Protection extend to survivors when a motoring injury causes death; the extent to which waivers of negligence claims by Basic Protection insureds have effect when an injured person dies may depend upon state constitutions, statutes and judicial decisions; probably the waivers would be held effective at least to as great an extent as a release signed by an injured person after he was injured and before he died."

"Property damage liability insurance companies must offer vehicle-damage added protection coverage.—A company writing Property Damage Liability insurance must offer to each policyholder of such coverage the option of Vehicle-Damage Added Protection insurance. A policyholder cannot purchase this optional coverage unless he also purchases Property Damage Liability insurance."

"Vehicle-damage added protection benefits not based on fault.—Under this optional coverage, the owner of the insured car claims directly against his own insurance company for the damage to his car. In this respect the new coverage is like the Collision insurance that has long been offered in automobile insurance policies."

"Waiver of negligence liability claims for damage to vehicles.—A Vehicle-Damage Added Protection insured waives his negligence claims against qualified insureds for damage to his car, including claims for loss of use. The qualified insureds are all insureds under the Property Damage Liability coverage of any policy with which Vehicle-Damage Added Protection was offered, whether or not it was elected. The companies offering such policies must participate in a pooling arrangement to assure that the savings from these waivers are credited to Vehicle-Damage Added Protection policyholders and not to other policyholders."

"The insurance unit and marketing arrangements are not altered.—The insurance unit under the Basic Protection plan is the same as under the present system; ordinarily a policy will be issued on a vehicle described in the policy to the owner of that vehicle. It is expected that the new coverages will be marketed in the same way as automobile negligence liability insurance (Emphasis ours)."

COMMONLY CITED OBJECTIONS

Like all major issues of modern times, auto insurance reform has had its army of articulate adversaries. Again like other issues, the detractors are cast into their roles for a number of reasons.

Too many, it must be bluntly said, are simply fearful of change, and are constructing rationalizations to support their feelings. Still others disagree for a defensive sense of self-interest. Most take issue because they have a sincere desire to see justice done but have yet to fully appreciate the alternatives.

No matter what their motives, these critics have amassed an array of arguments against a Keeton-O'Connell-type approach. The most common say:

1. BP will not lower costs. Or, if it does, the savings will be so slight as to be totally inconsequential. Or, it may well raise costs.

2. BP may be unconstitutional. Just how and why even lawyers can not say.

3. It is not equitable to say there is no pain and suffering worth compensating below \$5,000.

4. BP would not really expedite claim payments because the monthly payments would be extremely difficult to compute and distribute.

5. By preserving the tort system for large claims, BP would start an avalanche of large claims that would not cure, and might even compound, court congestion.

6. BP, with its broad definitions, will not cure fraud but be an open invitation to many an "unwitnessed accident." (So do M.P. and W.C.)

7. BP will cause an unequitable distribution of costs from those most likely to cause accidents to those most likely to collect the largest sums.

8. BP will cause a rating and actuarial nightmare. (Not true of accident insurance companies).

9. BP will result in all manner of interstate confusions and complications.

10. BP will doom the smaller and middle sized companies and their agents because, variously, of mass merchandising, of large administrative costs, of large retraining costs, of rating uncertainties. (Other feel BP would stabilize industry).

11. Rates will be inadequate, excessive or unfairly discriminatory. (Same argument is often made against present rating methods).

The above list by no means catalogues every objection ever made against a Keeton-O'Connell type plan. But it touches on the major objections made by serious and well-intentioned thinkers and researchers.

All these criticisms, plus many more of not enough substance to deserve inclusion in the list, have been considered at great length and with the utmost gravity by this committee. Yet, in the opinion of this committee, these objections—whether taken slightly or as a whole—are insufficient.

Not only are they insufficient, but in many cases they are, in this committee's opinion, unfounded. We believe, that the plan we are recommending would create a rating and actuarial climate immeasurably superior to the present one—in short, the polar opposite of what the critics suggest. Nor can we give any credence to the ideas basic protection will pamper the reckless and irresponsible while harming the innocent and upright. Nor do we believe that it is inherently inviting to fraud or a flood of large tort actions. Nor do we believe there is any credible reason to suspect a first party system such as Basic Protection in its option version to be unconstitutional.

We find the other objections similarly lacking or baseless. Certain of these criticisms, it must be remembered, were addressed to a difficult form of Keeton-O'Connell than we are recommending. Because of this fact, many once-valid objections are no longer relevant or viable.

It is this very evolution of Keeton-O'Connell that has been one of its most enduring and exciting characteristics.

Now let us turn to the reasons we favor such a plan.

WHY WE FAVOR SUCH A PLAN

Basically, we favor the plan we've described because it is moral, just, humane, ultimately economical and profitable.

For the first time in our history, accident victims may be spared the ruinous degradation of slipping hopelessly into debt while waiting from a claim to be settled.

These same people will have a better chance of being rehabilitated surely and quickly because the money will be available—when it is needed.

The chances are good these people will enjoy the pleasant sensation of seeing their auto insurance bill reduced somewhat. If it stays the same, they will be happy to know they are buying fail-safe insurance and protection at no increase in cost. And, should their bill be raised ever so slightly, they can take pleasure at having gotten a greatly increased value at only a slight increase in cost. Whatever the price, they can have the immense satisfaction that comes from spending money for one's own welfare—not that of a stranger's.

In many instances, these people will be spared the incredible tedium and antagonism of the adversary system. No longer will people be forced to swear unswervingly to what they can neither swear to or remember exactly. Society can ill afford a machine that overmanufactures enmity and enemies.

The fact that accident victims are spared money and misery is of towering importance. Because its effects will reach throughout the whole system.

There is a strong chance the courts will become unclogged. Society will be spared the spending of needless welfare and relief monies for accident-created paupers. And life for the insurance agent and the industry as a whole will become easier as the present attacks from legislators, bureaucrats and the mass media subside.

Not the least of the beneficiaries of our plan will be insurance agents. Most importantly, the plan will put the agent back into the claim settling business. This in turn will give him more control of his business and the chance to offer a brand of service far more personal and effective than is presently possible.

Companies, too, should have reason to applaud such a plan. They will have fewer furious policyholders who thought the purchase of auto insurance meant the company who sold the policy was going to pay, no matter what, if an accident occurred. Likewise there will be fewer incensed third parties lodging indignant suits in court. Legal expenses will be likely to decrease.

Of particular benefit to the companies is the rating system such a plan would call into existence. Far from being inadequate or excessive, rates would be current, actuarially sound, and adequate for a healthy company. Political pressures on such a rating system would be anywhere from nil to nonexistent. Furthermore, the advent of realistic rates should do much to improve insurance company solvency.

For agent and company alike, the plan—as modified by this committee—features stabilizing factors amidst the change. Perhaps the most reassuring of these is the requirement that companies offering Basic Protection must also offer liability insurance. This means, in effect, that large life and A & H carriers will not rush in and suddenly scoop up an enormous part of auto insurance.

Adoption of this plan will also open up and improve markets. We feel this is an important point, because the availability of affordable insurance is essential to any viable system.

In conclusion, we feel there is every good human and business reason to try this first party system. It should do the greatest amount of good for the largest number of people. While it is so serving the public, the system will still permit healthy profits for agents and companies.

We can not pretend that the adoption of such a system will not cause certain inconveniences and some dislocations. These are the inherent byproducts of healthy change. It is only the sick that a healthy change hurts.

There is no better demonstration of our conviction than the way we recommend the plan should be offered—*voluntarily*. Naturally, certain savings and gains in effectiveness could be realized by making such a plan compulsory—and thus universal.

We feel the plan will be so overwhelmingly popular with insureds, companies, agents, brokers and insurance departments that it will quickly come into universal use.

In conclusion, we invite the active support of all IMA members and others in our industry for this plan. It will take a fight against certain entrenched elements if such a plan is to be put into practice. But it is a fight that, *united*, we can win. It is a fight that, indeed, we must win.

ROBERT W. BAYLIS, Chairman
IMA Auto Study Committee

Senator HART. Not so much of the need for lunch but because of a need to get to the floor for the introduction of some legislation, I am compelled to take a recess. Those who are here and from whom we have not yet heard, all are busy and are operating, in all likelihood, under the pressure of airplane reservations. I will suggest a recess until 1:30 p.m., and if at all possible—if we are lucky we will be back 5 or 10 minutes before that but certainly not later than 1:30 p.m. p.m.

(Whereupon, at 12:36 p.m., the hearing was recessed, to reconvene at 1:30 p.m., this same day.)

AFTERNOON SESSION

Senator HART. The committee will be in order.

We resume this afternoon welcoming the director of insurance of the State of Illinois, Mr. James Baylor, who is accompanied by Mr. Vincent Vaccarello, chief deputy director.

Gentlemen, thank you for the material which you have provided the committee. We will make as a part of the files all of the documents.

First, we will print in full your prepared testimony. As you go along, make any comments you might wish.

STATEMENT OF JAMES BAYLOR, DIRECTOR OF INSURANCE, STATE OF ILLINOIS, CHICAGO, ILL.; ACCOMPANIED BY VINCENT VACCARELLO, CHIEF DEPUTY DIRECTOR, ILLINOIS DEPARTMENT OF INSURANCE

Mr. BAYLOR. When we came, Mr. Hart, we anticipated we were going to be accompanying Governor Ogilvie. We regret he is not here. We know he regrets he is not here. He asked us to deliver a letter, it is addressed to Senator Magnuson.

Senator HART. Thank you very much. I will see that the chairman gets it.

It is appropriate to make this part of the record?

Mr. BAYLOR. Yes; I think so. I think it does set forth the Governor's views on the matter and we think they are important.

Senator HART. Fine, let's print it at this point.

(The letter follows:)

STATE OF ILLINOIS,
OFFICE OF THE GOVERNOR,
Springfield, Ill., May 12, 1971.

HON. WARREN G. MAGNUSON,
Chairman,
Senate Commerce Commission,
Washington, D.C.

DEAR CHAIRMAN MAGNUSON: Last fall, I asked the Illinois Department of Insurance to make an extensive study of the auto reparations system in Illinois and to prepare recommendations for its improvement. *The Illinois Plan* for insurance reparations reform evolved from that study.

Although developed by the Illinois Department of Insurance independently of the Department of Transportation's Motor Vehicle Crash Losses Study, *The Illinois Plan* meets substantially the recommendations of that study. It is designed to help alleviate human anxiety, provide expanded benefits to accident victims, speed justice, reduce court backlog, and stabilize and possibly even reduce the spiraling cost of insurance.

I share Secretary Volpe's view that: "The experience of the States should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."

There is substantial evidence the experience in the various states is not sufficiently the same to require absolutely uniform auto reparations reform. Though it may be desirable for one state to adopt a program to meet its particular situation, that program may or may not meet the needs of the people of other states.

Some argue that reparations standards imposed by the federal government are essential to motivate states which otherwise would not act. However, those same standards easily could become a detriment to those states where action is being taken on the state's own initiative. All too often federal proposals become minimums for accomplishment, while at the same time they stifle new approaches.

I realize the good intentions manifested in federal action, but I believe that there is not sufficient justification for a federal program at this time. It was only six weeks ago that the final recommendations of the Department of Transportation's two-year auto reparations study were made public. States should be given an opportunity to examine the data contained in that study and to evaluate the recommendations.

We in Illinois already have developed a program for state insurance reparations reform and are working for the enactment of the legislation to implement that program. Other states are doing the same.

I regret that I am unable to be with you today. However, I have asked James Baylor, Director of Insurance, and Vincent B. Vaccarello, Chief Deputy Director of the Department of Insurance, to extend my remarks and to answer any questions that you may have.

Thank you.

Sincerely,

RICHARD B. OGILVIE, *Governor.*

MR. BAYLOR. In order to expedite matters, we have prepared a statement, and I would like to read it.

The Department of Insurance in Illinois is well aware of the condition of the automobile reparations system as it relates to the situation of Illinois automobile accident victims. Becoming informed through a study initiated by Governor Ogilvie, we have promulgated a program of reform—a change of that system to bring relief to that situation.

The fact is that in Illinois, and I believe other States, the leaders of government are going forward on all fronts to reduce the occurrence of auto accidents and to bring relief to their effects. Accident reparation is only one phase of that overall, coordinated program of action. We through our office and other government offices, are in constant contact with the people of our State. Thereby, we, more than others, can discern their attitude toward the efforts made to remedy their problem.

We have developed the Illinois plan, for which implementing legislation is before the Illinois General Assembly. It is a comprehensive approach to correct the deficiencies in the reparations system of our State as does no other proposal. Basic to it is the realization that the concept of tort liability is not fundamental to those deficiencies. They are a product of the administration of the reparations system. Our only goal in every consideration was to overcome the deficiencies. To the extent they lay in inadequate benefits, we would extend those benefits; to the extent they lay in the judicial process, we would streamline the procedures.

The Illinois plan will remove the reason to sue, not the right to sue. To do otherwise does not satisfy the needs nor meet the attitudes of the people of our State. The present reparations system is a product of individual State action on individual State initiative. Because it is not doing the job in Illinois that we believe it can and should

do is not a reason for changing the promulgating authority. It merely means that Illinois must get on with the job—and that, we are doing.

The States are capable of recognizing and providing for the needs of their peoples regarding reparations. The present system created by the States and the variations developed within the States reflect that ability to continue to do so. That Nebraska, Wisconsin, and other States provide for comparative negligence in contrast to Illinois, which is a contributory negligence State, indicates further the ability of the States to exercise judgment and do what their elected officials believe is best for them. Who, not responsible to the people of Illinois, could presume to decide their needs, much less dictate their satisfaction?

Particularly, is it important to retain a multi-State auto reparations system to avoid the disadvantages that would be inevitable if we had only one inflexible, uniform Federal program. Obviously there are some short-term advantages to uniformity. But the long-range inhibiting effects against change to obtain improvement, as that will become needed, are gross by comparison.

On a national basis, the differences between the States is not a deficiency of the whole reparations system. In practice, the differences are one of its strengths. Only where differences exist can realistic judgment be exercised to obtain improvement. Only when proposed changes can be evaluated in practice can they be established as advantageous and sound. Solely through action on a State-by-State basis is this possible. We have learned much by the action of Massachusetts in the reform of its reparations system. We believe they and others will learn much by the action we are taking in Illinois.

It is imperative to realize that the deficiencies of the present system are not the result of the actions of the individual States but the product of changes in the circumstances to which those actions apply. If it were true that the deficiencies are a result of Government action—or inaction—nonetheless would it be true, were the reparations system a function of the Federal Government rather than the several States.

We do not acknowledge a need for national standards for a reparations system on a State-by-State basis. Again in the short term there might be some advantages. The establishment of national standards might be an incentive or prod to action in some States that need to but otherwise would not respond. But also in the short term, national standards would, not might, have an inhibiting effect on the States which will accomplish their needs without them. National standards would set the minimum of accomplishment. And when they have been met, apathy at both the National and State level would destroy any attempt at innovation or improvement. Legislators, in whatever legislative body, know that apathy and the pressures against change are the strongest forces they must overcome. To add to that the limitation inherent in the existence of national standards could be disastrous to obtain improvements to meet the changing conditions of tomorrow and all the tomorrows to come.

While it is true that significant change in any institution under government is slow in the minds of its proponents, necessarily—and fortunately—is this so. Two points are particularly important:

First, there must be a realization that nonaction by the States in some instances describes a positive, not negative, attitude. There are

those who support a Federal reparations system only on the grounds the States will not act. The fact is that the circumstances that require change in States such as Illinois do not exist in some other parts of this Nation. That the cancer might develop is no reason to cut off the leg in anticipation to prevent its happening. I believe it would be a breach of faith to the people who elected Members to this Congress if the authority of the Federal Government were to impose on them a system not consistent with their needs merely because some States determined not to take action. And some apologists for a Federal system offer as proof that they proposed a reparations plan and "it died in committee." The only proper interpretation, I believe—rather than impugning the motives or integrity of the State legislators—is that by the nonadoption of the proposal before it, the enlightened State legislature was rejecting that as an acceptable solution or means of relief to the problem. Rejection as well as adoption should be regarded as positive action; the legislatures have recognized the inherent inadequacies in the arguments for those types of plans. It is no valid criticism of the Illinois plan that it does not meet the criteria that only its critics have established as the basis for an acceptable program.

Second, the recognition of the problem is evolutionary and the solutions for it must be sought out, a time-consuming process. The occurrence of divine revelation in such mundane matters as auto reparations is infrequent at best. In Illinois and in other States these changes are in the process of accomplishment. The DOT studies have been one of the greatest assets to all interested in obtaining relief to the problems; but their being the accomplishment of a Federal agency is no argument for Federal legislation as the remedy to the problems they identify.

In Illinois, and in other States, I believe, there is recognition among the public of the matters we are discussing here today. It is obvious that substantial effort is being made by all interested parties—the several branches of government, including the bar; the news media, not only in its reporting of the news but also in its editorial position; the insurance industry, which did not create the reparations system but works within it; and the consumer groups—to effect significant change to reach the same goals which will be obtained by the enactment of the Illinois plan.

One important point, as I read the reports of proceedings before the Congress in these matters, has not received the analysis it deserves: what the reparations system is. Basically it has two parts: (1) the determination of who should recover damages, how he would recover them, and in what amounts; (2) the resources for the recovery of those damages. They are two separate things yet so closely interwoven as to be one—the reparations system. If either becomes the object of the jurisdiction of the Federal Government, inevitably will become the other also. To expect that the Federal Government can control through Congress the first part of the reparations system while the States will regulate the second is to anticipate we have learned to unscramble the egg. If it is the purpose of Congress to assume regulation on the insurance industry, let that be proposed as such rather than let it occur as the inevitable result of a Federal reparations system.

We urge your recognition that Illinois, as a leader among States, typifies what can and will be done by all the States in the field of auto reparations; that at neither this time nor in the foreseeable future is there any reason for the Federal Government to preempt the field from the States nor to intercede through a program of Federal standards; that to do so would be unwarranted interference with what the States are more capable of doing and will do best for their respective citizens.

In support of some of these comments I have made, Senator Hart, we have included some of the materials in this booklet that you indicated earlier would be made part of the record, and I call them to your attention, if I may. We have included quite a collection—I don't know the number of pages, but it seems to be 10 or 12 at least—of editorial comments from the news media in Illinois, and every one of these comments has been strong in its support of the Illinois plan as the vehicle by which to bring relief to the problems of our Illinois citizens.

We have referred extensively here to the Illinois plan. The booklet here, the yellow booklet, goes into it extensively. Mr. Vaccarello, who was primarily the draftsman for the plan within the Department of Insurance, frankly, I think it could best be said that it was his genius that put together the elements which make up the Illinois plan, and I would like him to at least comment to you on these rather than ask you to read the whole book.

Mr. VACCARELLO. Senator, the plan which we have developed in Illinois, after a considerable amount of research, provides an equitable program for reform with respect to the deficiencies which have led to criticisms of the present auto reparations system.

The Illinois plan requires Illinois auto insurance companies to promptly pay every 30 days, and without regard to fault, up to \$2,000 in medical benefits covering the span of 1 year, up to 85 percent of wage losses to a maximum of \$150 per week for a period of 1 year, and over \$4,000 for reimbursement of essential services, to all victims including pedestrians, on a first-party basis.

Our study of claims in Illinois demonstrate that 99 percent of the injured victims of automobile accidents in our State have under \$2,000 of medical expense, while 99.8 percent of injured victims have less than \$7,800 in wage losses. Thus, the Illinois plan would provide broad and comprehensive no-fault first-party coverages for an extremely large majority of injured Illinois victims.

However, the plan does not end there. The Illinois plan further provides that all insurers must also offer an additional aggregate of \$50,000 of coverage to each policy holder on a no-fault excess basis. This excess coverage would extend the medical benefits and wage loss for 5 years, service loss benefits for 5 years, and provide dependent survivors benefits for a period of 5 years.

Our approach in this area is unique for another reason. The excess loss coverage can be purchased in Illinois under our provisions, instead of the currently mandatory uninsured motorist coverage. The contrast is dramatic for this reason: the uninsured motorist coverage which all Illinois motorists must now purchase pays up to \$10,000 per person per accident; however, only in the event the person is injured by an uninsured vehicle and, secondly, only in the event that liability is

established. However, under the excess coverage which we are substituting for this, the excess coverage would pay up to \$100,000 per accident, \$50,000 per person for every injury incurred by an insured motorist, and whether or not there was liability on the part of the wrongdoer.

Despite all of these accomplishments within the plan, the plan does not deprive any person of his present right to sue. However, through the prompt payment of economic losses, both the need and the reason to sue are dramatically reduced, if not eliminated, in the vast majority of cases.

Secondly, the initiative to sue, to exaggerate, and to fraudulently concoct claims on the part of both claimants and lawyers is lost through a limitation on the amount of pain and suffering awards which can be obtained in those cases where there is no serious injury.

In this fashion the plan meets the demonstrated deficiencies in this system while eliminating waste, and it promptly returns the savings to our policyholders in the form of needed benefits at a time when they need them the most.

It deals with remedies to the deficiencies in the system rather than abandoning or seriously and irreversibly altering that system. The heart of the Illinois plan lies in its abilities to offer these remedies without abandoning the rights of an individual. If we remove the need to sue, we do not have to drastically eliminate or alter the right to sue; and by starting with this flexibility we do not become irreversibly committed to the abandonment of a basically sound and just system. the system of justice through the right to a trial.

Even more significant and dramatic is the fact that all of the remedies, together with the preservation of rights, can be effectively and economically accomplished. I would like to point out here that some observations have been made concerning the Illinois plan and concerning the manner and the method by which it eliminates the incentive to sue.

In the Illinois plan we have a system where all of the benefits which are available to a plaintiff may not again be recovered in the event of any cause of action. Consequently, any benefits not only paid to him but recovered or available to him are deducted from the award. If the amount of the award is limited, such as we propose in the plan, then the incentive and the jackpot urge to sue are eliminated.

I would like to add, if I might, Senator, in addition to the statements which Director Baylor has made regarding the support which the plan has received—and if we might off this for the record since we received it this morning. It is a press release from the Illinois Defense Counsel, a group of some 350 of the more prominent attorneys in the State of Illinois. The board of directors of that association has unequivocally endorsed the Illinois plan for automobile reparation reform and stands fully ready, willing and able to do whatever is necessary to have that enacted into law.

Senator HART. Gentlemen, thank you. Thank you first for the depth of the presentation as reflected in the materials you have given us, and the useful summary of your position.

As you have described the Illinois plan and to the extent I understand it, I would think it would be an improvement over the existing

system, and I would agree with the director's statement that divine revelation is not claimed by—I hope—not claimed by anybody.

But I have the concern that while the Illinois plan would represent the improvement that you have described, it would be at a considerable increase in cost to the buyers of that insurance. Now, improvements often come with the cost that reflects improved quality and the satisfaction, but the test is whether the same improvements could be obtained with a lesser cost to the buyer.

Mr. VACCARELLO. Senator, our studies have demonstrated that the Illinois plan can be enacted into legislation and the first-party benefits—no-fault benefits made available to current policyholders in the State of Illinois at no general additional cost whatsoever, and if the plan succeeds—and I hate to use the word “if,” but I have been told many times in the past not to be too presumptuous—but if the plan succeeds as we anticipate it will, there should be considerable savings.

I would like to point out, for example, one case which we studied and one alone as an example of that. At the present time, in the State of Illinois, with a minor back sprain in a rear end collision, an average medical bill of \$200, average lost wages of \$300, and total specials of \$500, the settlement average is \$1,500. That breaks down as \$500 in reimbursement of the specials, \$1,000 as pain and suffering.

The distribution, ordinarily, in the average case, is \$200 to the doctor, \$500 to the lawyer, and \$800 to the client. But the cost to the system is greater than the \$1,500 alone. The costs to the system include the additional \$200 paid by the first-party carrier for the medical bills of the claimant, so that we have a total cost to the system of \$1,700 simply in terms of money which changes hands.

Under the Illinois plan the medical bill of \$200 would be paid by the first-party carrier. The lost wages of \$300 would be paid by the first-party carrier. The claimant would still have the right to make a claim for \$100 in pain and suffering, which we do not believe he will make.

Our studies demonstrate when we checked out the collision deductibles, for example, that even in those cases, Senator, where a person had lost \$100 out of his pocket, the claim for the deductible was almost never pressed. Using this as an analogy, I would say when the claimant has been paid his out-of-pocket completely and has only a maximum of \$100 which he could recover, that he is not going to press that, either. But, nevertheless, if he is paid, we are talking about \$600 and an \$1,100 savings on that one average case alone.

Not only is it a savings in terms of the money which changes hands, it is a saving, also, in claims administration costs. It is a savings in personnel. It is a savings in litigation investigation. It is a savings with respect to the judicial system. And I would submit further that we probably would not be paying \$200 in medical or \$800 in lost wages under the Illinois plan because at the present time today, with the deficiencies that exist in the system and with the often heard demand, “You are not even giving me three times specials,” we known that the amount of the ultimate settlement is geared to the specials and, consequently, the incentive exists to build the medical specials and the lost wages. Now, there is no incentive to build under the Illinois plan. There is no need to build. There is no motivation, no encouragement. Consequently, I would submit that the medical bill will be \$50 instead of \$200 in that case, and that the lost wages might be perhaps \$50 or maybe

nothing, because there is no jackpot at the end of the rainbow anymore. If he goes to court and sues and he can only collect 50 percent of his medical bill as the total amount of his award, I would submit that there are not too many lawyers that would handle the case, not for a \$33 fee or even a \$100 fee.

Senator HART. I think it would be useful, and I would ask Mr. Sutcliffe to develop as well as we can here—to the extent questions may be asked which would require some homework for you to provide for the record—to nail down the degree to which there is basis for this suggestion of yours, and I think we have given you some tables that Mr. Sutcliffe will use to discuss it.

Rather than holding it for the conclusion of his questions, I would ask the director to comment on a study that he has already commented on generally, namely, the Volpe Department of Transportation study. Much of your testimony counsels against the application of either national standards or national law. I would ask you to react to this next sentence.

My impression is that it is only a question of degree, State by State, in the inadequacies and failures of the existing system. I think that in all 50 States we could make a case that, as you discovered in Illinois when you made your analysis, there is much that should be improved.

Now, the final report of the Department of Transportation has this comment on page 141:

Ultimately, the systems of the several States must be compatible. Although there are means available to overcome great diversity, these are cumbersome and a reasonable degree of national uniformity seems best for a number of reasons. Since motor vehicle travel in interstate activity is of major proportions, minimum standards for accident reparations involving all the motoring public, wherever they travel, would constitute sound public policy. If the basic reparation system would be left to individual State initiative without some encouragement and guidance and, at least in an advisory sense, the direction on a national perspective, meaningful change might be exceedingly slow in coming.

Mr. BAYLOR. I think what Secretary Volpe is talking about there is guidelines as I distinguish that from standards. Further, I think when he talks about compatibility, we think that there can be compatibility. For instance, we think the Illinois plan would certainly have compatibility with the Massachusetts plan. We think that the Massachusetts plan does not serve our citizens, but if Massachusetts thinks it serves theirs, fine.

For instance, we do not provide for deductibles or waiting periods. We think a system that offers a man a chance to have a \$2,000 deductible in an effort to reduce his premium, and then he has an accident, which in Illinois, according to our statistics, his economic loss would not even reach the deductible that he had chosen. After all, Massachusetts developed a system that does not—and they have changed everything to take care of a situation where the man himself will not obtain a recovery. Well, if Massachusetts wants to do that and if they think that is for their best interests, fine. But we did not think it would work for Illinois.

Now, after this is done, we hope Massachusetts—or we anticipate Massachusetts will recognize the benefit in the system we have chosen. But think how bad it would have been if we had a Federal system which adopted the Massachusetts approach and then applied that to Illinois where we think it is not a useful thing. This is the type of thing I am talking about.

Mr. VACCARELLO. Senator, if I might add, interestingly enough, during the 7 months which I spent working on this, I had reached the stage on several occasions where I thought we had some rather good remedies, and I discussed some of these approaches with members of the bar in Chicago, and they felt that these appeared to be good approaches. I then had meetings with downstate lawyers and found out that they did not feel these were good approaches because they did not address themselves to problems which existed downstate.

Illinois has a tremendous heavily industrialized area north, and many of our people to the south are farmers. In the north they have other benefits. In the south they have not. Consequently, we found ourselves facing perhaps somewhat the same situation in one State that exists on a State-by-State level, but we did feel that we could come up with remedies here and we feel we have provided what should work.

Senator HART. If your can recall, what specifically did you think tentatively to be a good plan and which the Chicago bar thought to be a good plan and then you discovered maybe it would not work downstate?

Mr. VACCARELLO. I will give you two examples. One is arbitration. We have provided in our plan for a system of mandatory arbitration in order to eliminate court congestion or reduce the backlog so our judges in Illinois can re-establish their priorities to more adequately handle other judicial demands. Downstate, in many of the counties, there is no backlog problem. You can go to trial as soon as you want. Consequently, when we attempted to put in a mandatory arbitration, it would have established a system on top of a system without the need, and was subject to a great deal of criticism.

Another is the matter of collateral benefits. In some States and some areas of our State people have a great deal of protection outside of the motoring insurance system. In other parts of our State, involving equally as large a number of our people, they have no such other protection.

These are two of the differences that just immediately pop into my mind.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Thank you, Senator.

At this point, perhaps, in the record, we could insert these two charts that we will be talking about if we may.

Senator HART. Yes, I would.

(The charts follow:)

BENEFIT INCREASE PROJECTED

(Amount in billions)

| | 51 | | | 52 | | |
|-------------------------------------|------|------|------|------|------|------|
| | 1955 | 1965 | 1970 | 1955 | 1965 | 1970 |
| Net benefits paid..... | 2.8 | | | 4.4 | | |
| Compensable economic loss..... | 5.1 | | | 5.1 | | |
| Percent of loss paid..... | 55 | | | 85 | | |
| Percent paid for economic loss..... | 2.8 | | | 4.4 | | |

1 Modified to include property damage in the 1955 figure.

2 Benefits paid, less benefits for pain and suffering, compared to compensable economic loss.

3 Based on nationwide estimate of 51 percent of benefits paid are for compensation of pain and suffering.

[In billions]

| | 1970 | S. 945 ¹ | Ogilvie plan |
|---|------|---------------------|--------------|
| Insurance overhead | 5.5 | | |
| Selling costs | | | |
| Claims: | | | |
| Investigation | | | |
| Processing | | | |
| Payment | | | |
| Other: | | | |
| Actuarial costs | | | |
| Regulatory costs | | | |
| Lawyers fees and other litigation costs | 1.5 | | |
| Defense costs | | | |
| Plaintiff costs | | | |
| Limitation on pain and suffering recovery | | | |

¹ Modified to include property damage on a first party basis.

Mr. SUTCLIFFE. This would be the "Cost of Benefit Delivery" chart and the "Benefits Increase Projected" chart. Now, these charts are simply to serve as a guide for discussion to be able to ascertain your impression about costs. The figures that are presented in summary form are from the Department of Transportation study as updated to 1970.

Mr. VACCARELLO. Which chart are you referring to?

Mr. SUTCLIFFE. This would be the figures that are actually filled in on both charts. We have blank places and the ones that are filled in are from updated figures provided by *Best's Aggregates and Averages*, 1970 edition, that have just become available.

Now, I understand that it is your assertion that the present gap in the automobile compensation system related particularly to bodily injury which pays in benefits \$2.8 billion of the \$6.5 billion of loss would be about 99 percent corrected under the Illinois plan because of the mandating of first party no fault coverages, and that that increase in benefits could be paid for through resulting savings that you make in the liability system which you preserve. Is that a fair statement?

Mr. VACCARELLO. Yes, it is.

Mr. SUTCLIFFE. Now, to understand as best we can these statements, let me go through the chart with you, not asking you to fill in specific dollar amounts at this point, but asking you to fill in specific dollar amounts or approximations to the best extent you can for the record following these hearings. At this point, simply indicate plus or minus, indicating an increase in cost under your plan and under a plan similar to the one proposed in S. 945, and we will stick to the bodily injury area at this point.

Mr. VACCARELLO. These are strictly actuarial computations, are they not, these computations?

Mr. SUTCLIFFE. These computations are really what the present system is.

Mr. BAYLOR. Is this Illinois, by the way, or nationwide?

Mr. SUTCLIFFE. This would be nationwide for the total picture, and if you think there is a significant disparity between the ratios of these figures to Illinois, point that out. We do not have to do that at this point. What I wanted to do at this point is to see whether you think there will be a price savings or an increased cost because of the plan and a brief explanation of why you think there will be a savings or an increase.

Let me start with insurance overhead, which is one of the places that you are going to try to save money, I would imagine, through the institution of your no-fault benefit system.

Now, do you believe that selling costs will go up or down under the Olgvie plan?

Mr. BAYLOR. I do not have any real opinion on that. Without regard to—I know this is getting off the subject of what you want—you are talking about costs. But we think one of the significant features of this plan is that by having a stabilization of insurance benefits, we are going to increase the availability. Now, availability and price are two very significant problems of the same problem, which is the market; but at least I do not have any opinion as to whether the selling costs would go up or down.

Mr. SUTCLIFFE. By selling costs, I mean those costs of marketing the product, not what the cost of the product is; because if we have already supposed at least on an overall basis it will stay the same or decrease because we are paying for increased benefits out of savings within the system itself.

Mr. BAYLOR. I do not think there is going to be any significant change in the selling cost, that I am aware of offhand.

Mr. SUTCLIFFE. You think it would be a constant. OK. Under S. 945 of the legislation before this committee, do you project an increase, decrease, or a constant as far as selling costs?

Mr. VACCARELLO. We have not made a study, either an actuarial or a management or administrative study, of the costs involved in S. 945.

Mr. SUTCLIFFE. Then from here on out we will only treat of the Olgvie plan. I thought in your 7-month study you may have been able to analyze some of the costs in the other studies. If you could provide that information for the record it would be appreciated.

Mr. BAYLOR. I think we can. Mr. Lewis Roberts is going to be testifying in Springfield on Monday to our Illinois State Senate Committee which is considering this. He has very extensive actuarial studies and he is really the person responsible for developing an awful lot of this information, and I am sure we can get the kind of information you are talking about more readily from him. We can make some guesses on it.

Mr. SUTCLIFFE. Let's try for the guess. As far as claims investigation, will that cost increase or decrease?

Mr. VACCARELLO. Decrease significantly.

Mr. SUTCLIFFE. On what basis?

Mr. VACCARELLO. On the basis that you will hardly need any investigation to speak of.

Mr. SUTCLIFFE. What about the uninsured subrogation procedure? How will the companies determine which parties are at fault?

Mr. VACCARELLO. There is no significant amount of money involved in subrogation procedures against uninsured motorists.

Mr. SUTCLIFFE. I am not talking about the money involved or subrogation under uninsured motorists. In the first party benefit payment, in order to preserve the rating system as explained by Mr. Kemper previously, the insurers will get together and decide who was at fault. Now, you say there will be a significant savings in claims investigation. If fault has to be determined, where will that savings originate?

Mr. VACCARELLO. Where you have a situation where you are dealing with a liquidated amount, which is the case in the large majority of claims under the Illinois plan which do not involve permanency, you do not have the prospect of facing an injury verdict of \$1,000 to \$5,000. I mean, you are dealing with a liquidated claim just as you are in a property damage claim. You have so much damage and so much which is recoverable and that is it.

I am sure, as you know, most of the property damage claims are handled on a very inexpensive basis with a minimal amount of investigation. They are handled primarily by statements from the policy holder which would be required in any type of claim under any type of system, and perhaps a police report if there is a question as to liability.

Mr. SUTCLIFFE. But to the extent that you still are determining fault, would it be a fair statement to say that if claims investigation costs would decrease dramatically, in a situation where the causation aspects of the accident do not have to be investigated, that there would even be a further decrease in investigation costs?

Mr. VACCARELLO. You are talking about under our plan?

Mr. SUTCLIFFE. We are trying to weigh alternatives, as Senator Hart has suggested. Let's just take a plan that did not require the ascertaining of fault, either between insurers or in the tort suit context.

Mr. VACCARELLO. Does your plan not ascertain the determination of fault? Is not the concept reserved where there is permanency? So you would have to investigate whether or not there is any permanency also, and you would have to investigate the liability.

Mr. SUTCLIFFE. Yes, but in a narrower category than under your bill. I am simply trying to get an ascertainment of cost differentials.

Mr. VACCARELLO. I do not know what the cost differentials would be comparing your bill to the Illinois plan. However, I can say that under the Illinois plan a major portion of the investigation costs, the claims processing costs, the administrative costs, the litigation costs would be eliminated, no question in my mind whatsoever.

Mr. SUTCLIFFE. Then if you could, on the basis of using this chart and your reductions in all of the claims and procedures, provide us with an explanation and any guesses you have as to how much—since you must have some guesses if you concluded that savings within this portion would help pay for any increase in benefits that would be paid.

Now, as to lawyers' fees and litigation costs, you can see at the present time it is \$1.5 billion.

Mr. VACCARELLO. How about actuarial and regulatory costs?

Mr. SUTCLIFFE. I think, if you would provide those for the record—I would assume you do not have any exact figures on this.

Mr. VACCARELLO. There are savings there, also.

Mr. SUTCLIFFE. You would indicate a savings in actuarial and regulatory costs, perhaps the selling cost no change—or you will provide that for the record—for investigation, claims processing, administrative costs, and payment of claims for other costs such as actuarial costs and regulatory costs, also you would project a decrease.

Mr. VACCARELLO. Right, because you are dealing with actual and liquidated items rather than projected possible or probable costs.

Insofar as regulation, I would suspect a tremendous savings at least in one area. At the present time we investigate companies to determine their respective solidity; that is, to see their financial condition. To a large extent, their financial condition is dependent upon the accuracy

of their claims reserves. Under a system which proposes that a majority of claims be handled out of immediate payment basis, there is no 4- or 5-year delay, no buildup of reserves, no change in the amount of liabilities, and so forth.

Mr. SUTCLIFFE. So this would be very beneficial to the solvency situation in Illinois?

Mr. VACCARELLO. Yes.

Mr. BAYLOR. There is another element in this, and that is processing of complaints. Whenever you have this give-and-take of who is at fault it gets terribly subjective. I suppose we process some 25,000 complaints a year in our department, and to a great extent these arise out of these liability cases, and we think that when you diminish the liability problem and you reduce the damages up to a liquidated basis we are going to be able to save a substantial portion of that complaint field. But again, it is not going to be the kind of money that is going to make much of a change in the Illinois State budget, I will tell you that, much less the Federal.

Mr. SUTCLIFFE. So you are certainly, through limitations that you build into the tort concept—although you have not in any way legally built in limitations on the tort concept—you are going to effectuate a considerable amount of savings in your plan?

Mr. BAYLOR. Yes.

Mr. SUTCLIFFE. Perhaps you could provide then, out of the \$1.5 billion that we are presently spending for lawyers fees and other litigation costs, what your approximate guesses as to reductions would be for defense costs, plaintiffs costs and other litigation expenses—court expenses and so forth.

Mr. BAYLOR. I think that is terribly important because there is not only the actual cost that goes into this litigation expense, but there is this taxpayers' cost to maintain the system, and I think that they are undoubtedly implicit in the S. 945, the idea that we are not going to carry on these tremendous governmental structures to process claims, which is what the court process is frequently. \$250 an hour is what Ben Mackow says it costs to run the Cook County court. We anticipate some tremendous savings on the Cook County system alone, just on that basis alone, which is not in here but we will send it in to you.

Mr. SUTCLIFFE. Also, if you could provide for the record an explanation—explain how those savings will result, even though you, theoretically at least, are preserving the tort liability system intact.

Mr. VACCARELLO. Well, I can give you several ways right now in which they will result. For example, not all insurers in Illinois today belong to a mandatory intercompany arbitration, binding arbitration. This is outside of the judicial system. Consequently, a significant amount of money is spent to subrogate. Lawyers are hired and so forth.

Now, under the Illinois plan, these are handled outside of the judicial system without attorneys. Any claim by an insurance company against another insurance company, they have to settle it between themselves.

Mr. SUTCLIFFE. This is where in your prepared statement you used an expression "knock for a knock."

Mr. VACCARELLO. No. "Knock for knock" is a complete and total abandonment of the right of one company to obtain reimbursement from another company.

Mr. SUTCLIFFE. But in essence, when you have offsetting claims, is that where you do not even have to use the arbitration process?

Mr. VACCARELLO. Right. Companies are free to engage in that if they feel that one offsets the other, yes. But what I am talking about is under the present system, if I pay collision damages and I attempt to subrogate, I have to hire a lawyer and I have to go to court. Under the Illinois plan, I do not have to hire a lawyer and I do not have to go to court. The same girl who handled the property damage file of the collision loss goes to the photostat machine and makes a copy of the file and sends it in to the private system of intercompany arbitration and a few weeks later some decision will be forthcoming. So we have a tremendous savings there alone.

The judicial arbitration versus the current court system provides a dramatic example of savings. I think they estimated in Philadelphia that the average cost per case disposed of under judicial arbitration, supervised arbitration, is \$65 to \$70, whereas the director testified—I do not know if Mr. Mackow was here before this committee—but the court in Cook County spends \$250 an hour, and I do not know of any case they have disposed of in 1 hour.

Mr. SUTCLIFFE. Mr. Mackow also pointed out that the courtroom is not really used for litigation but for a forum of settlement.

Under your particular plan with the tort system preserved, you suggest that it would not be worth a lawyer's time to pursue a tort claim in the low amounts that you have described. Because of your limitations on pain and suffering awards, his recovery would not be significant.

Now, is this true even if you go through the settlement process? In other words, what I am asking you, I think a lot of claims at the lower end of the spectrum are bought up right now because it is cheaper for insurance companies to buy them up than it is to confront the possibility of litigation. Under your plan, will you provide us with information as to why that cost will be significantly reduced—why that settlement cost would be significantly reduced?

Mr. VACCARELLO. All right.

Mr. SUTCLIFFE. You can do this for the record. I think it would probably be best if you do this for the record.

(The following information was subsequently received for the record:)

BENEFIT INCREASE PROJECTED, ILLINOIS¹

[In percent allocation of B.I. premium dollar]

| | 1970 | Illinois plan |
|---|------|---------------|
| Acquisition costs..... | 18 | 13 |
| Company expense..... | 16 | 16 |
| General damages..... | 25 | 15 |
| Economic loss (medical, lost wage, etc.)..... | 17 | 39 |
| Litigation expense..... | 24 | 8 |
| Total..... | 100 | 96 |
| Remainder..... | | 4 |

¹ These are pure actuarial projections of the manner in which the B.I. premium dollar currently paid will be re-allocated under the Illinois Plan, and do not include savings in management, administration of claims, etc.

² These costs should be reduced due to the change in claims handling procedures resulting from intercompany arbitration, judicially supervised arbitration of small claims, elimination of unliquidated damage claims for pain and suffering in cases where there is no permanent disability, etc.

Note: Savings should also be realized in medical payments coverages through the elimination of the incentive to "bill" medicals to support a B.I. settlement demand.

Mr. VACCARELLO. All right.

Mr. SUTCLIFFE. As you can see, the last item on that chart is the limitation on pain and suffering recovery and what the cost savings is. If you could give us some approximation of what cost savings you anticipate on the limitations on pain and suffering recovery where you have 50 percent for under \$500 and 100 percent for over \$500 with the category of catastrophic categories where there is no formal limitation—

Mr. BAYLOR. We will do that.

Mr. SUTCLIFFE. Turning to the benefit increase projected chart for just a moment—and again, since you have not had an opportunity to study the implications of the bill set up like S. 945, we will discuss it simply in terms of the Illinois plan and assume that the Illinois plan is operating nationally or break it out, if you have the Illinois figure. The net benefits paid right now are \$2.8 billion; compensable economic loss, \$6.5 billion. Please explain where, under the Illinois plan, you think you will get to, in other words, in terms of the net benefits paid and the compensable economic loss suffered, percent of loss paid, and then what percent of that loss paid is reflected by economic loss alone rather than a combination of economic loss and pain and suffering.

As you can see, under the present system we do pay \$2.8 billion in benefits to cover economic loss of \$6.5 billion, or 43 percent, but we have learned that of that 43 percent, 60 percent of that is for pain and suffering, not for compensation of economic loss. So we really have an economic loss compensation of only 18 percent, and these, again, are approximations based upon information that has been provided us. So if you could simply fill in that chart for us.

I guess the question has to be asked is this: If you have not had an opportunity to evaluate the cost implications of S. 945, I think the question has to be posed—how can you be certain that the Ogilvie plan is the most cost-effective plan for the State of Illinois?

Mr. BAYLOR. I think it is important in our consideration of this whole thing has not been just costs, has not been just benefits. A Cadillac costs an awful lot more than a Chevy Impala, but it does not necessarily mean it is a better or less car. I think you have to put all the different priorities into it to determine whether the cost—maybe the cost of our program does not go down as much as the cost would go down under S. 945, but the benefits obtainable under our program are greater, and in the sense of priorities of the people of Illinois they would rather have the benefits without that ultimate saving in cost.

Mr. SUTCLIFFE. Let me address myself to that point then, so we can understand one another. We have projected—and it has been verified subject always to unverification, if I can use that word—that the compensable economic loss suffered in this country would be paid up to 99.6 percent under S. 945. Your projections for your plan were 99 percent. That is coverage of economic loss.

Now, we have limitations on pain and suffering benefits that in some respects parallel yours in the catastrophic area; and in another area, we do not allow for pain and suffering recovery at the lower end of the spectrum. So, to that extent, we have constricted benefits more than the benefits you have used. But as far as other advantages

of your system, such as preserving the present rate mechanism, you could still adopt S. 945 and simply allow for inter-insurer subrogation if you wanted to maintain the present rating procedure.

So I think it is important to understand why Illinois has elected and felt that in its policy decisions it is important to preserve that area of benefit for pain and suffering which might have a higher cost, and if you could present that kind of reasoning to the committee to explain why that higher cost may have been preserved, on what basis, then it would be very, very helpful to us in our examination of this problem.

Mr. BAYLOR. Excellent. And I think we can tell you a lot about the factors that went into it. One of the reasons that I emphasized in my written presentation—I talked a little bit about the attitudes of people, and I think the attitudes of people in Illinois are important. We realize certainly that when a program to eliminate the right to sue was presented to the State legislature, the so-called Connell-Keaton program, Mr. Sariano—Representative Sariano did not get to first base. He was criticized severely by the newspapers. They did not like it, and the reaction of the public was not favorable.

We did not eliminate that right to sue and we obtained much encouragement from the newspapers. So I think it is important to consider the attitudes of the people as well as the dollar effects of it.

Mr. VACCARELLO. I think one principle that I would like to add is this. Our approach is studying this was to ask ourselves whether or not we could deal with what had been demonstrated to us as deficiencies which led to criticisms of this system, and we sought to remedy those deficiencies and not necessarily abandon the system. In other words, take care of the symptoms and the problem, not merely the symptoms.

Mr. SUTCLIFFE. But, in essence, you have told us that you are, for the most part, abandoning the tort liability system, in practice if not in theory.

Mr. VACCARELLO. We sought to eliminate the encouragement that existed within the system to build up claims, to exaggerate claims, what I like to refer to as eliminating the jackpot urge motivation, so to speak, and I would offer to you as a parallel the deductibles under the collision system again, that where a person has collision insurance and he has a deductible he seldom reverts, if ever, to the judicial system to collect his deductible, and yet that deductible comes straight out of his pocket.

Now, if a significant number of cases are of the type where if he went to court he could not collect more than \$100 if he wanted to, what would compel him to go to court? What would compel him to hire a lawyer and what would make anyone think he could find a lawyer who would take the case? If you could go to court and only collect \$100, \$200, \$300, who would take the case? Now we are talking not about out-of-pocket loss; we are talking about, if I might use the word loosely, the profit over and above his economic loss for which he has been compensated.

Mr. SUTCLIFFE. Well, why do you have to go through such a tortuous process to do this? Why can you not just say compensate him for his economic loss?

Mr. VACCARELLO. Why do we have to eliminate his—

Mr. SUTCLIFFE. You have, in effect, told him that you have eliminated his right, not legally but in practice.

Mr. BAYLOR. I think the people of Illinois attitude is such that—"Don't mess with our rights. We may not choose to exercise them, but our rights are not to be taken away by your judgment. Let us decide whether we want to exercise the right."

Mr. SUTCLIFFE. But by your plan you have said that that judgment, because of economic considerations, will always have to be in the negative at this lower end.

Mr. BAYLOR. No. I think we misspoke if we indicated it would always have to be in the negative. There are a variety of reasons that people might want to bring an action. We do not say that always—

Mr. SUTCLIFFE. But then you have got your cost problems again if, in fact, it is going to permit this litigation. Then your cost savings that you projected are not valid.

Mr. BAYLOR. Mr. Sutcliffe, the problem that we have developed out of the administration of this tremendous burden that has been put upon a system that was never designed to carry the load, but we did not have any problems until the burden got to be so great. I cannot quote you statistics. Illinois has had the problem for a long time, I will admit, but we have not had this serious problem for that long a time.

Mr. SUTCLIFFE. Well, I certainly appreciate your comments and we will look forward to the study of the cost information you can provide the committee and the information explaining the decisions which caused you to offer this particular plan. I think this will be very helpful to our understanding of what has transpired.

Mr. BAYLOR. The other thing I did want to mention, you see, we have changed the system a little bit, too. That provision for arbitration is significant to the cost factor as differentiated from having to process that right through a court system.

Mr. SUTCLIFFE. Except perhaps in downstate Illinois.

Mr. BAYLOR. Well, they do not have that major a cost problem in downstate Illinois.

Mr. VACCARELLO. You mentioned costs, Mr. Sutcliffe, and I would just like to point this out, that you know you can reduce the cost by, let's say, building in a deductible, right?

Mr. SUTCLIFFE. That is certainly one way.

Mr. VACCARELLO. And you can build in a deductible that would result in 50 percent of the claimants never getting paid anything from anybody.

Mr. SUTCLIFFE. Which is our present system. I mean that under our present system, 50 percent not getting paid anything.

Mr. VACCARELLO. The point I am getting at is there are a number of ways of reducing the cost, but do we achieve an equitable and a just balance between the needs of the people and the problems and efficiency in the system?

Mr. SUTCLIFFE. I think that is a concern that should always be focused upon.

Senator HART. I have only one final comment and if you wish to react to it—

Mr. BAYLOR. We always react to every comment. I assure you.

Senator HART. I was struck by your comment that there are two aspects of the insurance reparation system; one you characterized as

who, how and what amounts to compensation delivered; and two, the resources; and to separate the two between I imagine the State and the Federal level of government would be to try to unscramble the egg.

I am struck by the analogy of the present efforts of revenue sharing which exactly reverses the roles and has the Federal Government supplying the resources and the States to determine who, how and what amounts that money is paid. To the extent that we are philosophically endorsing the concept of revenue sharing, it is not inconsistent with the approach of separating the who, how, and what amounts from the resources in the insurance approach.

Mr. BAYLOR. I think what I am getting at there is to suggest if the Federal Government—now, I realize that in S. 945 you have not established an authority over promulgating the rates. But we can anticipate that as the system will develop under S. 945, and inevitably if you are going to set forth a program and what the policies are going to provide, the next thing is going to have to be a promulgation of that and the regulatory function of the States over a system that is being promulgated by the Federal Government is really relatively inconsistent, and eventually, I think we cannot have one setting one system and the other regulating it. I think that was my point.

Senator HART. Thank you very much.

Mr. BAYLOR. I do not know much about the revenue sharing. I wish I knew more.

Mr. VACCARELLO. Senator, if I might add, the director referred to innovation at a State level, and I would like to take this opportunity, since I know you are interested in the subject, to demonstrate that we in Illinois have been innovative.

One of those areas which demonstrates an innovation is the insolvency guarantee fund. We are in the process of enacting and have received every assurance that we will be shortly passing a law in Illinois, an insolvency deposit security act, which not only ties in the insolvency in the event of insolvency but, under our bill, all Illinois insurance companies will be required to make deposits up to \$12 million to guarantee payment of their claims, and hopefully that will not only give us a bill which will deal with insolvency, but will give us protection methods for the citizens of Illinois that will prevent the insolvencies—in addition to other pieces of legislation.

Senator HART. How many solvency guarantee funds are there?

Mr. BAYLOR. We do not know of any—insolvency guarantee funds; 25 or 26, something like that.

Mr. SUTCLIFFE. The last figure we were given was 38.

Senator HART. I am sure Senator Magnuson, the chairman, would want me to express his appreciation to the Governor for that letter and your testimony.

Mr. BAYLOR. Thank you very much, and we are very pleased with your interest in the program. Thank you, sir.

For the purpose of the record, sir, may we introduce the support which we have received from the Illinois Defense Counsel in this matter?

Senator HART. Yes.

(The material follows:)

ILLINOIS DEFENSE COUNSEL,
LAW, EQUITY, JUSTICE,
May, 14 1971.

At a recently called special meeting, the Illinois Defense Counsel Board of Directors has unequivocally endorsed the Illinois Plan for Automobile Reparations System Reform, recently proposed by the Illinois Department of Insurance and currently before the Illinois Senate Judiciary Subcommittee. The Director of Insurance and members of the subcommittee: Everett E. Laughlin, Philip J. Rock (Co-Chairmen), John G. Gilbert and Thomas C. Hynes, have been informed.

The membership of the Illinois Defense Counsel consists of 335 attorneys throughout the State of Illinois who devote the majority of their law practice to the defense of personal injury litigation. It is believed this is the first time an attorney's association has unequivocally endorsed any of the so-called "no-fault" insurance plans.

WILLIAM J. VOELKER, Jr.,
President.

MAY 14, 1971.

Re: Illinois plan for automobile reparations system reform.

DEAR ILLINOIS DEFENSE COUNSEL MEMBER:

On May 12, 1971 a special meeting of your Board of Directors convened to consider the following motion:

"That the Board of Directors of IDC take a position endorsing the Governor's proposal in total."

Because of the profound implications in such a motion, not only for our future practice, but also because the Plan deals fundamentally with some of the finest institutions in our society, I feel it is appropriate to advise you of my views after this vote was taken.

Let me assure you that the Board studied this matter long and hard. The debate was heated and anyone hearing the witnessing the depth of sincerity of purpose and profundity of expression would have been impressed, as I was. What was considered and ultimately done was not done to save our practices in any narrow sense, but rather done as a first and controlled step towards the goal of meaningful reform.

In what is undoubtedly an historical action, the Board voted to pass the motion in its entirety. Following its passage, it was agreed that Illinois Defense Counsel should make known its position on the Illinois Plan. To that end, appropriate telegrams were sent to the Illinois Senate and members of the press, is perhaps by this time has come to your attention.

In its consideration, the Board was acutely aware of the injustices resulting from calendar delays in major metropolitan areas which have proven extremely resistant to other attempted solutions. These injustices, as you know, have contributed substantially to public dissatisfaction with our present system, even in areas in which no calendar delay exists. Also, we were impressed by the profligate waste of time, money and talent for all concerned in litigating small property damage cases and personal injury cases involving only temporary injuries.

As you will have noted, the Illinois Plan makes no alteration in the right of a person to recover damages for pain and suffering in cases of death, dismemberment, permanent total or permanent partial disability, or permanent serious disfigurement. The only limitation on damages for pain and suffering is in cases of temporary injuries, limiting damages to 50% of the reasonable medical expenses up to \$500 and 100% of those same expenses in excess of \$500.

Further, the Plan provides for court supervised mandatory arbitration where the amount in controversy is \$3,000 or less. Provision is made for the right to a trial de novo after arbitration.

In addition, inter-company claims of bodily injury and property damage must be processed through inter-company arbitration.

Finally, the technique of the Plan is to provide for certain mandatory first-party coverages in automobile liability policies, with certain excess coverages required as options to the insured, thereby preserving maximum freedom of choice to the insured.

At the risk of duplicating information you have already received, I attach a machine copy of the outline and summary of the Illinois Plan as described by the Director of Insurance.

We believe these changes would be in the best interests of the citizens of Illinois. We hope you will agree their adoption will permit the adversary system to meet the challenges of the day by concentrating on substantial cases.

Our position is obviously not binding on individual members. Nonetheless, we commend it to you as the best judgment of our collective leadership. What we do today does not irrevocably bind us to the Illinois Plan tomorrow if its actual purpose does not meet our expectations. Indeed, one of the reasons for our endorsement of the Illinois Plan is that it supplements rather than supplants the traditional American system of jurisprudence. Additionally, it essentially preserves the virtue of personal responsibility to which you have so long been unequivocally committed.

With the solemnity of our responsibility to society and the single-minded conviction that the adversary system as preserved is worthwhile, we endorse the Illinois Plan with its first-party coverage provisions and system reforms. I hope you will receive this news in the same spirit in which it is conveyed: that society's lasting reforms have been because of attorneys, not despite them.

Very truly yours,

WILLIAM J. VOELKER, Jr.,
President.

THE ILLINOIS PLAN

Following is a brief outline of the major proposals recommended:

1. MANDATORY MINIMUM MEDICAL, HOSPITAL, FUNERAL, INCOME CONTINUATION, AND LOSS OF SERVICES BENEFITS

Every private passenger auto liability policy issued or delivered in Illinois must provide the following minimum 1st party benefits:

- A. Medical, hospital and funeral benefits: \$2,000 per person.
- B. Income continuation benefits: 85% of lost income subject to a benefit limit of \$150 per week for 52 weeks.
- C. Loss of services benefits: Reimbursement for expenses incurred to replace services ordinarily performed by an unemployed injured insured subject to a benefit limit of \$12 per day, for 365 days.

Applicable Notes

- (1) Benefits should extend to pedestrians.
- (2) Payments are deductible from Uninsured Motorists' Coverage.
- (3) Workmen's Compensation exclusions allowed.
- (4) No deductibles (1st day coverage).
- (5) The benefits should be primary and paid in addition to any other collateral benefits.

2. EXCESS LOSS COVERAGES

Every private passenger auto liability policy issued or delivered in Illinois must make available to the insured and members of his household—on an optional basis—coverage which will provide the following minimum benefits upon depletion of the mandatory coverages:

- A. Additional medical and hospital benefits.
- B. 85% of lost income subject to a benefit limit of \$150 a week for 260 weeks.
- C. Reimbursement for expenses incurred to replace services ordinarily performed by an unemployed injured insured, subject to a benefit limit of \$12 per day, for 260 weeks.
- D. Dependent survivors benefits of 85% of wages subject to a benefit limit of \$150 per week for 260 weeks.

Applicable notes

- (1) Right of rejection permitted.
- (2) May be purchased in lieu of Uninsured Motorists' Coverage or benefits deductible from Uninsured Motorists' Coverage.
- (3) Workmen's Compensation exclusions allowed.
- (4) Minimum aggregate limits of 50/100 for all benefits.
- (5) Benefits should be primary and paid in addition to any other collateral benefits.

3. LIMITED EXCLUSION PERMITTED

First party mandatory and optional excess coverages may exclude the payment of benefits where such payment would be in violation of public policy (to drivers of stolen vehicles, et cetera).

4. PROMPT PAYMENTS OF BENEFITS

A. Payments to all insureds should be made promptly upon receipt of proof of loss.

B. Where losses can be reasonably presumed to extend beyond a 30 day period, partial payments should be made no less often than every 30 days.

5. OFFSET

Benefits available to the insured from his insurer are deducted from any verdict or award obtained by the insured against a wrongdoer.

6. SUBROGATION AND INTER-COMPANY ARBITRATION BY THE INSURER

A. Companies are subrogated to the extent of any 1st party payments made.

B. As a condition of doing business in Illinois, property and liability companies must be members of intercompany arbitration.

C. Inter-company claims (B.I., P.D., et cetera) must be processed through binding inter-company arbitration.

7. UNINSURED MOTORISTS

A. All payments made under any 1st party coverage are deductible from the insurers Uninsured Motorist Coverage liabilities.

8. ADVANCE PAYMENTS

A. prompt payments of property damage losses in cases also involving personal injury and partial advance personal injury payments should be encouraged.

B. Evidence of advance payments should not be admissible and payments should be credited against any settlement or verdict.

9. GENERAL DAMAGES

Except in serious cases such as those which involve death, dismemberment, disfigurement, permanent total disability or permanent partial disability, damages for pain and suffering should be limited to 50% of the first \$500 of medical expenses and 100% of the excess over \$500.

10. ARBITRATION—\$3,000

Court supervised mandatory arbitration should be provided in all auto injury or property damage cases where the amount in controversy is \$3,000 or less, with rights to a trial de novo. Arbitration of matters not in litigation should be permitted.

11. FRAUD

Monetary penalties, imprisonment and the mandatory temporary suspension of all licenses involved in the acts of the participants (medical and legal licenses, et cetera) should be enacted as penalties for participation in fraudulent claims.

12. MEDICAL DISCOVERY

All claimants and insureds should be required to furnish medical information and submit to physical examinations.

SUMMARY

Implementation of the recommendations proposed are designed to result typically in this situation for the Illinois citizen:

(1) The injured insured victim of an auto accident will be able to *obtain prompt payment* (every 30 days) for the majority of his medical expenses, lost wages and miscellaneous expenses without having to sue or make a claim against another company, but he will still have the right to use or make a claim against the wrongdoer for those expenses or general damages for which he does not have benefits available under his auto policy.

(2) In the event he must sue to recover, he should be able to receive a *prompt trial* because:

- a. Nuisance claims will have been eliminated from the trial calendar; and,
- b. Inter-company disputes will have been removed from the trial calendar.

If the amount in controversy is less than \$3,000, he will have the right to prompt arbitration of the dispute. But, if the amount exceeds that, he will receive a speedy trial because of the removal of many cases from the courts by this plan.

In effect, his own insurance company pays most of his losses on behalf of the alleged wrongdoer's company and then, without clogging up the courts, the company attempts to collect from the alleged wrongdoer's company the amounts advanced.

Senator HART. Our next witness is a man who served with distinction in the Federal Government and who now is the president of the American Insurance Association, Mr. T. Lawrence Jones. I see that he is accompanied by the association's general counsel, Robert N. Gilmore, and a very observing Washington representative and vice president of the association, Mr. Melvin L. Stark.

STATEMENT OF T. LAWRENCE JONES, PRESIDENT, AMERICAN INSURANCE ASSOCIATION; ACCOMPANIED BY MELVIN L. STARK, VICE PRESIDENT, GOVERNMENT AFFAIRS, AND ROBERT N. GILMORE, JR., GENERAL COUNSEL

Mr. JONES. Thank you very much, Senator Hart, and it is a pleasure to be before you again. We appreciate this opportunity. We are very interested in this subject. We have been very impressed by the interest and work and devotion this committee has given to a complicated subject.

My name is T. Lawrence Jones and I am president of the American Insurance Association, an organization of insurance companies writing all kinds of property and casualty insurance, including approximately 30 percent of the Nation's automobile insurance business. With your permission, I would like to address myself first to S. 945 and conclude with some comments on S. 946 and S. 976.

The American Insurance Association has for several years been a strong proponent for major auto accident reparations reform. We are, therefore, most pleased to have this opportunity to appear before this committee and present our views on S. 945 introduced by Senators Hart and Magnuson, Muskie, Proxmire, and Ribicoff.

There is no need to state the case for comprehensive reform. Profs. Keeton and O'Connell were among the first in recent years to expose the tragic failures of the present state of affairs. They were the first to present a detailed plan for change. American Insurance Association's special committee on automobile accident reparations completed a yearlong study in October of 1968, and at that time made public a report calling for a complete no-fault auto accident reparations system. Last year the New York Insurance Department report "Automobile Insurance . . . For Whose Benefit?" impressively documented the case for reform and presented what we believe is an irrefutable case for total change.

Finally, we have had the DOT studies and its recommendation. Again the case for major reform is convincing and compelling.

In our judgment the great debate has ended. It can no longer be seriously contended that the auto tort liability system must be maintained. As we see it, the area of discussion has narrowed.

Senator HART. Mr. Jones, if I were down there testifying I ~~say~~ say that, too, but if you were up here listening for the last ~~week~~ or two you would not agree that the debate has ended.

Mr. JONES. This has been one of the great disappointments we have had since March 18, 1971, when Secretary Volpe came and appeared before you. We think the debate should be ended. It is obvious that it is not. We sincerely support a State-by-State approach, and we did this, we began on this route because we thought that we could enact no-fault automobile insurance plans sooner State-by-State than we could by coming to Congress and getting the attention of Congress.

It appears now to us that many of the people who are coming and telling you that they also support the State-by-State method do so just to have 50 more debates to oppose. So it is just in our view—and we must admit that it is just in our view—that the debate should be ended, but it obviously is not.

There are two issues before us. One, should we seek change through State or Federal action? Two, how extensive should the change be to meet the pressing needs of the public?

I would like to address myself to these two questions.

STATE VERSUS FEDERAL

Obviously S. 945 and similar bills are based on the premise that Federal action is necessary and desirable. When American Insurance Association's study was completed in October 1968, our special committee in its report stated:

The committee in its deliberations has assumed that a revision of the present system would be achieved at the State level. This would give an opportunity to test and observe a no-fault system in actual operation. The committee notes, however, that Federal action to achieve uniformity and countrywide application is a possibility.

At that time American Insurance Association had not developed a policy position on the question of whether there should be a State or Federal solution, although all our deliberations were on the assumption that reform could and would be achieved at the State level.

In recent months we have considered specifically the roles of the State and Federal Governments. American Insurance Association believes the States should be afforded an opportunity to enact real no-fault auto accident reparation laws. We have no specific time limitations. In our opinion the sooner the better. It would be extremely beneficial to have the experience of working with a substantial no-fault law at the State level before establishing a national pattern. This is one of the advantages of our Federal system and it would not be wise to discard this opportunity for laboratory experimentation which is available through the States. The knowledge and expertise gained under a State law will be invaluable in formulating a smoothly working system.

Although one could argue that the threat of Federal legislation might spur the States to action, it could have just the opposite result. If major proponents for change were to shift their support to a Federal statute, State legislatures might conclude that the pressure for change was no longer on them to provide at the State level much needed reform. It would be an easy out and would be a way for them to avoid what so many legislators believe is a necessary but uncomfortable task.

Senator, I would like to relate a specific experience if I could. One of the witnesses earlier today made a very fine statement, Mr. Haring

of New Jersey, who mentioned that they had a commission appointed by the Governor to study this matter. I had the opportunity to appear before that commission in executive session. All members were not there. But I do want to say that the chairman of the commission is a very objective and courteous man, but the inclination on the part of some of the commission members was, do we really have to deal with it? Isn't Congress going to take care of this eventually? And we contended that it was a responsibility that they should face up to and that the citizens of New Jersey could get a plan that would be of benefit to them, providing a better product at a lower price, if they would respond to this challenge.

So it can work against us—your legislation can work against State action. Some contend that it can work as a spur for State action, but it seems to work both ways.

Of course, there are drawbacks to the State approach. First, there is the possibility that the States will not act. The State legislative record of the past 3 years is not impressive. It is set forth in the attached exhibit. Only Massachusetts has enacted reform legislation and its law is a modest first step. On the other hand, there is no assurance that auto accident reparations legislation will pass the Congress and be approved by the President. I say this despite the fact that there appears to be much more support for no-fault auto reform in the Congress than we anticipated several months ago. Still, reform will be vigorously opposed at every turn by the same forces which have thwarted auto no-fault bills in the State legislatures. And they will have the additional argument that the Federal Government is invading an area of accident reparations heretofore not dealt with by the Federal Government.

The other possible drawback to a State-by-State approach is the chance that we may end up with a pattern of legislation which will differ markedly from State to State. This would be unfortunate. It would be inefficient and expensive to administer no-fault programs if they varied substantially. However, it should not be assumed that we will have a hopelessly diversified pattern of State laws. This did not occur when State financial responsibility laws were enacted. These laws, while differing in some important details, are compatible and in fact they are conspicuous for their high degree of uniformity. Even the three States with compulsory laws, Massachusetts, New York, and North Carolina, are well coordinated with the financial responsibility laws of the other States.

In the final analysis, the Congress can act if the States either fail to act at all or produce an unworkable statutory patchwork. We do not rule out ultimate Federal action depending on how well the States respond to the public need for a satisfactory auto accident reparations system throughout the country. If the States falter, I can readily visualize our strong support for Federal legislation.

In short, we urge the States be given the opportunity to enact sensible reform legislation. If they do not meet the challenge, then it will be time for the Congress to act.

EXTENT OF REFORM

American Insurance Association developed and supported a complete program for automobile accident reparations reform. Our bill

replaces the present auto tort liability system in toto. In that respect it is similar to the reform measure proposed by the New York Insurance Department and endorsed by Governor Rockefeller. Sometimes we have been accused of intransigency because we continue to believe our proposal does achieve maximum reform but it has withstood sniping from the status quo stalwarts who have persistently but unsuccessfully sought to demolish it.

Our espousal of complete reform does not mean that we cannot accept and endorse proposals which fall short of our model. We believe that S. 945 and similar bills in the Congress offer substantial and desirable reform. American Insurance Association can support at the State level legislation which closely follows S. 945. Our support of this kind of State legislation would be subject to certain amendments which we believe are necessary. We will briefly discuss those amendments.

AUTO INSURANCE BENEFITS PRIMARY

Under S. 945 net economic loss benefits are reduced by the amount of any benefit from other sources unless such other insurance or other source of benefits contains explicit provisions making its benefits supplemental to those paid under a qualified no-fault policy. This means that the auto insurance benefits under the bill are secondary to other benefits. We think this is unsound. We believe auto insurance benefits should be primary in order to achieve efficient administration of the insurance system.

If such benefits are primary, they will be paid promptly by the auto insurer upon the determination that there has been an auto accident. This is simple and easy. It will avoid costly and time-consuming administrative work in ascertaining what other benefits may be available to the injured person. Making auto insurance primary will also greatly simplify the process of classifying motorists for rating purposes.

Sir, I would like to point out we have never based our contention for a change in the auto insurance system in any way on the congestion of the courts. That is not the thing that really bothers us. When we get a claim under the fault system or the tort liability system there is a minimum amount of investigation we have to do to see that there is liability on the part of our policyholder, and we are involved with a third-party claimant that we do not know anything about. Unless it is a very small amount of money it takes almost 2 months to process an ordinary claim. And it is the 2 to 3 to 6 months involved in investigating a claim and paying that we get the real complaint about, not when it goes to the lawyer and the court.

We get complaints there, but it is mainly the ordinary ones. If automobile insurance is primary, then all we will have to determine is that there was an automobile accident, then we know we have to pay. If auto insurance is secondary, we can tell you ahead of time, the administrative work we have in the first instance will be increased, we will have to ask, "What other insurance coverages do you have?" And after the accident we will have to ask, "Are they still in effect?" before we even know there is liability. On the other hand, if we were cooperating with the national health program or any other insurance benefit program, it is equally easy to administer from their point of view.

Let's say there is a national health insurance program and all they have to determine is that the man is in the hospital or has gone to the

doctor because he was involved in an automobile accident and they know that that is an exclusion from their coverage or maybe they might have copies. By the same token, we can act promptly if all we have to determine is that the injury really arose from an automobile accident. We really think that this is the soundest system all the way around.

Further, if other sources of benefits are primary, for example, deducted from auto insurance benefits, it has the effect of transferring the costs of automobile accidents to nonmotorists. In our judgment it is wrong to spread the cost of automobile accidents over other forms of insurance. Those who generate costs should bear the costs. The way to assure that this will be achieved is to make auto insurance benefits primary and not disperse the cost of auto accidents through other insurance and benefit systems. I am sure the Senator has heard the economists describe this as internalization of costs.

We, of course, do not favor duplication of benefits. Other systems can readily adapt to an auto reparations system which is primary.

PROPERTY DAMAGE

S. 945 does not include property damage. Thus it retains the tort system in an important area of auto accident claims. This means that almost every auto accident will have to be investigated, an expensive process, to determine liability. Obviously important potential savings will be lost.

In our opinion the auto insurance system should not be saddled with the burden of retaining property damage tort claims.

REJECTION AND NONRENEWAL

S. 945 places severe prohibitions on insurers with respect to rejecting an applicant for insurance and the right not to renew a policy. No insurer would be permitted to reject any applicant for insurance. The only exception is where the domiciliary State insurance supervisory authority finds that its solvency would be impaired by writing additional policies. This exception is not available in the case of policy renewals.

These provisions might be acceptable if incompetent and reckless drivers were removed from the road, but in real life this does not happen. In our judgment these provisions are far too severe and should be eliminated. Under a no-fault auto insurance system companies should be able to underwrite all risks much more knowledgeably than is the case today because they will be able to measure the loss potential of each driver.

The industry recognizes its obligation to provide completely adequate coverage to all licensed motorists who cannot be readily insured in a voluntary market. The rejection and nonrenewal provisions of S. 945 are not the way to assure that each licensed motorist will be afforded adequate insurance coverage.

Senator, I would like to add that certainly the member companies of our association do recognize this as a responsibility. We know that you are directing your attention toward a real problem and we know that the industry has the responsibility of providing what we all should think of as a full market or coverage for those people that need it.

whether we would choose to have them as our policyholders or not. We have a special committee working on this problem. It is made up of very senior executives. We have hired some consultants and specialists, and the man that is heading up this team of consultants is a distinguished citizen of your State, a former insurance commissioner there, David Dykehouse, who practices law in Detroit.

Senator HART. An extremely able man.

Mr. JONES. A very able man and very enjoyable to work with. He has pulled together a vast amount of material which our committee will have to sort through in the next few months. But it is all directed toward this problem of how we as an industry and as companies can provide the full market that the public needs.

POLICY FORMS, RATING CLASSIFICATIONS AND TERRITORIES, STATISTICAL PLANS

S. 945 bestows on the Secretary of Transportation enormous powers with respect to policy forms, classes of risks and rating territories. It also gives the Secretary extensive control over the kinds of statistics companies can compile and requires detailed reports to be made to the Secretary.

Clearly these provisions would be inappropriate if the bill were to be used as a model for State legislation. However, looking at the bill strictly as a Federal no-fault auto reform measure, we believe these provisions should be eliminated. As we view these provisions, insurance companies would be subject to both Federal and State regulation of policy forms, rating classifications and territories and of the premium rates charged to policyholders.

From our standpoint, this confusing overlapping of regulatory authority is unsound. It should also be noted that regulatory provisions of this nature in a Federal no-fault bill will play into the hands of the defenders of the status quo. They will be able to point out that these provisions raise again the specter of Federal regulation of the insurance business. Auto insurance reform is too important to be burdened with any nonessential issues.

S. 946 is the proposed Motor Vehicle Group Insurance Act. This bill is designed to outlaw State legislative or regulatory restrictions on mass marketing. American Insurance Association is unqualifiedly opposed to any kind of restriction on methods of marketing insurance policies.

There have been two major studies—"Collective Merchandising of Automobile Insurance" by Prof. Bernard T. Webb, published in 1969; and "Mass Marketing of Property and Liability Insurance," undertaken by Dean Spencer Kimball of the Wisconsin Law School and Prof. Herbert Denenberg of the University of Pennsylvania Wharton School as part of the DOT research. These studies strongly support removal of all restrictions on mass merchandising.

In fact, we do not believe there is a single student of the property and casualty insurance business who does not favor the encouragement and widespread utilization of various mass marketing procedures. They all deplore obstacles to mass marketing developed at the State level either through legislative enactment or insurance department regulation.

The Kimball-Denenberg study concluded:

The State of the law in any given jurisdiction can only be ascertained by an exhaustive look at the statutes, insurance regulations and case law of the jurisdiction. It is clear, nonetheless, from all the information we have at hand, that there are a multitude of unreasonable barriers to the free development of mass marketing of property and liability insurance which are found in the laws of the several States. Undoubtedly those barriers will gradually be lowered, or even eventually eliminated, as the normal processes of evolution in the marketplace produce changes like those that have taken place in group life and health. But the development is bound to be slow and uneven. There is an urgent need to strike down unreasonable barriers in the path of mass marketing so that it may help provide a more adequate and equitable insurance market.

In agreeing with the view that there is an urgent need to strike down these unreasonable barriers, we would merely add that this restrictive legislation is still being introduced in State legislatures with strong backing. Last year the New York Legislature passed a bill which if enforced would have precluded many mass merchandising plans. It had been vigorously opposed by the New York Insurance Department and by other Government bodies, as well as by employer, union and professional groups and was ultimately vetoed by Governor Rockefeller. However, a somewhat similar restrictive bill became law in Louisiana in 1970. Right now a legislative effort is being made in Connecticut to overcome a court decision which held that a 1969 law did not prohibit a form of mass merchandising.

May I add that in the last few days we have learned that an insurance code that had just been passed in Nevada and has not yet been signed by the Governor there as originally proposed followed the model in Wisconsin and Minnesota that permitted the normal development of mass marketing methods, but during the course of the legislative consideration the agents in Nevada succeeded in getting a chapter amendment to put in a series of restrictive provisions on which we do not yet have a full report.

We cannot tell you exactly how it is, but that just occurred.

Accordingly, we think the kind of legislation contemplated by S. 946 is desirable and necessary. We would prefer to see it encompass all property and casualty lines and not be limited to motor vehicle insurance. But of even greater importance, the law should be so drafted that it will be clear that it applies to all forms of mass marketing. I think we can all agree that the ultimate goal of collective merchandising is what might be called true group insurance such as now is so common in life and hospitalization insurance.

In the words of the Kimball-Denenberg study, page 7, true group—is a plan for the insuring of individual risks, under a single program of insurance, under which the insurance company will consider all such risks to be insurable without regard to individual underwriting characteristics and will set a rate, determined in whole or in part by the characteristics and experiences of the group and uniform for all members of the group or broadly averaged over the group.

However, there are very few pure or true group plans covering automobile or other personal lines of insurance in operation today. Generally employer or union payments are a feature of true group plans. Most authorities believe that true group for personal lines of insurance is not in the immediate offing.

In the meantime, other forms of mass merchandising which retain reasonable individual underwriting standards but which provide such benefits as lower costs and convenient budgeting through pay-

roll deductions should be not denied the consumer, especially the car owner. In fact, the costly nature of the present auto tort liability system suggests that these plans are even more important right now than they would if we were operating under a lower cost first party no-fault program.

It will be argued, I am sure, that legislation such as S. 946 is a form of Federal regulation at the expense of State regulation. We do not believe it constitutes Federal regulation any more than does the McCarran Act. For example, the McCarran Act puts it quite bluntly that acts of boycott, coercion, and intimidation are illegal and to the extent that such acts might exist they are subject to the Federal antitrust laws.

All that S. 946 would do, especially if broadened and clarified, would be to lay down an understandable rule in the area of marketing. If such a Federal law were to be passed, present restrictive laws and regulations would be repealed by the States or would die on the vine as no longer valid. In our judgment, no Federal action would be necessary. By this I mean that we do not visualize any need for enforcement by Federal authorities. In fact we doubt that a provision authorizing the Attorney General to institute injunctive proceedings is necessary. The Congress having spoken, that should be sufficient.

American Insurance Association endorses legislation along the lines of S. 946.

S. 976

The third bill before the committee is S. 976. This is the proposed Motor Vehicle Information and Cost Savings Act. Its purpose is "to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage."

American Insurance Association supports all constructive efforts to encourage the design and production of safe motor vehicles. Ideally, cars should be as safe as possible in terms of what happens to the occupants after the crash. In recent years the main concentration, and properly so, has been on striving to develop cars which will protect car occupants in the so-called second collision.

Now the public is recognizing the necessity of designing and manufacturing cars which can sustain damage without costly repairs. Car damage, as we know, is an important factor in the high cost of insurance.

Senator, if I may at this point, I would like to respond to the position taken before this committee on these bills by representatives of the automobile manufacturers, that safety features in automobiles have no effect on insurance rates. This simply is not true.

And the evidence to the contrary is irrefutable. The safety features built into American autos over the last 5 years, safety belts, collapsible steering wheels, ballooning windshields and the like, have all been related to passenger safety. The successes of these measures are reflected in the lower cost of insurance covering bodily injury.

The rapid upward spiral of bodily injury liability insurance rates has been halted. In State after State we have seen either decreases in these rates or only slight upward revisions as might be caused by the overall inflationary trend.

I believe we sent a copy to you, Senator Hart, of a study made by our consultants as to what caused automobile insurance rates to go up, and it reported that all of the costs involved in automobile insurance policies are related to service industries, and service industries do not have a productivity increase to offset increases in costs as they come about, or the inflationary cost as it occurs.

I would like to say that these inflationary increases are greatest in the area of personal injuries—bodily injuries—particularly the hospital in recent years and the doctor bills, and in spite of these great inflationary increases and no productivity increase offsetting those increases, we have seen in some cases an actual decrease in bodily injury premiums, and we know it is attributable to those safety standards; and in some cases there have been much smaller increases than you might expect.

The difficulties we have had in the last 3 years in greatly increased automobile insurance rates have all been associated with property damage. Prior to that, it was all associated with the bodily injury.

Senator HART. Thank you for that comment which you have added, I note, to the prepared testimony.

Is it fair to assume from the study that we welcome receiving, that just as there has been a stabilization and perhaps a reduction in the cost of insurance for bodily injury following the imposition of safety standards, a similar stabilization or reduction could be anticipated if we manage to move to the standards of property loss reduction?

Mr. JONES. We are very confident of it. I would like to continue, that unquestionably when automobiles are built to withstand collision damage to the extent that they now provide better protection to passengers, there will be similar effects on property damage insurance rate levels. The simple fact is that insurance rates can be traced to two factors, the number of claims and the cost of those claims.

Elementary mathematics thus make it clear that a reduction in the claims will mean a reduction in insurance rates. Even if we restrict ourselves to the possibility of making cars easier to repair, we must conclude that such a step would have a favorable effect on insurance costs.

The insurance industry, with the help of the Insurance Institute for Highway Safety, is conducting a pilot study seeking to develop data on the cost of repairing cars of different make and model. We are endeavoring to do this by analysis of current cost information in the hands of insurance companies as cars of claimants and policyholders are repaired. In addition, the Insurance Institute for Highway Safety has conducted rather extensive low-speed car crash projects, the results of which have been brought to the attention of this committee. This IIHS testing program has dramatically demonstrated the need for improved car design.

Over the years the insurance industry has provided leadership in driver education, motor vehicle law enforcement, and traffic engineering. We still believe these areas of traffic safety are important, but now our work is emphasizing reduction of loss resulting from car accidents. This means we want to do all we can to make sure our occupants are not seriously injured. It also means that we want to have cars which can withstand many of the commonplace crashes without huge repair costs.

S. 976 directs the Secretary of Transportation to establish by July 1, 1972, a system of testing to determine and compare the susceptibility to damage of motor vehicles under normal operating conditions. If feasible, tests would be developed to determine and compare the risk of personal injury or death to car occupants resulting from traffic accidents which might occur at normal speeds and under normal operating conditions.

As soon as possible after July 1, 1972, the Secretary would promulgate property loss reduction standards which will minimize car damage, such standards, of course, to be compatible with safety standards aimed at protecting passengers.

S. 976 requires manufacturers to test production models of every make and model of passenger car in accordance with the regulations promulgated by the Secretary. The results of this testing are to be furnished to the Secretary and prospective buyers.

The bill also directs the Secretary to make this testing data available to insurance companies "for use in determining premium rates for insurance covering property damages and personal injury related to the factors tested under the provisions of section 126 of this act." The Secretary is also required to report to the President and the Congress on the extent to which the motor vehicle insurance industry is utilizing such information in the determination of insurance premium rates.

We would urge that there is a need for a great deal of flexibility in incorporating new techniques for rating car damage by make and model. We do not believe the Insurance Commission should be forced into any specific rating methodology or procedure based upon motor-crashing data and engineering analysis. The kind of information can be very helpful in rate-making but it must be evaluated with care and not be applied mechanically.

In supporting small business, we need to be realistic about the motorist's car. Better able to withstand rougher terrain, a car which can be repaired more easily on the road, and which does not need to recognize the traffic laws of every country are the way. But we would stress that the motorist must be made aware of his role as our contact to the foreign world. He must be made aware of the public's safety as well as the safety of the foreign world to damage."

I would also add a comment regarding our common interest in having considered the other parties involved in the case. I have commented on them specifically in my report.

Where do we stand on the question of compensating people for the loss of their jobs?

The rate of response for return letters was 100 percent. The only balance sheet item left unattended was the company's contribution to the list would be the effect of their expense of the new and for doing support major returns. For the 1960 and 1961 years, the company had included the insurance notes. For the 1962 and 1963 years, the company had reported the insurance notes. The last important expense of the company's industry are advertising and other expenses. The company's total cost of vocal support of advertising has been

I believe we sent a copy to you, Senator Hart, of a study made by our consultants as to what caused automobile insurance rates to go up, and it reported that all of the costs involved in automobile insurance policies are related to service industries, and service industries do not have a productivity increase to offset increases in costs as they come about, or the inflationary cost as it occurs.

I would like to say that these inflationary increases are greatest in the area of personal injuries—bodily injuries—particularly the hospital in recent years and the doctor bills, and in spite of these great inflationary increases and no productivity increase offsetting those increases, we have seen in some cases an actual decrease in bodily injury premiums, and we know it is attributable to those safety standards; and in some cases there have been much smaller increases than you might expect.

The difficulties we have had in the last 3 years in greatly increased automobile insurance rates have all been associated with property damage. Prior to that, it was all associated with the bodily injury.

Senator HART. Thank you for that comment which you have added, I note, to the prepared testimony.

Is it fair to assume from the study that we welcome receiving, that just as there has been a stabilization and perhaps a reduction in the cost of insurance for bodily injury following the imposition of safety standards, a similar stabilization or reduction could be anticipated if we manage to move to the standards of property loss reduction?

Mr. JONES. We are very confident of it. I would like to continue, that unquestionably when automobiles are built to withstand collision damage to the extent that they now provide better protection to passengers, there will be similar effects on property damage insurance rate levels. The simple fact is that insurance rates can be traced to two factors, the number of claims and the cost of those claims.

Over the years the insurance industry has provided leadership in driver education, motor vehicle law enforcement, and traffic engineering. We still believe these areas of traffic safety are important, but now our work is emphasizing reduction of loss resulting from car accidents. This means we want to do all we can to make sure car occupants are not seriously injured. It also means that we want to have cars which can withstand many of the commonplace crashes without huge repair costs.

S. 976 directs the Secretary of Transportation to establish by July 1, 1972, a system of testing to determine and compare the susceptibility to damage of motor vehicles under normal operating conditions. If feasible, tests would be developed to determine and compare the risk of personal injury or death to car occupants resulting from traffic accidents which might occur at normal speeds and under normal operating conditions.

As soon as possible after July 1, 1972, the Secretary would promulgate property loss reduction standards which will minimize car damage, such standards, of course, to be compatible with safety standards aimed at protecting passengers.

S. 976 requires manufacturers to test production models of every make and model of passenger car in accordance with the regulations promulgated by the Secretary. The results of this testing are to be furnished to the Secretary and prospective buyers.

The bill also directs the Secretary to make this testing data available to insurance companies "for use in determining premium rates for insurance covering property damages and personal injury related to the factors tested under the provisions of section 126 of this act." The Secretary is also required to report to the President and the Congress on the extent to which the motor vehicle insurance industry is utilizing such information in the determination of insurance premium rates.

We would urge that there is a need for a good deal of flexibility in incorporating new techniques for rating car damage by make and model. We do not believe the insurance companies should be locked into any specific rating methodology or procedure based upon car-crashing data and engineering analysis. This kind of information can be very helpful in ratemaking but it must be evaluated and should not be applied mechanically.

In supporting sound legislation designed to achieve safer cars for motorists, cars better able to withstand low-speed crashes, and cars which can be repaired more economically, we are well aware of the need to recognize the practical problems confronting manufacturers. But we would stress that the auto manufacturers' concern, as well as our concern as auto insurers, is secondary to the overriding interest of the public in safer cars, as the bill puts it, "having greater resistance to damage."

I would also add a comment, Senator, that in endorsing S. 976 we have considered the other features involved in the bill. We have not commented on them specifically, but we endorse the bill as a whole.

CONCLUSION

Where do we stand in the struggle to achieve a new system for compensating people injured in auto accidents?

The rate of progress for reform is always slow. If we examine the balance sheet, there have admittedly been disappointments. High on the list would be the silence of many leaders of the bar who privately support major reform. Over the years some outstanding lawyers have chided the insurance industry for not espousing a better auto accident reparations system. Now that important segments of the insurance industry are advocating such reform, it would help a lot to have the vocal support of leaders of the bar.

Another disappointment has been the judiciary. We have in mind their apparent unwillingness to see any connection between the horrible delays in our criminal courts and the amount of court and judge time expended in the processing of personal injury auto accident suits. This is an unbelievable example of burying one's head in the sand.

There have, of course, been a few shining exceptions. I would like to stop and observe, if I could, sir, that Mr. Eugene M. Haring, who was here this morning, and one of his partners, Mr. Woodruff English, and Chief Justice Weintraub were three of the people that we had in mind when we drafted this part of the remarks, and it is very encouraging to see them take the role they have.

These lawyers and judges are to be commended for their intellectual integrity and willingness to speak their minds. These are qualities which one would normally associate with the legal profession.

If I may just add another story, Senator Hart, recently where I was appearing on a program speaking on no-fault, Judge Alfred P. Murrah, who is the senior Federal judge in the United States and the director of the Federal Judicial Center, told me a story that was very interesting.

He said that in 1946 Chief Justice Arthur Vanderbilt of New Jersey, accompanied by Judge Murrah, Judge David Peck of New York, and Judge Bodin of New York, asked to come and see our companies, our associations, and Judge Murrah said that our officials, our general counsel, then Mr. Ray Berry, who Mr. Gilmore was associated with, were very courteous to him, very nice, treated them fine when they were in New York, but these four judges came in and they said we would like to discuss with your association whether we could find some way to take the automobile accident cases out of the courts, and he said at that time the answers were all negative from our side, and he said he was glad to see that we stuck with the problem a little bit longer.

On the brighter side, we are heartened by the ever-growing support for no-fault auto insurance. The newspapers and all other news media have been overwhelmingly favorable. In increasing numbers legislators, even those who are lawyers, now admit that some kind of change is near at hand.

We would note here again the agents group that appeared before you, represented by Mr. Charles Rue, this morning, they have made forthright statements since 1968 when they came out with their plan shortly after ours. They gave me the honor of addressing them in 1969, and I want to say that that was the only totally favorable audience that I have ever had the opportunity of appearing before, Senator Hart, and discussing this subject.

They represented a very fine attitude all the way along. We have also been very encouraged in the last few weeks by the endorsement of the National Association of Casualty and Surety Agents, an outstanding group of outstanding agents, and they have endorsed principles along the lines of your legislation and ours, and they specifically endorsed our legislation. This is a very encouraging step.

The outlook for change has been greatly helped by the DOT studies. The interest of this committee and the House Interstate and Foreign Commerce Committee has been a major contribution to the growing support for reform. We would expect that the interest of these two

ongressional committees will continue and will result in careful valuation of the response of the States.

As mentioned earlier in our statement, we believe the States should have an opportunity to enact effective auto accident reparations legislation. But we repeat, this does not mean that we believe there is no role for the Congress. In fact, it is abundantly clear that the Congress must act should the States prove incapable of providing the kind of no-fault auto accident reparations laws which meet the criteria of genuine reform and substantial uniformity.

Thank you for your attention, Senator.

Senator HART. Mr. Jones, thank you for the statement you have just made. Clearly, as the history of this subject is made, the responsible attitude that you and the American Insurance Association have displayed will be acknowledged. Let me acknowledge it now.

Mr. JONES. Thank you, sir.

Senator HART. I know that it is not an easy leadership undertaking given the competing claims that necessarily are involved among the members of the association.

I would just like you to comment on a couple of things I guess. I am thinking of Judge Murrah's remark to you and wondering whether you are suggesting that we in the Congress apply the same sort of timetable to the development of plans—genuine reform plans—at the State level that his experience with the 1946 to 1971 timespan. That would be a 25-year period.

Mr. JONES. I think everything moves faster now, Senator, and I doubt if we would have that kind of infinite patience anymore. I would like to add this bit of history if I could.

In 1959 Gov. Pat Brown of California appointed a special study of automobile insurance, and Prof. Stanley A. Weigel, who is now a Federal judge, wrote the report known as the Weigel report, and at that time the member companies of our association—the name of the association then was the Association of Casualty & Surety Cos.—changed their position to the fact that they would no longer oppose any no-fault proposal. They did not change to an affirmative.

The reason they didn't change to an affirmative is they didn't see the reasonable possibility of early action. As a matter of fact, I remember Mr. Gilmore testifying before the Joint Insurance Committee in Massachusetts in the spring of 1967 to just that effect, that we neither opposed or supported the Keeton-O'Connell program that was before them.

That was not a very happy position, but in the spring of 1967, the Massachusetts House of Representatives passed the Keeton-O'Connell bill—one house did—and this was an indication to our companies that it was now feasible to take affirmative action, that there was support for it, that we could expect some action.

So we studied the problem to see what the best solution would be and we came in in October of 1968 with our program, and it seemed essential to wait until the study that the Congress had requested be done by the Department of Transportation had come in, and as you know that came in March 18, 1971, here before you in this committee.

I would have to say that we have been somewhat disappointed in the response that has occurred to Secretary Volpe's statement. It seemed to us that he was very clear about the fact that the debate

should be ended, that we should go to no-fault and we should do it right now.

I think I speak for our companies when I say that we have been disappointed in the State response so far.

Senator HART. I didn't mean to suggest seriously that I thought Judge Murrah's 25 years was what you were recommending, but is there any kind of early warning system that we could fix and watch for so that Federal action is not delayed needlessly or endlessly.

Mr. JONES. Senator Hart, I believe that the response of two States in the next few months is going to be terribly important to our member companies, and those are Florida and Pennsylvania. We began this year with really pretty high hopes of getting a number of plans enacted this year. At the top of our list were Hawaii, Alaska, Minnesota, New York, Connecticut, Florida, and later in the year came Oregon and Pennsylvania.

But we have suffered disappointments in those first five out of the original six; we only have Florida. We now have suffered a setback in Oregon and we only have Pennsylvania. I think if we can't accomplish significant and sensible reform in Florida and Pennsylvania during the rest of this year—the Florida legislative session is supposed to end June 6 but will probably go to the end of June—that our companies would be inclined to reappraise their position, and we are making a very sincere effort in both places.

You know, there has been some newspaper advertising in New York State under the name of Citizens Committee Against No-Fault. We have some evidence that at least some trial lawyers have supported that effort. It is probably too late for us to do anything effective in the way of advertising in New York, but it is not too late in Florida. As a matter of fact, we are running some ads in Florida today. I don't know that you want to introduce this in the record, but at least we will make it available to you.

Senator HART. For the file at least.

Mr. JONES. We are running them in support. We are sincerely trying to get some enactments there. In Florida the house insurance committee has reported a good no-fault bill. It is a substantial reform at a substantial savings.

The Senate has reported a bill that is no-fault only in name, not in any substance. They retained all lawsuits very carefully; and that would not be acceptable. But we do have a good House bill.

Unfortunately we got a setback yesterday. It was on the calendar for Monday, but it has to have a special order of the Rules Committee for it to be considered on the calendar on Monday, and the Rules Committee yesterday denied that special order by a vote of 14 to 12. The reports are that there are trial lawyers from all over the State around the capitol, and although the Speaker who named the Rules Committee had said that the House Insurance Committee bill will receive floor consideration on Monday, his Rules Committee didn't back him up.

I don't know whether the Speaker will be able to change that or not. But this was a disappointment because it is a good bill.

Senator HART. We heard about the New York advertising campaign, and in fairness to everybody that has been involved in these hearings, I should ask you to provide for us the same figures that I asked the

American Trial Lawyers to provide and I asked Mr. Kemper to provide.

Would you advise us for the record how much money you will spend or intend to spend or will have spent at the end of your anticipated Florida campaign?

Mr. JONES. Not just what we have spent on this?

Senator HART. I guess in fairness I should ask you to advise us the total expenditures you have made in attempting to persuade through advertising and lobbying, to use a word that is always misunderstood, in the advocacy of no-fault.

Mr. JONES. This is our first effort at advertising, and this ad we are running in 17 newspapers in 13 cities. I don't have the bills in exactly, but it is going to be about \$23,000. We are spending about \$2,500 on a few billboards down in Florida. Those are my only commitments now, and I couldn't tell you what the expenditures will be at the end of the Florida program.

Senator HART. Do you have any hospitality suites?

Mr. JONES. No, sir.

Senator HART. No expenditure there? And you will provide a precise figure for the record as to the total of the Florida campaign.

Mr. Jones. All right, Senator.

(The information follows:)

The total expenditure was \$66,000.

Senator HART. The second question, and the last for me. You suggest that we observe the progress in Florida and Pennsylvania to see whether genuine reform can be achieved at the State level. Do you regard the Illinois plan as meeting that criteria of genuine reform?

Mr. JONES. No, Senator, we would say—you made the observation yourself—the Illinois plan is a definite improvement over the present system, no question about it, and prior to having the benefit of the Department of Transportation report and Secretary Volpe's testimony we might very well have felt that it was a step worth taking.

We did in the end support the Massachusetts bill, although we stayed with our own bill as long as we could. Now, I guess our expectations—we feel we are entitled to greater expectations, and I think we would be disappointed if that is all we got in Illinois.

There are three other States that are considering legislation along that line now. California is in about the same category as are Michigan and Delaware. New York is weaker. The bar association is—the Hughes-Crawford bill—is the one that is receiving the most attention at the assembly in New York, and that retains all lawsuits, it has no cost reductions whatsoever.

If a man elects to purchase the first party no-fault benefits that would be available and which we would be required to offer to him, then he would increase what he pays for automobile insurance.

We are sure that would be a great disappointment to the citizens and a mark against the industry if that sort of legislation was all that came out.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. Thank you, Senator.

Mr. Jones you have before you the two charts previously discussed with Mr. Baylor, representing the Governor of Illinois. Since you were present in the audience when we went through that exchange, I

won't ask that we go through it again. I know that your organization has done an extensive amount of costing of various reform proposals and would offer you the opportunity to comment now, if you wish, and would appreciate the best approximation of figures that you can provide the committee for the various plans.

If you wish to add the AIA plan in addition to that represented as S. 945 and the Ogilvie plan, please feel free to do so. I also would like to point out that in S. 945 we have asked you to assume that it has been modified to include property damage coverage on a first-party basis which was one of the points which you suggested in your testimony.

In that connection, the criticism that you apply to the investigation cost resulting from property damage liability, the residual property damage liability in S. 945, does that same kind of criticism in terms of the inability to affect cost savings apply to the Illinois plan?

Mr. JONES. Yes. You would still have to retain more of the investigative process if you retained the subrogation right, intercompany subrogation procedures.

Senator, I think you would be interested in this, if I may. One of our member companies that writes very heavily in the State of Massachusetts has kept records during the first 4 months of this year as to the amount of money that his company has paid out to other insurance companies through subrogation, and the amounts paid to his company by other companies by way of subrogation. He said he is exactly \$1 ahead—\$1, out of all of this shifting of money back and forth and the people involved in doing it.

Mr. SUTCLIFFE. How much did that cost consumers for all that shifting?

Mr. JONES. He could hardly break that out, but this is one of the major savings we hope to achieve by a complete no-fault system. I can break this figure out for you. When we did our study in 1968, early in 1968, our claim administration expense was 12½ cents of the premium dollar—12½ percent of the premium on BI, bodily injury. You get confused if you try to apply this to the total premium, but just that particular coverage it cost us 12½ cents out of each dollar.

We initially reduced that in the first year, in our cost estimates, our assumptions, to 9 cents because there was a very substantial retraining expense; with new procedures, it takes time to adjust the personnel. you still have the personnel around that you have to shift to some place else, so we couldn't bring it down right away. Then their projections were that in a reasonable transitional period they could bring it from 9 cents down to 5 cents and from there it would depend a whole lot on the exact form that the system took as to how efficient you could become below that.

There was some hope the system would get where we could bring that down to 3 cents of the premium dollar to handle the personal injury claim.

Now, if we retain the investigative process for purposes of adjusting these costs back and forth between the companies, that would be merely deteriorated. I don't even know that they would say we could go to 9 cents in the first year. I am sure they wouldn't say we could go to 5 cents after the transitional period, because we would be retaining an expense of people, files, et cetera.

We administer these intercompany arbitrations—it is one of the biggest arbitration systems in the world and hundreds of thousands of cases a year. But, you know, a representative does have to come in from each company and sit down with his file, and they go through a number of them on a given day, and it is better than court procedures, but it is still people who are involved: There are reports, becoming familiar with the file, discussing the file with each other, and so forth, and if they can't agree, getting a third person to make the agreement for them.

So, it is highly desirable, we believe, for the system not to have that feature retained.

Mr. SUTCLIFFE. Mr. Jones, let me ask you one question. If for political reasons, reflective of public demand, some kind of compensation is requested for intangible loss, pain, and suffering, general damages, would your companies be willing to write that kind of coverage on a first-party basis?

Mr. JONES. Yes.

Mr. SUTCLIFFE. Even if it were a mandatory coverage?

Mr. JONES. Yes. We have considered it. We never attracted much attention to a proposal which we made in our plan when we first announced it, whereby you got automatically, as pain and suffering payment, 50 percent of your medical expenses on a first-party basis. There was no dispute about it; it was automatic. We felt there would be some public pressure. We think this is wrong, but we are going to put it in.

Senator Hart, I would like to add that at the time, I was seeing a doctor fairly regularly, a back doctor, and he argued against this, and we ultimately took it out. He said the medical profession had too many people coming in making extra visits following an automobile accident for purposes of building up the damages, and that if we paid their doctor's bill plus 50 percent more, then it was a bad system, and our committee eventually abandoned this approach.

What we would prefer to do is establish a schedule of benefits, and we think we could do this on the basis of experience very well. We could go to the system recommended by the British Columbia Royal Commission, which was that of an administrative procedure, an administrative body. You would go for the intangible award before some administrative tribunal. That was not enacted. That is just the Royal Commission's recommendation.

Mr. SUTCLIFFE. Without regard to fault?

Mr. JONES. Yes. That was without regard to fault.

We would strongly urge that you not consider a system where you get two lawyers involved who are not experts on pain and suffering but who are experts at bargaining and negotiations and let them argue about what that amount should be before a judge who is not an expert on pain and suffering and using a jury as a tool in the negotiating process.

We can't believe that it should be done in that way; there are many other ways that it could be done, and a number of our companies have felt, from the beginning, that we might have to do this.

Mr. SUTCLIFFE. One final question, although there may be some additional for the record. You have argued against formalizing the rating procedures which your insurance companies would use, the levels

of premium for collision coverage of automobiles that hopefully had increased property loss reduction characteristics.

How would you assure this committee that any cost savings resulting from the promulgation of property loss reduction standards would be passed on to the consumer in the form of reduced premiums?

Mr. JONES. We think the whole rating and rate review process is operating in this way at this time. There is great public pressure against rate increases and for rate reductions. We think that the committee could rely on this pressure.

Senator Hart, we are making very substantial progress in changing our rating organizations to rate service organizations that are furnishing information to the companies, and we have gotten competitive rating laws in 11 States, and if the Governor signs the Nevada code, it will be 12 States. Director Baylor is one of them. We have to acknowledge that Director Baylor and the commissioner of California have expressed criticism against the companies in not moving more promptly and more dramatically in changing their rating classifications and rating procedures, but let me assure you that they are moving. There is a lot of movement.

They are aware of what Director Baylor is saying, and they are aware of what Commissioner Barger is saying. In fact, four of the commissioners came to our annual meeting last year and said it very forcefully. Next week the American Insurance Association is having their annual meeting in New York, and the second day, the program is directed to pricing the insurance product.

We have a professor from the University of Pennsylvania, Professor Williamson, who is an authority on pricing in the American economy. I am not sure that he has been or hasn't been a consultant to the Senate Antitrust and Monopoly Subcommittee. He is going to make a presentation on pricing theory with applications to the property casualty insurance industry on Wednesday, and we are going to have an extensive discussion of it.

I think of the Aetna Life & Casualty All Driver Plan that they have put in successfully in a number of States, including Illinois, Director Baylor's State, and some other things that are developing independently in different companies, and I think you are going to see the automobile insurance system operating with new ways and new methods, particularly if we have this no-fault plan which will make it so much more adjustable to the driver you are insuring and open up markets.

We will no longer be concerned with what kind of appearance the man might make in court if he becomes a defendant or what kind of a witness he might make. All of those things will go by the board. We are just talking about a man and the kind of car he has and the kind of environment in which he drives; that determines his exposure to damages, and we can rate very well on that sort of a basis, within much broader categories.

I think these things are working.

Mr. SUTCLIFFE. Thank you.

Senator HART. Mr. Gilmore, is there anything you care to add?

Mr. GILMORE. No, sir.

Senator HART. Mr. Stark?

Mr. STARK. Mr. Chairman, I would like to take advantage of you for another moment, please, from the vantage point of some years in the claims field, a great part of which was spent in the Chicago area, and add something for the record that I think might be helpful.

It is not logical to use the disposition of a policyholder claim for his \$100 deductible in the collision field, as an analogy to determine what his conduct might be in terms of restricting his rights to pursue general damages. The analogy will not hold up very well because the system of intercompany arbitration that presently exists takes care of the \$100 deductible for that individual at the same time determination is made against the third party insurer to pay.

So, if a claim of \$500 is being asserted by the collision carrier against the wrong doer's company and \$400 of it has been paid by the company and a hundred dollars has been paid by the policyholder, the determination in favor of the collision carrier will carry with it a total verdict of \$500. In many of these cases where there is collision coverage, the recovery is being made through this intercompany arbitration process at no cost to the insured who gets back his \$100.

I grant you there are areas involved where that \$100 is not recovered because of the lack of an intercompany arbitration agreement, but it happens that the system which is so extensive now, involving all companies—stock, mutual, reciprocal—nationwide—that it covers a vast amount of this type of loss residual to the policyholder.

Another point I would like to make respecting the Illinois plan and other plans like it, is that any attempt to circumscribe general damages by limiting the recovery to 50 percent, if up to \$500 medical, limiting the recovery to 100 percent, if above \$500 medical, is bad, because it preserves the same incentives that exist in the present system to beef up the medical, the same kind of hanky-panky that I have seen through many years of experience in the claims business.

If you are up to \$350 in medical and it is legitimate, there is going to be a big push to get it up to \$501 so there can be a general recovery for pain and suffering rather than just \$350. It will incite lawyer activity. It will incite some of the unscrupulous aspects that pervade the present system. It will not eradicate the incentives that are constantly causing extra costs to be paid under this present system that maintains a wasteful and sham front of giving people money in addition to their economic loss, particularly in a small case where they don't deserve it at all.

So, I don't think the claim made for savings related to circumscribing of general damages in this particular plan or others like it—can be given the kind of credibility that the proponents of that plan would desire you to give it, because there are lots of intangibles.

The remainder, the residual of the cancerous system that has caused the present tort liability area in auto accident reparations to be so criticized and so condemned, that same cancerous system is left there and we will have the same kind of abuse, exaggeration, distortion, and overclaiming for the sake of getting that extra buck. We may knock out many of the activities of some of the bar who engage in this, but believe me there will be a residual number who will be working for the \$100, \$200 and \$500 fee in an effort to get the extra sum.

Senator Hart. Thank you for adding that to the record, and I know you speak from a background of years of experience in the field.

I think Mr. Sutcliffe wanted to ask Mr. Stark a question.

Mr. SUTCLIFFE. Mr. Stark, in the Massachusetts plan and in the Illinois plan where interinsurer subrogation is provided, there is a provision requiring that the claims cost as well as the wrongdoers damages be compensated to the company whose policyholder has found to be innocent of any wrongdoing.

Does that indicate itself the magnitude of the claim cost that will still be inherent in the Massachusetts and Illinois plans?

Mr. STARK. Yes, there is what we call an allocated or unallocated loss adjustment expense that is going to be shifted along with the actual payment of a claim.

Mr. SUTCLIFFE. If that were an insignificant amount, there would be no reason to provide for reimbursement of that, is there?

Mr. STARK. That is correct. It is not a large amount. Perhaps it is going to be used on some formalized basis. The point is it does add to the loss. In other words, aside from what is paid to an injured person, it will add to that amount, whether it be 5, 10, or 15 percent, an additional sum floating back and forth.

Mr. SUTCLIFFE. Not only will it add, but it must be an indicator that there will be those costs within that procedure?

Mr. STARK. Oh, I think so.

Mr. GILMORE. Senator Hart, I would just like, if I may, to very briefly amplify the remarks that Mr. Jones made in talking about our plan, as originally submitted, making some payments for what I might call noneconomic losses. Actually, this was confined only to cases where there was a disfigurement or an impairment. And under our plan as originally presented, we would pay in those cases an amount not exceeding 50 percent of the medical expenses. We never did have in any of our plans what you might call a general across-the-board pain and suffering allowance such as there is in Illinois plan. Ours was very limited and could be compared to the provision in your bill dealing with catastrophic harm except under our program originally submitted it would have been on a no-fault basis.

Senator HART. We are having trouble with the definition or the section that you mentioned, I don't have the bill here, the catastrophic section. If you could give us any help on that, it would help us.

Mr. GILMORE. Actually we thought it was somewhat better in this draft than it was in the bill introduced at the last session. We have had a lot of trouble with this, and this is one of the reasons why we abandoned what could be called a rather modest payment for disfigurement.

Mr. JONES. Senator, we had trouble with it before you ever tried to draft a section along this line, and you did better than we did.

Senator HART. The draftsman did.

Gentlemen, thank you very much.

Is there anything that is a loose end that you would like to include? The record will remain open.

Mr. JONES. I can ask Mr. Sutcliffe for a clarification of one of the lines of his chart.

Senator HART. Yes. Because it bears on the table that Mr. Jones has attached as an exhibit, the progress report on the State legislative actions, let me add to the record at this point a memorandum that was prepared by the National Conference of Commissioners on Uniform State Laws, dated April 13, 1971. It was provided to the Congressional Research Service of the Library of Congress. It tabulates in very understandable and interesting style what has happened to the several uniform State laws that the Commissioners on Uniform State Laws have developed over the years.

In some cases there is very broad acceptance across the country within a period of a very few years and in other cases many years with very few takers.

Mr. JONES. One State that we had great hopes for this year was Minnesota. We have a very able advocate up there, State Senator Jack Davies. He, for 3 years, had a bill before the Minnesota Legislature. They are well educated on the subject and well acquainted with the subject.

The DOT material was made available to them. Notwithstanding that, we couldn't get his bill reported this year. Senator Davies has not given up, but our people who follow the legislation in Minnesota, they have become encouraged just as the Minnesota Star did, and I would like to leave for the record an editorial from the Minnesota Star of May 3.

Senator HART. Thank you.

That will be made a part of the record.

(The editorial follows:)

[The Minneapolis Star, May 3, 1971]

A FEDERAL INSURANCE APPROACH

NO-FAULT auto insurance legislation appears dead in this session of the Legislature.

Trial lawyers and lobbyists for some segments of the insurance industry have done their work well. The smokescreens they raised have been thick enough to obscure the promises of two major insurers to reduce premiums 10 to 40 percent under a no-fault system, as well as the Minnesota Poll this month which showed that 55 percent of state auto owners questioned said they were in favor of such a system.

Perhaps it is just as well. We always have had serious doubts about the possibility of pushing meaningful auto insurance reforms through the legislatures of 50 separate states. The federal approach—with Congress passing no-fault legislation for this country as a whole—would, we believe, be a simpler, swifter way to solve a problem that is of increasing concern to consumers.

The Nixon administration came close to this approach last month, but backed off under pressure from some insurance companies. A three-year Department of Transportation study made a strong recommendation for a mandatory, national system of no-fault auto insurance. But in presenting the report to a Senate committee, Transportation Secretary Volpe suggested only "national goals" for insurance reform by the states, and did not set any penalty deadline.

The federal approach is not dead, however. No-fault legislation has been introduced in the House and Senate, and hearings are being conducted. The consumer-motorist might have his innings yet.

(The appendix to the statement follows:)

**EXHIBIT TO STATEMENT OF T. LAWRENCE JONES, PRESIDENT OF
AMERICAN INSURANCE ASSOCIATION**

SUMMARY OF STATE NO-FAULT AUTO INSURANCE LEGISLATION 1969-71

1971

| State | Plan | Action |
|-----------------------|-------------------------------------|---|
| Alaska: | | |
| House 25 | AIA plan | Reported in the House. |
| Arizona: | | |
| House 316 | Massachusetts plan | No action. |
| House 217 | Partial no-fault plan | Do. |
| California: | | |
| House 117 | do | Do. |
| House 1030 | Massachusetts plan | Amended and recommitted in House. |
| House 1505 | Partial no-fault plan | No action. |
| Senate 515 | AIA plan | Do. |
| Colorado: | | |
| House 1221 | Partial no-fault plan | Died. |
| House 1357 | do | Do. |
| House 1358 | Keeton-O'Connell plan | Do. |
| House 1483 | Partial no-fault plan | Do. |
| Connecticut: | | |
| Senate 571 | Massachusetts plan | No action. |
| Senate 899 | do | Do. |
| Senate 702 | AIA plan | Do. |
| Senate 1048 | Partial no-fault plan | Do. |
| Delaware: | | |
| House 4 | do | Reported in the House. |
| House 90 | AIA plan | Do. |
| House 133 | Partial no-fault plan | Do. |
| Florida: | | |
| House 1821 | Partial no-fault plan (Rep. MacKey) | Do. |
| House 168 | Keeton-O'Connell plan | Do. |
| House 65 | AIA plan | Do. |
| House 322 | Davies plan (similar to AIA) | Do. |
| House 695 | Partial no-fault plan | Do. |
| Hawaii: | | |
| House 181 | Davies plan (similar to AIA) | Do. |
| House 1417 | Partial no-fault plan | Do. |
| Senate 1279 | AIA plan | Do. |
| H.C.R. 93 | Study bill | Reported in House. |
| Illinois: | | |
| House 2115 | Keeton-O'Connell plan | No action. |
| Senate 263 | Partial no-fault plan | Do. |
| Senate 976 | do | Do. |
| Indiana: | | |
| House 1416 | Keeton-O'Connell plan | Died. |
| Senate 640 | Partial no-fault plan | Do. |
| Kansas: | | |
| House 1356 | Davies plan (similar to AIA) | No action. |
| H.C.R. 1037 | Study proposal | Passed in House, reported in Senate. |
| Maryland: | | |
| House 151 | Massachusetts plan | Died. |
| Massachusetts: | | |
| House 1530 | Repeal of partial no-fault law | No action. Several other bills pending affecting no-fault provisions. |
| Michigan: | | |
| Senate 4 | Keeton-O'Connell plan | No action. |
| S.R. 45 | Study proposal | Do. |
| House 4847 | Partial no-fault plan | Do. |
| House 4734 | do | Do. |
| Minnesota: | | |
| Senate 568 | Davies plan (similar to AIA) | Killed in Senate subcommittee. |
| House 724 | do | Do. |
| House 1737 | Partial no-fault plan | Do. |
| House 2740 | Study bill | Do. |
| Missouri: | | |
| House 924 | Massachusetts plan | Do. |
| Montana: | | |
| H.J.R. 29 | Study proposal | Now law. |
| House 451 | AIA plan | Died. |
| Nevada: | | |
| Senate 301 | do | Do. |
| New Jersey: | | |
| House 829 | Study proposal | Now law. |
| House 2302 | Partial no-fault plan | No action. |
| New Mexico: | | |
| H.J.M. 13 | Study proposal | Now law. |
| Senate 224 | Partial no-fault plan | Died. |
| House 135 | Puerto Rico plan | Do. |
| New York: | | |
| House 675 | Partial no-fault plan | Third reading in House. |
| Senate 4400 | Partial no-fault plan (Sen. Gordon) | Reported in Senate. |
| Senate 4850 | N.Y. Insurance Department bill | No action. |
| Senate 5792 | AIA plan | Do. |

| State | Plan | Action |
|--------------------------|--------------------------|------------------|
| North Dakota: | | |
| S.C.R. 4028 | Study proposal | Now law. |
| S.C.R. 4029 | do | Do. |
| Senate 2479 | Partial no-fault plan | Died. |
| Ohio: House 381 | do | No action. |
| Oklahoma: House 1270 | AIA plan | Do. |
| Oregon: | | |
| House 1851 | do | Tabled in House. |
| House 1300 | Partial no-fault plan | No action. |
| S.J.R. 19 | Study proposal | Do. |
| Pennsylvania: | | |
| H.R. 34 | do | Do. |
| House 542 | Partial no-fault plan | Do. |
| House 37 | Constitutional amendment | Do. |
| Rhode Island: House 1470 | Massachusetts plan | Do. |
| Tennessee: | | |
| H.J.R. 119 | Study proposal | Do. |
| S.J.R. 53 | do | Do. |
| Texas: H.C.R. 110 | do | Do. |
| Washington: | | |
| House 230 | Partial no-fault plan | Do. |
| Senate 654 | Keeton-O'Connell plan | Do. |
| House 696 | Study proposal | Passed in House. |
| West Virginia: | | |
| House 1209 | AIA plan | Died. |
| Senate 423 | Partial no-fault plan | Do. |
| S.C.R. 15 | Study proposal | Do. |
| Wisconsin: House 373 | Massachusetts plan | No action. |
| Congress: | | |
| House 7514 | Moss proposal | In committee. |
| Senate 945 | Hart proposal | Do. |

1970

| | | |
|----------------------------|--------------------------------|---|
| Alaska: House 809 | AIA plan | Died. |
| California: | | |
| Senate 797 | do | Do. |
| House 1450 | Partial no-fault plan | Do. |
| H.R. 146 | Study proposal | Do. |
| Hawaii: | | |
| House 1932 | AIA plan | Do. |
| Senate 1812 | do | Do. |
| Senate 1959 | State fund | Do. |
| House 1334 | Keeton-O'Connell plan | Do. |
| Massachusetts: | | |
| House 1928 | AIA plan | Do. |
| House 610 | Keeton-O'Connell | Do. |
| House 611 | do | Do. |
| House 6041 | Partial no-fault plan | Do. |
| Senate 1430 | do | Do. |
| Senate 1580 | do | This is the partial no-fault bill which became law. Effective Jan. 1, 1971. |
| Senate 500 | do | Died. |
| New York: | | |
| House 842 | Keeton-O'Connell plan | Do. |
| House 6013 | Partial no-fault plan | Do. |
| House 6133 | N.Y. Insurance Department bill | Do. |
| Senate 8849 | AIA plan | Do. |
| Pennsylvania: | | |
| H.R. 197 | Study proposal | Do. |
| House 2279 | Constitutional amendment | Do. |
| Rhode Island: Senate 791 | Keeton-O'Connell plan | Do. |
| West Virginia: H.C.R. 8-XX | Study proposal | Do. |
| Congress: Senate 4339 | Hart proposal | Do. |

1969

| | | |
|--------------------------|---|-------------------------------------|
| California: | | |
| Senate 116 | Keeton-O'Connell plan | Died. |
| Senate 1141 | Partial no-fault plan | Do. |
| Colorado: House 1466 | Keeton-O'Connell plan | Do. |
| Connecticut: House 6763 | Partial no-fault plan | Do. |
| Delaware: House 335 | do | Do. |
| Illinois: House 402 | Keeton-O'Connell plan | Do. |
| Massachusetts: | | |
| House 4439 | do | Do. |
| House 1909 | Partial no-fault plan | Do. |
| House 4440 | do | Do. |
| Michigan: Senate 1022 | Keeton-O'Connell plan | Do. |
| New York: Senate 2803 | do | Do. |
| Rhode Island: House 1144 | do | Do. |
| Wisconsin: Senate 204 | do | Do. |
| Puerto Rico: Senate 334 | Postponed to Jan. 1, 1970, the effective date of the Automobile Accident Social Protection Act (a partial no-fault plan) which became law in June 1968. | Enacted, effective on Jan. 1, 1970. |

NATIONAL CONFERENCE OF COMMISSIONERS ON
UNIFORM STATE LAWS,
Chicago, Ill., April 13, 1971.

1. UNIFORM ADOPTION ACT

1. Proposed, 1949. Approved, 1953.
2. First adoption, 1957.
3. The Act was adopted in only 2 states and in 1967 a committee was appointed to review the Act. A revised Uniform Adoption Act was approved in 1969.

2. UNIFORM COMMERCIAL CODE

1. Proposed, 1940, that Code should be undertaken as soon as funds were available. Drafting commenced, 1943. Approved, 1951.
2. First adoption, 1953.
3. The Code has been adopted in every jurisdiction except Louisiana.

3. UNIFORM CONTRIBUTION AMONG TORTFEASORS ACT

1. Proposed, 1936. Approved, 1939.
2. First adoption, 1940.
3. The Act was adopted in 11 states. In 1952 a committee was appointed to review the Act. A revised Uniform Contribution Among Tortfeasors Act was approved in 1955 and has been adopted in 5 states.

4. UNIFORM CRIMINAL EXTRADITION ACT

1. Proposed, 1921. Approved, 1926.
2. First adoption, 1927.
3. The Act was adopted in 16 states. In 1930 a committee was appointed to review the Act. A revised Uniform Criminal Extradition Act was approved in 1936 and has been adopted in 39 jurisdictions.

5. UNIFORM DIVORCE RECOGNITION ACT

1. Proposed, 1946. Approved, 1948.
2. First adoption, 1949.
3. The Act has been adopted in 10 states.

6. UNIFORM INSURERS LIQUIDATION ACT

1. Proposed 1934. Approved, 1939.
2. First adoption, 1939.
3. The Act has been adopted in 28 states.

7. UNIFORM LIMITED PARTNERSHIP ACT

1. Proposed, 1914. Approved, 1916.
2. First adoption, 1917.
3. The Act has been adopted in 46 jurisdictions.

8. UNIFORM MOTOR VEHICLE CERTIFICATE OF TITLE AND ANTI-THEFT ACT

1. Proposed, 1951. Approved, 1955.
2. First adoption, 1957.
3. In 1958 the provisions of this Act were incorporated into the Uniform Vehicle Code promulgated by the National Committee on Uniform Traffic Laws and Ordinances and we do not have a breakdown of the states that have adopted those portions.

9. UNIFORM PARTNERSHIP ACT

1. Proposed, 1912. Approved, 1914.
2. First adoption, 1915.
3. The Act has been adopted in 43 jurisdictions.

10. UNIFORM RECIPROCAL ENFORCEMENT OF SUPPORT ACT

1. Proposed, 1948. Approved, 1950.
2. First adoption, 1951.
3. This Act has been adopted in all jurisdictions.

11. MODEL ANTI-DISCRIMINATION ACT

1. Proposed, 1963. Approved, 1966.
2. First adoption, 1967.
3. This Act is a Model Act and the Commissioners are not obligated to press for its adoption. The criteria for Model Acts is that where, in the judgment of the National Conference, uniformity between the states on a subject is not necessary or desirable, but where it would be helpful to have legislation which would tend toward uniformity where enacted, acts on such subjects are promulgated as Model Acts. While we understand the Anti-Discrimination Act has been used as a model for legislation in a number of states, we have been advised of only 2 states where it has been enacted in its entirety.

12. UNIFORM DECEPTIVE TRADE PRACTICES ACT

1. Proposed, 1961. Approved, 1964.
2. First adoption, 1965.
3. The Act was adopted in 5 states. In 1966 an amendment to 1 section of the Act was approved and the Act as amended has been adopted in 9 states.

13. MODEL DEFENSE OF NEEDY PERSONS ACT

1. Proposed, 1963. Approved, 1966.
2. First adoption, 1967.
3. In 1970 the Act was revised to supplant the county option approach with one that centralizes responsibility in a single state public official and the name of the Act was changed to Model Public Defender Act.

14. UNIFORM MARRIAGE LICENSE APPLICATION ACT

1. Proposed, 1948. Approved, 1950.
2. First adoption, 1951.
3. This Act was adopted in only 1 state and was withdrawn, it appearing that existing legislation in most of the states was adequate.

15. MODEL RULES GOVERNING PROCEDURE IN TRAFFIC CASES

1. Proposed 1956. Approved, 1957.
2. First adoption, 1958.
3. The Rules have been adopted in 10 states.

Senator HART. We will recess while I take a phone call.

(Short recess.)

Senator HART. With apologies for having held them so long, we welcome the spokesmen of the Automotive Service Industry Association, Mr. Harold Halfpenny, their counsel whom we have heard before and are delighted to see again.

STATEMENTS OF HAROLD T. HALFPENNY, LEGAL COUNSEL, AUTOMOTIVE SERVICE INDUSTRY ASSOCIATION, HALFPENNY, HAHN & ROCHE, CHICAGO, ILL.; ACCOMPANIED BY WILLIAM F. RAMP, DIRECTOR OF MARKETING, ALEMITE INSTRUMENT DIVISION, STEWART-WARNER CORP., CHICAGO, ILL.; AND MARVIN RICHER, ENGINEER, DIVISION OF APPLIED POWER INDUSTRIES, BLACK-HAWK MANUFACTURING CO., MILWAUKEE, WIS.

Mr. HALFPENNY. Thank you, Senator.

I have had the privilege of appearing before you a number of times and in committees you have chaired, and we appreciate your efforts on behalf of the various segments of the automotive industry.

My name is Harold T. Halfpenny, I am a partner in the law firm of Halfpenny, Hahn, & Roche with offices at 111 West Washington

Street, Chicago, and am here as general counsel for Automotive Service Industry Association. With me are William F. Ramp, Jr. of the Stewart-Warner Corp., Chicago, and Mr. Marvin Richer of Applied Power Industries, Inc., Milwaukee.

Both of these men are experts in the field of periodic motor vehicle inspection, diagnostic systems and so forth.

Due to the lateness of the hour, Senator, I will make a few brief remarks and request that my comments be put in the record so the committee will have the benefit of these two men that are real experts in the field.

Senator HART. Let's order the statements of all three printed in the record in full and proceed as you like.

Mr. HALFPENNY. We appear on behalf of Automotive Service Industry Association, a national trade association with over 5,000 members engaged in various phases of the automotive aftermarket. These members are independent manufacturers, remanufacturers, warehouse distributors, heavy-duty distributors and wholesalers of automotive replacement parts, equipment, tools, chemicals, paint, refinishing materials, supplies, and accessories.

Our concern is with the effect of this bill on the replacement parts industry, and on the driving public which is the ultimate concern for us, for the vehicle manufacturers, and for Congress.

We will divide our discussion among us. Mr. Ramp and Mr. Richer will give our suggestions on diagnostic and periodic motor vehicle inspection. I will make some general observations on other sections of the bill.

First, certain testimony before this committee makes it appropriate for me to give a very brief description of the replacement industry. That is the testimony of Ralph Nader—as quoted in the newspapers—that the auto industry “coldly and with slide rule precision” has produced cars that need repairs so often that it creates a multibillion dollar replacement market “marked by enormous and monopolistic company markups” on parts.

I want to point out that this portrayal of “monopolistic” firms in the replacement industry is untrue and is refuted by the industry statistics. The only statistics on manufacturers of replacement parts are those assembled by Automotive Service Industry Association. While only ASIA members contribute to these statistics, they include the larger parts manufacturers, aside from the vehicle manufacturers, who are not members.

These figures are representative of the industry as a whole. Forty-five percent of ASIA manufacturer members have annual gross sales of less than \$1 million; 78 percent less than \$5 million; 86 percent less than \$10 million, and only 1 percent have more than \$25 million.

If they are talking about markup on parts, if the witness intended to refer to wholesalers, the figures are similar. According to the 1967 U.S. census, 85½ percent of all wholesalers had an annual volume of less than \$500,000; less than 1 percent had over \$5 million.

The business of these wholesalers was described by testimony summarized by the Court of Appeals for the Eighth Circuit (*Moog Industries*, 1956). “Their business is keenly competitive and consists of the sales of thousands of items at small margins of profit.”

In short, the replacement industry is not composed of grasping giants, but of small businesses doing their best to supply the needs of the motoring public for the parts necessary to keep their cars running.

Turning from the industry to the bill now under consideration, let me suggest that the concept of "property loss reduction" standards is one which should be approached with great caution, and with a keen appreciation of the fact that it would change the basic philosophy of the Traffic and Motor Vehicle Safety Act.

The act as it now stands authorizes the setting of "motor vehicle safety" standards, which are aimed at preventing the unreasonable risk of accidents and particularly risk to persons of injury or death resulting from such accidents. This has been accepted as legitimate matter for public concern, and for governmental regulations.

S. 976 would enter an entirely new field by authorizing "property loss reduction" standards, aimed at reducing the "economic loss suffered by the public as a result of property damage to motor vehicles involved in accidents."

We submit that this drastic change of direction should not be undertaken without serious consideration of the basic question: Is it an appropriate exercise of national power to interfere with the freedom of choice of the motoring public, and with the business judgment of the automobile industry, solely in order to reduce property damage?

In this connection, it is doubtful whether the insurance companies need any protection. A study undertaken on behalf of the Senate Antitrust and Monopoly Subcommittee in 1968 concluded that the insurance companies are making "exceptional profits" despite their claims to the contrary. As for a possible reduction in premiums paid by the motorist if there were a reduction of property loss—this would be a long and uncertain process.

Turning to specific provisions of the bill, we offer the following comments:

We are concerned with the section (sec. 5, adding sec. 128 to the Motor Vehicle Act) providing that the Secretary shall promulgate motor vehicle safety and property loss reduction standards requiring that all motor vehicles manufactured after January 1, 1975, be "so designed and constructed as to facilitate motor vehicle inspection, and to facilitate the repairs necessary to meet the requirements of such inspections."

This provision is unrelated to either motor vehicle safety or property loss reduction. It is suggested that it does not come within the general purposes of either the Motor Vehicle Safety Act or of S. 976.

We are also concerned with the difficulty of limiting "property loss reduction standards." We would object to any requirement that parts be radically changed by legislative fiat instead of the objective knowledge of dedicated engineers and designers.

Senator, ASIA has always supported periodical motor vehicle inspection, and has worked actively to promote it. Our objections are made from a practical point of view rather than in protest against the basic requirement of inspection.

From that point of view, the number of inspections required would be almost impossible to perform adequately. Further, they would be so burdensome and expensive that the motoring public would react against the entire program. For example, if a man purchased a new

car, was involved in an accident, and thereafter sold the car, he could be subject to three inspections within a very short time.

One of the things that we are very concerned about is section 501 (a) (2) which would have drastic consequences. This is the provision that no inspector may own or receive any benefit from a business engaged in the repair or sale of motor vehicles, automotive repair parts or accessories. This would disqualify hundreds of thousands of garages, service stations and car dealer repair shops from performing inspections. This is the group best qualified to so act. In turn the inspection function would be thrown into the hands of only persons who could finance expensive equipment. This would make the cost of inspections very high, and would drain trained mechanics away from the repair of vehicles—where they are badly needed—and put them into the inspection business.

Now the two men that accompany me here will explore these facets of the bill, and we do appreciate this opportunity to express the views of the Automotive Service Industry Association.

First, Mr. W. F. Ramp, Jr., of Stewart-Warner, who, as I stated, has been in this business all of his life will make a statement.

Mr. RAMP. My name is William F. Ramp, Jr., and I am director of marketing in the Automotive and Instrument Division of the Stewart-Warner Corp., Chicago, Ill.

I appear before you with a 26-year background in the automotive equipment industry. I have been an equipment serviceman, equipment salesman, part owner of a small equipment business, and during the last 4 years have been directing the marketing and research and development of automotive equipment in the fields of lubrication equipment, wheel balancing and wheel aligning equipment, tire changers, headlight testers and aimers, and the development of diagnostic lane equipment and single bay diagnostic equipment.

I am asking that consideration be given for private industry to be a part of the worthwhile endeavor of periodic motor vehicle inspection because I feel that the inspection aspects of PMVI can best be handled by private industry.

May I preface the rest of this testimony by saying that, as an individual and as an executive in a corporation which makes equipment for the automotive industry, I commend this committee for its concern with motor vehicle inspection. As a taxpayer, husband, and father, I want to see safe automobiles on the streets and roads of America, and I am sure I speak for my industry in this regard.

I would like to address my comments to a particular portion of bill S. 976 and, as an equipment man, point out some facts of which I am sure you would want to be aware.

In your introduction of this amendment, I would specifically like to discuss title V, section 501S (a. pars. 1 and 2).

With due respect to you, Senator Hart, and in full agreement with this intent, I would like to point out that the above-mentioned paragraphs pose a formidable task for the taxpayers, whether at State or Federal level.

Based upon the millions of automobiles that are sold, both new and used, plus the collision statistics for each year, I am sure that the amount of inspections required would be in the many millions.

I am sure you are aware that the proper steps that have to be taken in diagnosing the ills of an automobile are formidable and require trained manpower and sophisticated and costly equipment. At this point in time, to my knowledge, the least expensive single bay diagnostic unit to accomplish this, completely equipped and installed, runs between \$12,000 and \$13,000. This type of unit utilizes an all purpose diagnostic lift with a built-in capability dynamometer, checking of alignment, check for balance, removal of wheel for checking of brakes, headlight testing, and the inspection of the general condition of exhaust system and front-end parts of the automobile. It also contains an electronic motor analyzer for engine performance.

The equipment industry has run the gamut over the past few years of trying to design the very best at the lowest cost and the most accurate diagnostic equipment that we can design. We, as an industry, have spent millions in research and development for better equipment; but to be completely candid, we are very frustrated by the lack of standardization for meeting the requirements of the various statutes that exist throughout the country.

Let me cite an example. There are a few States that have procedures for checking the conditions of automobile brakes. One State says the wheels cannot be removed, another State says take the wheels off. In taking the wheel off to check for brake condition, you have a time factor that I believe the public cannot live with. If the wheel stays on, you have another problem. How, and at what speeds, do you determine the fade factor that shows wear of the brakes? There is equipment available today that will detect fade at speeds of 20 miles per hour; 30 and 40, and even 60 miles per hour. The low speed units are mechanical in nature and one high speed unit measures the coefficient of heat generated by the friction on the drum when the brakes are applied. Gentlemen, if you were an equipment manufacturer and willing to build equipment and spend the money for research and development which way would you go in designing brake testing equipment? If the American public is to be benefited by this or any other bill concerning periodic motor vehicle inspection, and meet the timetables as outlined, all the standards for the diagnostic guidelines must come quickly.

One of the most disturbing things, again with due respect to this amendment, is that we are basically saying that the present periodic motor vehicle inspection statutes of many States will be done way with; and also that all independent garage owners, service station operators, and new car dealers are banned from being a part of this nationwide inspection team.

Let me point out that although the automotive repair business has come in for criticism, for every bad one there are many good ones. There exists in America today a large cadre of experienced, honest businessmen and mechanics who are competent and should play a part in this endeavor. We recognize that already there exists a shortage of trained mechanics and our industry is doing everything in their power with the help of the cities and States, vocational schools, grants of Federal money, and on-the-job training. All of this effort is to build a larger group of trained young men. And we are making progress.

I would have no way to accurately calculate how many inspection stations would be necessary under this proposed amendment, but I

known that to properly staff the thousands necessary would deplete our already short supply of technicians.

To think of the cost to the taxpayers to implement this program staggers the imagination. Based on \$12,000 in equipment alone for just a single bay unit, not counting land costs and administrative and technician costs, I would estimate somewhere between \$1½ to \$2 billion. This would not include the cost of the more expensive special equipment required to determine whether a vehicle which has been damaged in a crash was properly repaired. This item would substantially increase the cost estimates given here.

With proper guidelines and whether administered by the Federal Government or delegated to the State, you have at your disposal a large group of competent, honest businessmen willing to invest their money, and you have a group of equipment manufacturers willing—as soon as we have the standards—to keep investing our moneys in designing and producing the equipment necessary to do the job.

All of us are at your disposal. I hope you will please call upon us so that together we can in the most economical way possible for the American taxpayer give to him competent periodic motor vehicle inspection.

Thank you, Senator.

Senator, the next speaker will be Mr. Richer, who, I feel, is probably the most qualified man in the country to discuss diagnostic centers. Although he is a young man, this is a young business, and he has had more experience than I think anybody in the entire industry.

Mr. RICHER. My name is Marvin Hans Richer, residing at S31 W24890 Green Valley Lane, Waukesha, Wis. For the past 12 years, I have been directly involved in the automotive service business. I began as a specialist mechanic, actually doing all the technical work necessary to correct and maintain a vehicle in safe and proper working order. In 1961, I started a business called Richer Automotive in Rochester, Minn., concerned with the maintenance and service of all types of vehicles. This business is in operation today and services 2,000 cars per year. In 1964, I joined the Mobil Corp.'s special projects division diagnostic center program.

I held various positions within the program from diagnostician to service manager. My employment at Mobil was due directly to my practical and working knowledge of automotive and automotive service centers. I had the experience of personal contact in the establishment of five service centers in the United States. I also had an opportunity to learn the economics of a national service business.

In 1969, I joined Applied Power Industries as a product planner. My direct responsibilities are concerned with the technical development and planning of new products and machines which are used to diagnose and repair automotive systems that have failed or been damaged in use. These service systems cover all aspects including collision damage repair, performance testing equipment, wheel, brake, electrical and major frame repair. Our products are also designed for tire service/repair, retreading, et cetera. In this work I am intimately concerned with the economics, cost and quality of the repair of vehicles. During this time, I have gathered a variety of specific and general knowledge and experience which I will be happy to share with you today.

Please feel free to ask any questions you may have and I will endeavor to answer them to the best of my ability.

I would like to share with you some of my observations on the technical and manpower requirements of your proposed bill. I hope that any information I may provide you with will enable you to draft and pass a just and fair bill to all concerned.

Let me begin by directing some comments to title V—diagnostic inspections, registrations, and titling standards.

Section 501, paragraph 1, seems unclear to me as to what is meant by "Safety Regulated Mechanism, Subsystem, or Functional Nonoperationl Part." For purposes of this discussion, let us assume that the reference made includes such things as the frame, or subframe, of an automobile. A damaged frame, if not correctly repaired, can seriously affect the handling qualities of an automobile. Therefore, such damage results in a safety-related mechanism not functioning properly, to the extent that the vehicle is actually unsafe to drive.

The method for detecting a frame problem requires a visual check by the mechanic as well as the use of somewhat sophisticated equipment, such as frame gages, wheel alinement equipment, and inspection devices which incorporate lights, and magnifying lenses. The type of individual who has the training and skill to run these machines and do this inspection would be an ex-body repairman.

If he also were required to estimate the cost of such repairs, he must have estimating experience. This particular segment of the industry is currently experiencing a serious problem in obtaining and retraining qualified repairmen. There is a question whether a sufficient number of trained personnel could or would be available within the next 5 years without a major national training effort. One of our corporate divisions, Bear Manufacturing Corp., runs such a training school in this technology and I am familiar with the details and conditions of teaching this skill.

Section 501, paragraph 2—the inspector referred to in this paragraph would be "trained to perform duty." My question—trained by whom? Training an individual to put marks on a check list is one thing, training a person to interpret what is unsafe or safe in a highly complex mechanical mechanism is quite another. At present, there is a severe lack of adequate facilities in addition to a lack of funds, Federal or otherwise to train such people.

The other major consideration in any technical service program is the manpower requirement. There are almost 100 million owned vehicles in use that do not have any built-in diagnostic compatibility to machines presently available, including the computer. Because of this, it is difficult to believe that anyone but a trained mechanic could do a thorough and accurate diagnosis on this vehicle population.

You must consider when someone suggests the use of mechanics as inspectors, that a good mechanic is earning considerably more than an inspector's position could pay today. Therefore, the type of individual available would not be the better repairman.

This presents a serious problem at the onset because one of the most significant goals that must be achieved if the system is to work, must be to insure its believability to the public in its early stages. If the centers were to be staffed with unqualified people initially, it would seriously damage the image of such a program in the long

range. It is also most certainly a necessary requirement that the technician involved be certified by some regulating agency.

This certification must also include a constant retraining program to insure a constant level of technical competence. The role of the Federal Government in such a certification program could be much the same as the present airplane repairmen, certified by the FAA, but trained by private or State agencies. However, the gross numbers of vehicles to be repaired when compared to aircraft is staggering and puts the automotive training program in an entirely different light.

The other major point of this paragraph deals with the motor vehicle inspector not owning or receiving any benefits from the repair side of the inspection. As written, it is somewhat vague as to the alternate solution to the inspection system you propose. As interpreted, this would involve State or privately owned certified stations through a given State which could devote their entire effort to inspection. Let's assume that the method to be used would be the State-owned inspection stations.

Presently, as outlined in your bill, the States would have the necessary incentives to establish such stations as soon as guidelines have been established according to highway safety program standard No. 1.

Referring to a study PB 195733 diagnostic center, vol. 1, done by Northern Research Engineering Corp., Cambridge, Mass., July 1, 1970, I quote:

If all motor vehicles are to be inspected only at diagnostic centers, it will be necessary to establish a greater number of new centers. Presently, there are about 286 existing in the U.S. Based on NREC's 1975 projections, the number of centers required to adequately inspect the vehicle population is about 7,000.

Using this same report, they estimate that the average cost of a building for such a center to be at \$10 a square foot in the extreme climate region.

I would like to add here I think this is very, very low—far too low.

Everything indicates that by the time that this program could be put into place, this cost would be significantly higher. Assume that the total cost of the building completed with a blacktop parking lot would be \$100,000, which does not include the cost of the equipment, furniture, forms, et cetera; the equipment for such a center would at present cost \$30,000 to \$35,000, plus installation.

When you add the cost of land and installation of such equipment, your total reaches nearly \$200,000 per center. This type of center would be one which you might find in a larger metropolitan area. Total cost of installing these 7,000 stations would range upward from \$1.5 billion. You must also consider that such a program would incur administrative costs of such magnitude that the \$1.5 billion is only a starting point.

The other question that would arise after such a State-owned and operated program would be implemented is what to do with the private inspection stations which are presently licensed by those States. These stations have invested thousands of dollars in equipment to comply with State regulations which would be changed. Such changes will, in effect, obsolete the private inspection station and, in addition, they would lose the income derived from such inspections.

Possibly all of my observations have been accounted for by your technical advisors, but in conclusion, I would like to restate my concerns with your manpower problems and requirements. It has been my direct and practical experience in training and supervising automotive diagnosticians that this type of work and the salaries commensurate will not attract trained mechanics; therefore, a training program on a very large and expensive scale will be necessary to accomplish before any part of it could function.

Thank you, Senator.

Senator HART. Thank you, and I particularly thank you, Mr. Richer, for the practical caution that you gave us.

You tell us, and properly, that if the system, as we visualize it, is to work, it has to be believable from the very early stages. At the very least your message should persuade those of us who are associated with the bill to be sure we don't advertise as producing something which in fact it won't be able to produce at least for a period of time.

That is one of the criticisms of the political system and it would be a fair criticism of this if we weren't careful.

Having said that, would you agree that what we should be attempting to do is develop a program or assist in the development of a program across the country which, whatever its cost, would be less than the benefits that honestly could be identified as flowing from it?

In other words, when we talk about programs like this, we should be talking under the same discipline that we try to apply to Corps of Engineers projects, the cost-benefit ratios is the phrase they use there, that that should apply to this thing, too; is that what you are telling us?

Mr. RICHER. I would say "Yes." I would say initially when you set up the original parameters for such a program that you should probably set them up to do what minimum you would require, and anything that you would get from such a program over that would be plus for you.

Mr. RAMP. I think it is a very fair question, Senator. This cost ratio, Mr. Richer gave the example of State control, in my example, I was talking of independent businessmen being regulated by Federal or State to a point which is possible as FAA does it where it is pretty scary, if I may use that phrase, from their standpoint to make a mistake. I think the cost ratio is tremendous.

What I think in my statement I was saying is we have a lot of trained men, we have some equipment, the ability to do this job at that level we think is easier and less costly than to take it on a full-blown national scale, as Mr. Richer said, from a manpower standpoint alone is very frightening due to the depletion of mechanics. This is a very frightening thing, because if periodic motor vehicle inspection is not done correctly, then it is of no value to anyone. If loose ball joints are allowed to hang on the front of an automobile after an inspection because someone forgot to look at them or because they were not part of a standard, they can create an accident on a highway as quickly as a blown tire at 60 miles per hour, for example.

Mr. HALFEENY. Senator, Mr. Richer tells me that the Mobil centers after a great expenditure of money have been generally abandoned, is that correct?

Mr. RICHER. Yes. They started out with five centers constructed over the years from 1963 to 1966, and at present I believe they are only operating three. A couple of those are not on a profitable basis. So the large full-blown diagnostic center as such has not been a practical economic venture for Mobil as well as some other companies that have closed theirs.

One thing, Senator, I would like to add here, after I prepared this and started thinking about it in a little more depth, I find there are a couple of things to consider. In the presently envisioned diagnostic center—this would be either the lane type or the bay type, the lane being where you drive straight through and the bay being where you drive in and back out—at present there is not any way available of making an accurate diagnosis on a short-time basis to effectively determine whether or not a frame has been damaged severely enough to cause a safety problem.

Let us just disregard that for a second and say we just check the other things that could be checked today. Probably the full rate you could get on a drive in-back out type of situation would be somewhere around three to four cars per hour. This would be a full check. As far as the lane type operation, there really is not too much difference in productivity with the exception you do have the capability to lengthen the lane which in turn increases the productivity. This requires more cost and more manpower.

Senator HART. This does not take care of the hundred million cars that one of you reminded us would be on the road.

Mr. RAMP. Yes, sir.

Senator HART. But to the extent that the new car can be required to have the design which enables one to make the diagnostic testing or will apply the instruments and get the readbacks, and I think our first thought should be how do we attempt to insure the cars that will be coming on the roads, putting aside the problem with the ones we have already here, the ones that come on the road are designed consciously to reduce to a minimum both the expense and the unreliability of whatever testing procedures and diagnoses we can get.

I know that is easier said than done. Two days ago we had testimony from the automotive tank center, the Army's transportation center, and they showed several what I would call true diagnostic machines, computerized, put the tape in, and a Pfc. could drive the car he could read the test. He did not have to have this expert training.

So there is this down the road someplace.

Mr. RAMP. Senator, let me make a comment if I may about that, sir. The equipment industry today has the technology, the ability and most importantly the desire to bring about any type of equipment to any sophistication that is necessary to do the job. Computerized readouts are today a reality. This is no dream. The pushbutton age, so to speak, is here as it applies to diagnostic to an extent. But, Senator, where we have the stumbling block, again I come back to the standards and the guidelines, where we really have the problem, if I may get it down to really a basic point, is without knowledge of where we are going and how we are going to get there, there is no one with the exception of maybe a few people that have R. & D. money to excess that are going to try and outguess what is going to be needed, and this is a very serious thing.

Senator HART. You are saying that until the public is advised what standards should be met by the vehicles, you do not know what equipment to find out whether it meets the standard?

Mr. RAMP. That is correct.

Senator HART. Once the standards are out your technology will permit you to develop the machines?

Mr. RAMP. Both Mr. Richer and I are building and supplying and installing diagnostic centers, both drive-through and bay type. For instance, let us say the Department of Transportation engineers would say that a road simulator, for instance, was necessary for the front end to discover loose ball joints. To my knowledge at this point in time there is none available, and yet the capability to bring about a so-called road simulator is not beyond any of us to do so almost within a matter of months. But a road simulator is going to be fairly expensive and the cost—the tool and die processing and engineering, et cetera, costs money, and that is a typical example of what I might say we stumble on when we look at the future.

Mr. RICHER. Senator, might I add something along the same lines as you were mentioning about the Army showing you their capability of diagnosing a tank or a vehicle.

Senator HART. They were wheel vehicles.

Mr. RICHER. Anything that moves I would take. I have seen some of the reports that have been published on their program, and I believe it covers any vehicle, doesn't it—tanks, guns, anything that moves?

The military, or let's for the present just define it as general Government, has the ability to say if I want to buy a vehicle, I want this vehicle in this box. The box is 5 feet deep and it has four wheels and it does this and it does that, and everyone that comes out at the end of the production line is the same. We have a distinct problem in the automotive aftermarket; we not only have many boxes, they all contain different components within the box. Some of the basic things exist. I am not saying they are totally different. But we do have this problem that it is a little bit more complex than what the Army might have at this particular point.

I think it is only fair that we get on the right wavelength and understand what we are trying to get across in that aspect.

Senator HART. I think you are getting across very well.

Mr. Sutcliffe.

Mr. SUTCLIFFE. Let me ask you a few questions to see if I understand your problems and perhaps we can reflect upon the legislation together.

You point out that we cannot make significant advances in technology for testing until we know what items the National Highway Traffic Safety Administration thinks will be required to be tested in their vehicle-in-use standards. I guess a corollary to that is you are also asking for standards—and these are performance standards—that there be some parameters set down similar to perhaps SAE standards for the kind of thread spacing for a spark plug in terms of the equipment that is being used for the testing.

In other words, you have to have some kind of a standardization to help put the vehicles in the kind of boxes that the Army is able to put their vehicles in in order to accomplish diagnosis; that is what you need to advance the state of the art and not go in the wrong direction from a cost point at this point in time; is that a fair statement?

Mr. RAMP. It is a fair statement, but do not limit us to what we are doing. We are going ahead with research and development. We are not stopping.

Mr. SUTCLIFFE. But it is difficult for you to do so?

Mr. RAMP. Right. When you look at the PMVI, again come back to my statement of the brake problem, the brake engineers, the brake friction material, those who make the friction material that goes on brakes and the engineers who build the automobiles, someone says the fade factor should be checked at certain miles per hour.

Now, if you would say to us as an industry this will be necessary at 40-miles-per-hour—now, within a 40 mile an hour capability it is possible that we could go various routes again thinking of the cost factor to check those brakes at 40, but it might be a different ballgame entirely if someone said, a group of engineers who know the brake business, say it is necessary to check them at 60.

Mr. SUTCLIFFE. Let me take that point, then, and suggest what answer we might get from the Department of Transportation. If we asked them: You were required to promulgate vehicle-in-use standards by January 1, 1969. Why have you not done it? We might get some kind of answer like this: No. 1, we are not exactly sure what items in the vehicle we need to test. Assuming that we do isolate and can isolate all the safety items of the vehicle, we do not know what the cost-benefit analysis to set that out as a vehicle-in-use study. In other words, they will use as their argument for not setting the standards the fact that they do not know because technology has not progressed and we have not seen in operation what is reasonable to demand of vehicle testing. So, in many respects we are on a treadmill, because you people are waiting for the standards and the standard setters are waiting for the technology.

This bill I think tries to start to break this impasse by setting forth a schedule of promulgation of those standards which are necessary and a judgment that technology will be available on a cost-effective basis to meet whatever standards are found to be necessary for the public health and safety.

But to say that is to also point out that that was also said in the National Highway Traffic and Motor Vehicle Safety Act of 1966. So, in saying it again we are going to try to encourage, I would imagine if this legislation passes, that that message be reinforced to the administrator and the standard-setters.

Do you feel that we now, through technologies that you people yourselves are developing and those which the administrator is bringing to bear upon this problem and the possible commercial fallout from them, that it would be safe to proceed with the standard setters setting forth those standards for vehicle-in-use components of the vehicle that obviously relate to safety and to then, once those standards are set, allow a certain amount of time by which you develop testing capability for those standards but allow the play of the free market to come up with cost-effective technologies to reach that goal reached by the standard setters? Would that be an intelligent way to proceed from this point on?

Mr. HALFPENNY. Before he answers that, I think the serious problem confronting the entire industry is the great suspicion apparently of Government to use or take advantage of the technical knowledge and the know-how of the industry.

Mr. SUTCLIFFE. Where is that suspicion, the National Highway Safety Administration?

Mr. HALFPENNY. I think it is generally that industry leaders are not called in and asked questions. It takes a long time for a person to become a mechanic. I would say a good mechanic has a longer training than we have in the legal profession to really become proficient in it, a minimum of 7 to 9 years. And everyone wants to discount this mechanic as being incompetent.

Good mechanics know more about the problems of the automobile, and we have some outstanding mechanics and engineers that have been working on these problems a lifetime, their judgment on some of these problems should be used.

Then, the equipment people can come along and have some method of testing. The industry's big problem is on periodic motor vehicle inspection of some of these critics, insurance companies included, that speak as though they want to do so much to reduce repair cost and promote safety are the ones who stir up people and fight these periodic motor vehicle inspections in the State legislatures.

We have been attempting to get PMVI in States for years and years, and we find the motor clubs and insurance companies contesting it.

The real serious problem is cars that are dangerous instruments on the streets. You will have mechanics tell you that people come in and talk about a brake lining and they take the wheel off and find there is no brake lining at all, and they say what will it cost, and when told the cost to do the job, they will say put the wheel on and they drive off with this unsafe car, it is really a dangerous instrument.

Mr. RICHER. I would like to add one thing. It might be construed if you go back and read what we were talking about before, about putting cars in boxes that we are advocating a system. That is not true.

Mr. SUTCLIFFE. But if you set performance standards, you can have a variety of different kinds of cars that are still compatible with the diagnostic system.

Mr. RICHER. Basically all cars have a certain basic number of items in the same car.

Mr. SUTCLIFFE. They use the same size thread depth for spark plugs.

Mr. RICHER. No.

Mr. SUTCLIFFE. Most all.

Mr. RICHER. Most all, OK. But they all have specific things which have to be checked. It is not fair to say it is impossible. It is just not fair to say that it can be done economically today because really nobody has said, of all the systems in an automobile what do you want to check? Do you want to check how high the acid is in the battery? Fine, we will check that. But just tell us you want it done.

One of the things I would like to convey to you right now is from an equipment manufacturing standpoint, we are more than willing to furnish you with anything you want to help you in any way to determine what things are wrong.

Mr. SUTCLIFFE. This is the task that Congress of necessity has delegated to the National Highway Safety Administration.

Mr. RICHER. I question whether enough industry has been called on in the right places to give you the guidance necessary. You may be a little tired of hearing the practical approach to this thing, but it all

boils down, gentlemen, when you get out in the field that guy that is claimed in some cases I have heard in the last few days is a crook, he is the man who is going to have to fix the automobile. That is the man that is ultimately going to be responsible to see that this work is done and the car is safe to be on the road. Maybe we should define and raise this gentleman's stature, and the certification program is one way to do that.

Senator HART. That runs into a little static, too.

Mr. RICHER. Certainly. I was told at one time if you tried to do something that is quite a bit different from what has been done in the past 20 years, and you know I am not that many years over 20 to be qualified, but if you want to do something that has been and is a radical change from what has been done in the last 20 years, you have to step on some people's toes to do it.

Senator HART. That statement will get you in more trouble than your statement about one type of car, but I agree with you.

Mr. HALFFENNY. We do offer any of the technical knowledge that is available as far as aftermarket is concerned to be of any help at any time.

Mr. SUTCLIFFE. Let me go to one question related to your example of frame deformation. I imagine there are degrees of frame deformation where a visual inspection of a rather serious crash is going to show frame deformation that is quite obvious. To the extent we have property loss reduction standards, bumper standards, that prevent damage to the exterior of the vehicle in most speed crashes, would we be minimizing to some extent because of the requirement to have beefed-up frames—to perhaps have beefed-up frames to meet that capability, minimizing the inspection problems resulting from minimum frame deformation that still presents safety hazard?

Mr. RICHER. You are asking a design question which I do not feel qualified to answer on. Maybe I can add one thing at you which might help. When I speak of frame repair and the inspection thereof after it is done, I am talking specifically about the automobile that has hit a head-on car, another car, or has run off the road and sheared off a pole where there has been serious damage done to the frame.

It is one thing to correct a frame and the next thing to do it right. You can pull it back into squareness as near as possible with many machines on the market today.

Mr. SUTCLIFFE. This is one of the reasons why the bill requires an inspection after an accident.

Mr. RICHER. That is my point. I don't believe in the present form, no matter how you cut what you have put in here, that you could have the capability to do that. Just as a comment, and I wouldn't want to comment any further than to say I think you will probably end up having two types of inspection for this type of problem.

In other words, you will have one for your PMVI inspections and you will have another for your crash programs, because this is more detailed.

Senator HART. So that the record will be clear, your technology, the area in which you two gentlemen operate, is capable of developing instruments and methods that would permit an after crash inspection to be made that would be reliable?

Mr. RICHER. We have them today, Senator, in all shapes and sizes.

Mr. RAMP. And some that are in the R. & D. stage that are better than the ones we have had before. So, the technology is growing. It is not going backwards or staying static. It is certainly more sophisticated.

Again striving to do better at a lower cost is a constant goal.

Senator HART. We appreciate very much the very specific and practical counsel that you have given us, and I am not discouraged by it either.

Mr. HALFPENNY. Thank you, Senator. I thought this was the type of information that seems to be lacking altogether in this problem. We have, I think, in the automotive industry some of the most capable people and dedicated people that are willing to give of their time and service if they are asked to do so.

Senator HART. I find it hard to conceive of the system—both safety and reparability; crash reduction cost—either system being administered wisely if there is any failure to consult at every stage of the development those who, as you put it, whether it is a mechanic or a tool operator who is designing diagnostic equipment—unless its administrator consults those elements of the automotive economy, the machine won't run, I agree with you.

I said your general testimony doesn't disturb me, but you do leave us this late Friday afternoon on an unhappy note, I think it was Mr. Richer who said a mechanic will sometimes take a wheel off and check the brake and find there isn't anything there and the owner will say put it back on, it costs too much to fix and off he goes—and it is a lethal weapon.

There are a lot of problems in this land that you can't even understand much less get an answer to, but, my God, in a society with 100 million of those potential weapons, it should be long past when a thing like that could be separable.

Mr. HALFPENNY. We sure appreciate your concern, because it is a concern of industry. Naturally, we have a selfish motive that we are in the business, but we want to be helpful.

Senator HART. It is insanity to know that there are a number of those vehicles moving in traffic right now, not to discount the drug traffic as a danger.

But you are much more apt to get hit by a car than pick up a habit.

Mr. RAMP. I am sure the administrator has very capable engineers on his staff and all this, but as Mr. Halfpenny says, if there are any contributions we are capable of making, we want to stand ready to help him in any way we can.

Senator HART. We appreciate that, and when the administrator testifies we will advise him.

Mr. HALFPENNY. Senator, it was too late to request them to be personally present, but I have a statement from the Independent Garage Owners of America, that Mr. Flanagan, who has appeared before, would make and I wonder if I could have that inserted in the record.

Senator HART. Yes, it will be printed.

(The statement follows:)

STATEMENT OF THE INDEPENDENT GARAGE OWNERS OF AMERICA, INC.

My name is James Flanigan of the law firm of Halpenny, Hahn & Roche, Chicago, Illinois, General Counsel for the Independent Garage Owners of America, Inc.

The Independent Garage Owners of America is a National Trade Association of approximately 4,000 members who are independent garage owners; they are located in 35 states. Our membership covers all phases of automotive service: general repairs, body repairs and specialty repairs. We are a part of the second largest industry in this country and we take pride in the vital role we play in serving the public.

There are now approximately 112,000 independent repair shops across the nation. The Bureau of Census figures for 1963 showed 139,000 of these shops, so that there has been a significant decrease in their number. The 1963 figures showed 137,000 units were unincorporated businesses run by an active proprietor; I do not have the more recent figures, but it is still true that a very large percentage are today so operated and managed. In other words, this is an industry of small businesses, in which the owners are active workers as well as managers.

In this connection, the yearly sales volume averages, as shown by a Hunter Micromarket Survey, are significant. As they're printed, the volumes are:

| Dollar volume: | Percent repair shops |
|--------------------|----------------------|
| 300,000 and over | 1.3 |
| 200,000 to 299,999 | 1.9 |
| 150,000 to 199,000 | 3.3 |
| 100,000 to 149,999 | 8.2 |
| 80,000 to 99,999 | 5.2 |
| 60,000 to 79,999 | 10.0 |
| 40,000 to 59,999 | 16.0 |
| 20,000 to 39,999 | 28.5 |
| Up to 20,000 | 25.6 |

As you can see, we are not talking about big business.

We note with special interest that S. 976 provides that vehicle inspection stations cannot be associated with any business engaged in the repair or sale of motor vehicles or motor vehicle parts except in areas where the vehicle population is insufficient to make independent motor vehicle inspectors feasible. Before the adoption of such proposal, Congress should consider information that is now available, comparing private inspection stations versus state inspection station programs.

In June 1968, the Department of Transportation released a report, "An Investigation of Used Car Safety." This report was prepared by Operations Research, Incorporated, Silver Spring, Maryland, under contract No. FH-11-6522. If inspection stations cannot engage in motor vehicle repair, a rejection requires three separate visits by the car owner. First, the vehicle must be taken to the inspection station where a defect is identified and a rejection sticker issued; second, to an automotive repair facility for the correction of the defect; and third, back to the inspection station for re-inspection where the approved sticker is then attached.

Operations Research, Incorporated computed that the motorist had to pay twice as much in time and money for the inspection through a state-owned system than for the state-appointed system, even though the inspection fee for the state-appointed system was less than for the state-owned system.

Operations Research found that the average distance traveled round trip for inspection and re-inspection was 25 miles for the state-operated system compared to 4 miles for the licensed system.

The repair costs per vehicle inspected with a state-owned system, which averaged 85 cents per vehicle and for a state-appointed system, \$1.46 per vehicle. The travel time to the motorist based on only \$1.25 per hour for his time was \$3.88 in the state-owned system and \$1.04 in the state-appointed system. Further, in the state-owned system the taxpayer paid \$1.05 through taxes whereas in a state-appointed system there was a revenue of 4 cents per vehicle inspected which the state received from inspection fees. Interestingly, the vehicle condemnation losses were identical in the state-owned and state-appointed systems.

If the Congress makes a decision to completely divorce licensed inspection stations from automotive repair facilities, they should do so knowing that it is the motorist who is going to carry the greatest burden and not the automotive repair facility.

We have given consideration to the possibility of recommending that Congress permit automotive repair facilities to engage in inspection but requiring defects identified by the inspection stations to be repaired at another service station. This, of course, would mean that no garage would ever make a profit as a result of identifying a defect during motor vehicle inspection. However, we believe that if such were the case, the more inspections a repair facility conducted, the less repair work it would receive.

Inasmuch as a garage would make more out of repairs than it makes from inspections, the ban on repairing an identified defect would discourage garages from becoming licensed inspection stations.

Much has been stated about profits from repair work generated by the inspection station located in a repair facility. Operations Research provided the Department of Transportation its findings on this aspect. The accompanying table titled, "Summary of Service Station MVI Profits Per Inspection, By Inspection, Repair and General Sales, for Three MVI Systems" indicates the licensed inspection stations made a profit of nine cents per vehicle inspection, and averaged a profit of 19¢ on sales and repair service. This compares to a net profit per inspection of 11¢ in states with state-operated inspection stations.

Here then is a difference of 17¢ as far as the automotive service industry is concerned. Compare this to an economic burden to the motorist, which indicates that on the average he pays almost twice as much for inspection that is not associated with a repair facility. It should be noted that the most frequently found violation is the proper focusing of headlights, a very minor adjustment usually. Yet the motorist would be required to make three trips to obtain a completed inspection if Congress determines that a repair facility cannot be licensed for inspections. Irrespective of whether repair facilities are permitted or not permitted to perform inspections, the industry will still perform the repairs. It is the motorist who will bear the burden. We believe this comparison between state operated and privately operated inspection stations speaks most graphically in response to the claims of wholesale rejections to force unneeded repairs on car owners.

We, therefore, suggest that before any legislation is recommended, that consideration be given to the views expressed above.

**SUMMARY OF SERVICE STATION MVI PROFITS PER INSPECTION, BY INSPECTION, REPAIR, AND GENERAL SALES
FOR 3 MVI SYSTEMS**

| Activity and account | MVI system cost, dollars | | |
|------------------------------------|--------------------------|-----------------|------------|
| | State-operated | State-appointed | Spot check |
| Inspection: | | | |
| Receipts..... | | 1.54 | |
| Expenses: | | | |
| Labor..... | | 1.12 | |
| State stickers..... | | .12 | |
| State license..... | | .01 | |
| Depreciation on equipment..... | | .09 | |
| Performance bonds..... | | 0 | |
| Overhead..... | | .11 | |

| Net profit per inspection..... | .11 | .28 | .11 |

Senator HART. We are adjourned.

(Whereupon at 5:05 p.m., the hearing was adjourned, subject to the call of the Chair.)

and the \mathcal{H}_2 norm of the system is given by

$$\|G\|_2 = \sqrt{\lambda_{\max}(P)},$$

where P is the unique positive definite solution of the Lyapunov equation

$$A^T P + P A + C^T C = 0.$$

It is well known that the \mathcal{H}_2 norm of a system is a measure of the average power of the system's response to a white noise input. The \mathcal{H}_2 norm is also a measure of the system's energy. The \mathcal{H}_2 norm is a useful tool for the analysis and design of control systems. In this paper, we will use the \mathcal{H}_2 norm to analyze the performance of the proposed control system.

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

FRIDAY, MAY 28, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to notice, at 10 a.m. in room 5110, New Senate Office Building, Hon. Vance Hartke presiding.

Present: Senators Hartke, Cotton, and Griffin.

Senator HARTKE. Good morning to everyone.

Today the Senate Commerce Committee begins its 11th day of hearings on auto insurance reform proposals directed at the compensation delivery system and the automobile which so profoundly affects that system. In previous hearings we have been told how the lethally designed eggshell exteriors of automobiles cost this country billions of dollars and aggravate the human misery associated with auto accidents.

This morning the committee will receive the testimony of Douglas W. Toms, Acting Administrator of the National Highway Traffic Safety Administration. Mr. Toms is charged with the responsibility of protecting the lives of our Nation's drivers—no easy task in light of the magnitude of the problem, the foot dragging of the automobile industry, and the pussyfooting of certain overseers of policy in the White House.

Because of his responsibilities Mr. Toms is uniquely qualified to present the Administration's position on S. 976, the Motor Vehicle Information and Cost Savings Act. He is also the person to answer questions raised in these hearings concerning the bumper standard of the Nixon administration which, according to some witnesses, does not qualify as either a safety standard or an insurance cost reduction standard.

Mr. Toms, we welcome your testimony this morning. You may proceed as you see fit.

**STATEMENT OF DOUGLAS W. TOMS, ACTING ADMINISTRATOR,
NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION, DE-
PARTMENT OF TRANSPORTATION; ACCOMPANIED BY JACK L.
GOLDBERG, ASSOCIATE ADMINISTRATOR FOR PLANNING AND
PROGRAMING; JOHN A. EDWARDS, ASSOCIATE ADMINISTRATOR
FOR RESEARCH AND DEVELOPMENT; AND LAWRENCE SCHNEI-
DER, ACTING CHIEF COUNSEL**

Mr. Toms. Thank you.

Mr. Chairman, Senator Cotton, ladies and gentlemen: I welcome this opportunity to present the Department's views concerning Senate

Bill S. 976—a bill to amend the National Traffic and Motor Vehicle Safety Act of 1966. This act provides the basic legislative authority for our motor vehicle safety regulations. Our concern and responsibility for motor vehicle safety has prompted intense interest in the Department toward the proposed amendment.

As you know, some time ago we officially set a minimum departmental goal of reducing the annual rate of traffic fatalities per 100 million vehicle-miles to 3.6 deaths by 1980. This change would represent a one-third reduction in the 1968 fatality rate.

However, as a result of increasing numbers of licensed drivers and registered vehicles, the vehicle mileage will increase approximately one-third by 1980 and substantially offset the reduction in the death rate. Thus, there would still be 50,000 highway deaths in 1980.

Therefore, the Secretary and I have agreed to set our sights even higher than the minimum goal. We hope to reduce the fatality rate by even more than one-third so that the number of highway deaths in 1980 will be only about half of the current 55,000 annual deaths.

I am happy to report that in 1970 we appear to have begun to reverse the upward trend in the number of annual fatalities on our highways. There were approximately 1,100 fewer traffic deaths in 1970 compared to 1969—about a 2-percent reduction. This represents the lowest fatality rate per miles driven in our history.

I can further report that based on early estimates for the first quarter of 1971 we are running 3 percent lower in fatalities than for the first quarter of last year, despite a poor month in January of this year.

Mr. Chairman, these are hopeful signs, but this is only the beginning. A toll of 50,000 dead on the highways each year is a toll that brings disgrace to civilized society, especially when the technology for solution is either in hand or just over the horizon.

At the beginning of my tenure I established three major safety priorities: Crash survivability, the experimental safety vehicle, and alcohol countermeasures.

We have issued the passive restraint standard and have demonstrated design solutions for protecting people in 60-mile-per-hour crashes.

Our experimental safety vehicle program will provide us by this December with prototype automobiles which will protect occupants at 50 miles per hour.

Our alcohol countermeasures program, funded under the Highway Safety Act, will shortly begin to prove that a broadbased program to control drunk driving will save thousands of lives.

Nothing—but nothing—must be allowed to deter us from our goals.

But, indeed, we recognize another need. The frustration resulting from millions of our people experiencing minor crashes involving substantial property damage and the problems which follow cumulate into a national problem which cannot be ignored.

We, therefore, share with you, Mr. Chairman, and other cosponsors of S. 976, the view that the objectives of providing assistance to the consumer on the damageability and repair of automobiles is a necessary added mission for this Department.

However, in doing so, we must not eclipse our principal safety objective of reducing fatalities, injuries, and accidents. We cannot—and must not—dilute our efforts in this crucial area, particularly since recruiting skilled and experienced staff for our priority safety mission has proven to be very difficult.

Further, as this committee is well aware, there are provisions in the 1966 Act that have not yet been fully met.

Therefore, after extensive consideration of the proposed amendment and its implications, we favor an alternative approach to what we consider to be the most desirable objective of the bill—better consumer information.

We are unable to support S. 976 principally because we do not believe that the establishment of Federal standards for automobiles, purely for economic reasons, is in the public interest.

We feel that the competitive nature of the marketplace is less restrictive and more responsive to the whims and fancy of the purchaser. We are not certain that the Government should be making restrictions in those areas where the consumer most enjoys expressing individuality and personal taste. He should be able to spend his money as he sees fit unhampered by Government control.

However, we do believe in an aggressive governmental policy of regulation in matters of health and safety. We think recent actions in both safety and emission control demonstrate this belief.

In the aspect of economics of consumer products we believe that the consumer should have complete freedom of choice. Consumer choice, however, can be most effectively exercised with maximum possible consumer information. Our intention will be to provide this information in the most objective manner possible.

Aside from our general opposition, we have several specific problems with Government-imposed property loss reduction standards:

1. These standards would involve us heavily in design features, including styling, rather than the performance standards that we now issue to insure safety.

2. Specific applications of present technology are almost nonexistent in this area as compared to the situation that existed in safety in 1966. The 1966 act was preceded by 20 years of activity by the Society for Automotive Engineers, General Services Administration, and other organizations.

The Department has other problems with this bill:

1. We cannot, at this time, advocate or support the establishment of a nationwide independent diagnostic inspection system. We feel that the state of the art necessary to justify such a system is several years away.

2. We believe that several items in the bill are best handled by administrative action instead of specific legislative mandate; for example, amending the highway safety standards No. 1 and No. 2.

3. We estimate that the annual cost of the nationwide independent diagnostic inspection system required by the bill is extremely high. For example, the construction plus operating costs of the diagnostic centers would be in the range of \$1 billion per year. Since we do not have adequate information as to the cause-and-effect relationship between vehicle defects and crashes, we should not embark on such a costly venture at this time.

Again, we want to emphasize our reluctance to compromise our principal safety mission of reducing fatalities and injuries in order to lessen the monetary costs of minor accidents. Money will never buy back a single lost life.

We will discuss with you today our proposed alternative concept. We will submit a bill to you in the near future.

A summary of the Department's proposal:

The Department's proposal will have as its objective a program of consumer information on vehicle susceptibility to property damage, crash worthiness, and aggressiveness aimed at—

1. Providing the consumer with the basis for a more informed choice in the marketplace.
2. Influencing the establishment of lower insurance premium rates for owners of vehicles which provide for greater occupant safety and protection against crash damage.
3. Establishing incentives in the marketplace for auto manufacturers to build cars with reduced damage characteristics and increased safety protection.

I must emphasize that consumer information developed scientifically and objectively is obviously a complex program and will require development of a solid research base to determine feasibility, cost, and public policy implications.

Before examining our proposals in detail, let me discuss some of our work already underway which will provide collateral benefits relating to vehicle crash damage protection.

Mr. Chairman, if you would permit, we would like at this time to show a film. I will attempt to narrate some of the key features of the film. I apologize for the location of the screen and the difficulty of some of the members to be able to view the picture.

Senator HARTKE. Let me say that we cannot complain of partisan considerations in view of the fact that only the Republicans are being denied the right to see the film.

I might say, in view of the Vice President's statements lately, maybe it is better that they do not see it.

(Presentation of film with narration.)

Mr. Toms. Mr. Chairman, that is a 1968 Ford going into the pole at approximately 60 miles per hour. This is an overhead shot showing the movement of the engine and showing the amount of energy that is being transmitted to this vehicle, and you will note that the pole comes all the way to the roofline and the windshield separates.

That is a 1961 Chevrolet with a different type of frame going into the pole at 56 miles per hour. The differences in these two vehicles is in the frame and structure. Note that in this one the pole goes all the way into the passenger compartment, the roof separates from the body of the vehicle, and there is absolutely no crash survivability whatsoever.

This is the same make car that has an energy management structure. We have put plastic hinges in the frame and demonstrated that we can take that same vehicle into the pole at 63 miles per hour and provide complete survivability for the occupants because the body separates from the frame and the frame manages the energy.

This is a slow-motion shot showing that vehicle going into the pole. There is an anthropometric dummy in the vehicle. The bag goes off. There is no intrusion of the pole into the passenger compartment and there is ample space to save any life in that vehicle.

This is an indication that we can manage that energy.

This is a picture of a 5-mile-per-hour bumper into the pole, and it is

very hard to see, but you will note that this is a slow-motion shot showing the bumper that has been sufficiently beefed up to hit the pole with no damage.

We have been running many different kinds of bumpers and structures and energy management devices in an attempt to best reduce the gravity forces that are transmitted into the occupant compartment.

This is an overhead shot of the same scene.

I may add that in our experimental safety vehicle program we have been working on a number of different energy management devices of this type so that we can better understand how these forces work in terms of saving lives.

There is another shot which is very hard to see because there is too much light in the room. Mr. Chairman, this shot shows 10-mile-per-hour crash into the pole, and the type of structure and devices necessary to properly manage that energy in such a collision.

Here is the 10-mile-an-hour shot of a vehicle with stiff-ridged bumper. What we were doing here is getting acceleration readings, attempting to find out exactly what happens to the structure of the vehicles with these kinds of impacts and the amount of deformation.

There is an overhead shot. You can see some of the wires and instrumentations that we have on the vehicle, and you can see the kind of energy that is transmitted to the frame, engine, and structure of the vehicle.

The same shot from underneath indicating exactly what is taking place in that kind of crash.

Next we will show you some cars crashing with closure speeds in excess of 90 miles per hour. These are two identical vehicles, closure speed of 90 miles per hour, going into each other, and you will notice that the energy really begins to be managed when the two wheels hit and the engines meet. You will note that there is a slight difference in these vehicles, in the sheer dynamics of the crash. One climbs up slightly over the other one. You can see how very subtle differences in the shapes of these vehicles makes quite a difference in how they crash.

Next we are going to show you a modified white car and the red car at the same speed, and you will note that the modified car is a good deal more aggressive and suffers much less damage than the unmodified red car. These were some experiments that we conducted in an attempt to learn more about this vehicle characteristic.

This is the shock structure for the experimental vehicle. Its purpose is to aid in determining how we can manage energy at fairly significant speeds, and how much space and distance we need, and how it is transmitted.

You will note that the wheels actually lift from the surface, but we can compress the device in that short distance and absorb that energy.

Senator HARTKE. What is the speed of impact on that?

Mr. Toms. I do not happen to have the exact speed of that. About 50 miles per hour I am told, Mr. Chairman.

This is some of our lateral testing to determine frame strength and affected structure in the lateral crash. You will notice that the pole is entering the car rather significantly, so much so that survivability for the right front occupant would be a serious consideration.

This is a 20-mile-per-hour lateral crash. Here is an underneath shot

so that you can see how the frame flexes and how that energy is transmitted across to the center of the vehicle. It also shows the exact amount of intrusion of the pole into the structure.

Is this the modified one, Bill?

Now, we have modified the frame by moving up crossmembers underneath the vehicle to indicate that the intrusion is much less here, approximately a half to a third as in the previous vehicle. This provides the space that is necessary for the safety of the occupants.

We will now show you an underneath shot that shows the extra strengthening of the frame and the cross members, and how most of the energy is absorbed by that outer rail. You can see that there is much less deflection in the remainder of the car. What we are doing here is using the entire undercarriage to help absorb that energy.

Now, this is a car-to-car side crash baselined at 40 to 45 miles per hour, and it shows a vehicle going into the side of another vehicle. You will notice that in this lateral crash, the struck car is being deflected and pushed aside by the striking car.

Now we are going to show you a car-to-car side crash that is modified, and if the film were better—we cannot see it—just go right on through.

If the film were better, you would be able to notice that there were really significant reductions in penetration. Clearly, the aggressiveness or the hostility of the nose of the vehicle is very critical to the safety of occupants in these automobiles.

It is important that we do have strong enough side members in vehicles so that we can prevent the intrusion of these cars in lateral crashes.

These were 40 to 45 miles per hour.

Note this one has been modified and that there is literally no intrusion into the passenger compartment of the struck vehicle by the striking vehicle. In fact, the inner wall in this crash was deformed only $3\frac{1}{2}$ inches.

Mr. Toms. Let me now describe for the committee the various provisions of the Department's proposal, a consumer information program.

The Department will request authority for the following consumer information program:

1. To develop and publish information on major makes and models of automobiles regarding their susceptibility to property damage, crashworthiness, and aggressiveness, if, and to the extent, our research shows it to be feasible and in the public interest. Research and test authority to determine property loss susceptibility will also be sought.

2. To require insurance companies to provide the Department, for use in this program, accident claims and cost data under procedures developed by the Department.

3. To require insurance companies to publish premium rate data by make and model of vehicles under procedures established by the Department.

4. To require annual reports from each car manufacturer on actions taken to improve safety and property loss reduction, and make these reports available to the public.

VEHICLE INFORMATION

Providing vehicle information by make and model for safety performance, damageability, and cost of repair, would be a major new activity for the Federal Government. Product ratings for benefit of health and safety are made by other agencies. Our policy has generally been to set safety standards for all vehicles so that the consumer knows he is buying a vehicle with a certain level of safety.

Our only efforts, so far, to differentiate vehicles in terms of performance, has been the issuance of several consumer information regulations concerning stopping distance, passing ability, and tire reserve load. We have also funded statistical studies on fatalities and serious injuries in motor vehicle crashes by make and model.

Low-speed damage susceptibility comparisons represent a more difficult consideration from a technical standpoint.

The purpose of vehicle information is to tell the consumer what can be expected to happen to his vehicle in actual motor vehicle crashes, and to provide this information to insurance companies. This cannot be achieved by striking autos against barriers or by requiring manufacturers to conduct thousands upon thousands of crash tests.

A research program must determine the feasibility and costs of developing more scientific and objective comparisons. This same program must develop much more sophisticated techniques for accomplishing that objective.

RESEARCH AND TEST PROGRAM

The Department will request authority to perform a research and test program for new vehicles to determine safety performance information by make and model and also for vehicle damageability and cost of repair. This research and test program will be directed at the objective of reducing the cost of repair without jeopardizing the overall safety performance.

Research, analysis, and testing are required to determine the precise relationship among a car's:

- (1) fragility, or its susceptibility to damage;
- (2) crashworthiness, its protection of passengers from personal injury or fatality; and
- (3) aggressiveness, for example, its potential for causing abnormal damage to the struck vehicle.

This relationship must be understood in great detail.

It must be emphasized that crash testing of all makes and models of cars would be prohibitively expensive. Some crash testing will be necessary, but this must be augmented by analysis, simulation, and accident data to obtain the necessary research information.

We believe that these research efforts will provide the Department with sufficient information to permit a strong consumer information package. This type of information can steadily increase the public awareness of the possible variations in vehicle injury protection and damage susceptibility. Thus, the consumer will be provided the opportunity to make a better choice about one of his more expensive purchases.

INSURANCE INDUSTRY CLAIMS DATA

In parallel with the research, analysis, and testing activity to determine the vehicle damage susceptibility, crashworthiness and aggressiveness, we need and will seek authority to acquire insurance industry accident claims data on a regular basis. These data will be a necessary part of our research program. We believe that these types of insurance data can be easily acquired. We should be able to determine from these data the three factors for vehicle comparison previously discussed.

The insurance data will provide the vital link between crash tests (car-to-car and barrier tests), computer simulations and actual motor vehicle crashes. Without this link, the resultant vehicle information could be incorrect or misleading to the consumer. But it should be emphasized that the insurance data must be integrated with research, systems analysis, and testing to provide the complete vehicle information picture.

INSURANCE PREMIUM RATES

We believe that consumer information on vehicles should, in fact, result in a differential in insurance premium rates for cars. This rate differential should benefit purchasers who buy cars with increased safety and damage protection. Thus, one of the major cost benefits associated with lower economic loss—and better crashworthiness—should be reduced insurance premium rates.

Mr. Chairman, it is a real pleasure for me to read this morning the Wall Street Journal and indicate that we expect auto insurance rates to fall, and if I may quote an official of one of the Nation's auto insuring giants, he said, "Frankly, since the middle of last year, we have been turning up unconscionable profits in auto coverage." This company says it is considering filing in stages for rate reductions.

Insurance rates must begin to take into consideration the differentials in costs of repair.

The publication of insurance rates by make and model will tell the consumer whether or not insurance companies are taking vehicle characteristics into consideration in setting premium rates.

MOTOR VEHICLE INSPECTION AND DIAGNOSTICS

I want to use this opportunity to reiterate my position regarding motor vehicle safety inspection. I do not, at this time, support periodic motor vehicle inspection (PMVI) as the only type of inspection system for our States. However, I do strongly support the objective of removing unsafe motor vehicles from the road. There are important differences between these two concepts.

The major problem with periodic motor vehicle inspection is that we do not yet know how to design an inspection system that will assure identification of unsafe vehicles quickly, accurately, and inexpensively. Consequently, we are redrafting our highway safety program standard on motor vehicle inspection. This does not mean, and must not be interpreted, as saying we are doing away with ~~unsafe~~ vehicle surveillance. It does mean that we are giving States a certain amount of flexibility in how they accomplish the job of removing unsafe vehicles from the road. We will evaluate the results and we will

strongly oppose the efforts of any State to abandon this area of concern.

We believe also that the consumer needs assistance in determining what repairs his vehicle needs and whether those repairs are performed properly. Without doubt, inspection can assist the consumer in these decisions.

I also believe that automated diagnostics will be the technique of the future. But, we are not, at this time, prepared to support legislation which levies upon the States a system of independent diagnostic inspection systems.

Too much is unknown. What is known is by no means positive. In the United States today, based on available data, there is no statistical difference in fatality rates between States that have periodic motor vehicle inspection and those that do not. This is not an indictment of motor vehicle inspection. It may be an indictment of inspection as practiced today. We do not have adequate information as to the cause and effect relationships between vehicle defects and crashes, although some studies in Europe indicate a far closer link than we have determined thus far.

Additional analysis and research are required before we could recommend a national system of independent diagnostic centers for motor vehicle inspections. Some research has been underway for several years. But considerably more effort is required to determine, for example, safety-critical components, tolerance limits for performance, inspection procedures, and equipment. Much more trade-off analysis is also required to determine the most cost-effective approach for both safety and economic loss protection.

USED VEHICLE RESEARCH PROGRAM

The used vehicle research program which the Department has been conducting for several years is designed to:

- (1) determine the type and number of vehicle defects which exist on the road today,
- (2) determine the effect of defects on vehicle performance,
- (3) determine the relationships between vehicle defects and crashes,
- (4) verify that safety critical defects can be detected through vehicle inspection,
- (5) establish a complete list of inspection items and acceptance criteria,
- (6) develop effective inspection procedures, equipment, and skills, and,
- (7) develop an inspection system which can be used by States as a model in a series of demonstration programs.

I believe that through this systematic and logical process, we can achieve our objective while maximizing safety and the economic payoff.

Senator Corron. Mr. Chairman, would the witness permit me to interrupt him for a moment?

I am impressed by the statement you made a moment ago, that you did not find any difference between the death rate in States that have a thorough inspection system and those that do not have such a system.

Did I understand you correctly?

Mr. Toms. Yes, you did, sir.

Senator COTTON. Now, first, let me read to you from your own Highway Safety Program Standards, June 1969, on the question of periodic motor vehicle inspection, this is what your Department said:

Until recently, there was very little evidence to support the reasonable supposition that state inspection systems contribute to highway safety. This deficiency has now been overcome at least in part. Recent research demonstrates significant differences in state motor vehicle accident death rates associated with inspection programs.

In other words, your Department in June of 1969 had discovered that there was a difference and so proclaimed.

Now, you say that there isn't any.

Mr. Toms. Well, I came to the National Highway Traffic Safety Administration, since that statement has been made. Our people have reviewed much of this research and much of this information, and we have to confess to you that there is just no statistical difference in these States.

Now, when the motor vehicle standard was first written, No. 1, obviously the professionals that were involved were convinced that this would be of great merit. I feel that as they went along and pursued this program, they did find some encouraging signs. However, as you know, Senator, time marches on and we must continually review this information.

We have reviewed it. We have just completed a rather thorough analysis of this, and we regret to say that there just isn't any real statistical difference between the States.

Senator COTTON. Is there any real State inspection?

Mr. Toms. We think that periodic motor vehicle inspection can be done much better, and we think that diagnostics, as have been discussed before this committee—

Senator COTTON. I won't interrupt the hearing, but I would like to discuss this point further.

Senator HARTKE. Isn't it true that really until you develop some vehicle-in-use standards it is probably going to be impossible to make that determination?

Mr. Toms. That is a contributing factor, and we are very close now, Mr. Chairman, to be able to come out with those factors on vehicles in use that are definitely safety-related. It is our hope that, based on the Washington, D.C., study, we will be in a position to do that hopefully toward the middle or near the end of this year. We are also gearing upon our vehicles-in-use standards to complement this study that is nearing completion.

I might add that we are quite pleased with the quality of this study. I think it is going to provide us with some very useful information.

Senator HARTKE. Yes, but we have been asking for this for quite a number of years, you know. In fact, I have been working for safety for vehicles on the road since 1966. I don't meet this issue with a great deal of pleasure in view of my own personal tragedy in my own family. But since 1966 you have had the authority to promulgate vehicle-in-use standards, and you were directed to have those completed by 1968, and if I am not mistaken, this is 1971. Time is marching on.

Mr. Toms. Since I have been aboard, Mr. Chairman, we have been

working as hard as we can according to what we think our priorities ought to be. We admit that the high payoffs have not been realized in this program as in crash survivability and alcohol countermeasures. However, I can assure you we have been hard at work and it is my hope that we will be able to deliver these to you in the future.

Senator HARTKE. Why can't you do what is required by the law?

Mr. TOMS. I can't answer for my predecessors.

Senator HARTKE. Why can't you do it now? You said the priorities you established placed vehicle-in-use standards on the back burner, and maybe the burners are turned off.

Mr. TOMS. No; the burners aren't turned off, but repeatedly before this committee and other committees, we have been implored to set priorities. Consequently, we have set priorities and we have attempted to identify the priorities that we think would have the best payoff. We don't think that motor vehicle inspection is among those with a real high payoff.

Senator HARTKE. How many people are involved in that program now?

Mr. TOMS. John, can you answer how many people you have in Lynn Bradford's program relating to Tony Jacklin's program?

Mr. EDWARDS. Yes sir; in motor vehicle program service—

Senator HARTKE. In what now?

Mr. EDWARDS. The motor vehicle program service; we call it MVP, Mr. Chairman. We have 12 people working the problems of used vehicle standards. In the research activity, we have about four people actively running research projects in the area.

Senator HARTKE. Four people are involved, right.

Mr. EDWARDS. That is correct.

Senator HARTKE. How many are involved in vehicle-in-use, in the development of vehicle-in-use standards?

Mr. EDWARDS. Twelve, sir.

Senator HARTKE. In the total program to develop a vehicle-in-use standards?

Mr. EDWARDS. Yes.

Mr. TOMS. That is one of our operating divisions in our motor vehicle program.

Senator COTTON. May I make one observation, Mr. Chairman?

Senator HARTKE. Go right ahead.

Senator COTTON. I just want to call to your attention—and I do this with a good deal of pride—that in my own small State we have an inspection system. It has been rigidly enforced for some years. It doesn't cost to the State; it doesn't cost the Federal Government. I know that this bill will make it impossible for a garage, filling station, or anyone engaged in business to do the inspecting, but we do license such businesses, and they make a nominal charge for the inspection.

If they are caught off base in their inspection, they lose their right to inspect. It costs them in business calls since it is immediately known throughout the community that they have lost their right to inspect.

Now, the law is enforced so rigidly that if a car is caught on the road without the latest inspection sticker, it is taken right off the road. The people in that car have to find some other way to get home. They have to have the car towed in and inspected. There is no fair or favor exercise.

Did I understand you correctly?

Mr. Toms. Yes, you did, sir.

Senator COTTON. Now, first, let me read to you from your own Highway Safety Program Standards, June 1969, on the question of periodic motor vehicle inspection, this is what your Department said:

Until recently, there was very little evidence to support the reasonable supposition that state inspection systems contribute to highway safety. This deficiency has now been overcome at least in part. Recent research demonstrates significant differences in state motor vehicle accident death rates associated with inspection programs.

In other words, your Department in June of 1969 had discovered that there was a difference and so proclaimed.

Now, you say that there isn't any.

Mr. Toms. Well, I came to the National Highway Traffic Safety Administration, since that statement has been made. Our people have reviewed much of this research and much of this information, and we have to confess to you that there is just no statistical difference in these States.

Now, when the motor vehicle standard was first written, No. 1, obviously the professionals that were involved were convinced that this would be of great merit. I feel that as they went along and pursued this program, they did find some encouraging signs. However, as you know, Senator, time marches on and we must continually review this information.

We have reviewed it. We have just completed a rather thorough analysis of this, and we regret to say that there just isn't any real statistical difference between the States.

Senator COTTON. Is there any real State inspection?

Mr. Toms. We think that periodic motor vehicle inspection can be done much better, and we think that diagnostics, as have been discussed before this committee—

Senator COTTON. I won't interrupt the hearing, but I would like to discuss this point further.

Senator HARTKE. Isn't it true that really until you develop some vehicle-in-use standards it is probably going to be impossible to make that determination?

Mr. Toms. That is a contributing factor, and we are very close now, Mr. Chairman, to be able to come out with those factors on vehicles in use that are definitely safety-related. It is our hope that, based on the Washington, D.C., study, we will be in a position to do that hopefully toward the middle or near the end of this year. We are also gearing upon our vehicles-in-use standards to complement this study that is nearing completion.

I might add that we are quite pleased with the quality of this study. I think it is going to provide us with some very useful information.

Senator HARTKE. Yes, but we have been asking for this for quite a number of years, you know. In fact, I have been working for safety for vehicles on the road since 1966. I don't meet this issue with a great deal of pleasure in view of my own personal tragedy in my own family. But since 1966 you have had the authority to promulgate vehicle-in-use standards, and you were directed to have those completed by 1968, and if I am not mistaken, this is 1971. Time is marching on.

Mr. Toms. Since I have been aboard, Mr. Chairman, we have been

working as hard as we can according to what we think our priorities ought to be. We admit that the high payoffs have not been realized in this program as in crash survivability and alcohol countermeasures. However, I can assure you we have been hard at work and it is my hope that we will be able to deliver these to you in the future.

Senator HARTKE. Why can't you do what is required by the law?

Mr. TOMS. I can't answer for my predecessors.

Senator HARTKE. Why can't you do it now? You said the priorities you established placed vehicle-in-use standards on the back burner, and maybe the burners are turned off.

Mr. TOMS. No; the burners aren't turned off, but repeatedly before this committee and other committees, we have been implored to set priorities. Consequently, we have set priorities and we have attempted to identify the priorities that we think would have the best payoff. We don't think that motor vehicle inspection is among those with a real high payoff.

Senator HARTKE. How many people are involved in that program now?

Mr. TOMS. John, can you answer how many people you have in Lynn Bradford's program relating to Tony Jacklin's program?

Mr. EDWARDS. Yes sir; in motor vehicle program service—

Senator HARTKE. In what now?

Mr. EDWARDS. The motor vehicle program service; we call it MVP, Mr. Chairman. We have 12 people working the problems of used vehicle standards. In the research activity, we have about four people actively running research projects in the area.

Senator HARTKE. Four people are involved, right.

Mr. EDWARDS. That is correct.

Senator HARTKE. How many are involved in vehicle-in-use, in the development of vehicle-in-use standards?

Mr. EDWARDS. Twelve, sir.

Senator HARTKE. In the total program to develop a vehicle-in-use standards?

Mr. EDWARDS. Yes.

Mr. TOMS. That is one of our operating divisions in our motor vehicle program.

Senator COTTON. May I make one observation, Mr. Chairman?

Senator HARTKE. Go right ahead.

Senator COTTON. I just want to call to your attention—and I do this with a good deal of pride—that in my own small State we have an inspection system. It has been rigidly enforced for some years. It doesn't cost to the State; it doesn't cost the Federal Government. I know that this bill will make it impossible for a garage, filling station, or anyone engaged in business to do the inspecting, but we do license such businesses, and they make a nominal charge for the inspection.

If they are caught off base in their inspection, they lose their right to inspect. It costs them in business calls since it is immediately known throughout the community that they have lost their right to inspect.

Now, the law is enforced so rigidly that if a car is caught on the road without the latest inspection sticker, it is taken right off the road. The people in that car have to find some other way to get home. They have to have the car towed in and inspected. There is no fair or favor exercise.

My car just went up to New Hampshire. It had no inspection sticker. Before I had it driven to New Hampshire, I wrote to the highway safety commissioner and got written permission for it to go into the State to my hometown where it is inspected.

Now, it is a comparatively new car. However, when it was taken to the gas station where I have bought gas for 20 years, and it was inspected, my assistant, who is in New Hampshire, was informed that it didn't pass inspection. There was a slight hole in the muffler, which might permit exhaust to go through or cause some damage. The inspection certificate was denied me until the car was taken to the garage and repaired. We had to wait a week before it could be taken care of because the garage was so busy.

Now, you can probably look at the death rate in the State of New Hampshire and say that per capita it doesn't run so much lower than other States, and that will substantiate the statement that you made here today that you can see no difference. But I happen to feel that there is a difference. For example, we have a great many tourists in New Hampshire during at least 9 months of the year. We probably have tourists in nine out of 10 cars on the road, and a substantial percentage of our highway accidents and deaths involve cars from other States, not New Hampshire cars.

Our cars go off the road when they get to the point they don't pass inspection, and we don't have to have an expensive system to do it.

Now, I remember when we had the hearing a couple of years ago, the chairman of this committee, Senator Magnuson, said his State had a system of motor vehicle inspection but that the legislature wouldn't appropriate the money to do the job. Now, that situation may have changed. The chairman was saying it regretfully, and I certainly am not criticizing him. I am just saying that was one example.

Now, we don't have to appropriate money. We could go on the basis that a 50-cent or a dollar fee is not a hardship on a person who wants the use of the highways. So I just want to call your attention to the fact that this bill would set up an expensive system. However, the States perhaps can be forced to do their job right by denying cars registered in a nonperforming State entering interstate commerce. I can't see why you have to wait. I can't see why you have to take the other alternative in this bill to establish an expensive system of federally imposed inspection. I think that if you just hold the States' feet to the fire and make them do this thing right, that more can be done for automobile safety than any other one thing that can be done. I therefore must disagree with you that this is one of the things to defer.

Thank you, Mr. Chairman.

Senator HARTKE. Mr. Toms, go right ahead and finish your statement.

Senator COTTON. I am sorry. I shouldn't have interrupted at this point, but at the time you made that statement I couldn't wait any longer.

Mr. Toms. Furthermore, our amended highway safety program standard on inspection will require that a motor vehicle be inspected whenever the title of the vehicle is transferred or whenever any vehicle cannot be driven from the scene of a motor vehicle crash.

MOTOR VEHICLE REGISTRATION

The Department is in complete agreement with the objectives of S. 976 regarding motor vehicle registration and a uniform titling program as contemplated by the Uniform Motor Vehicle Code. Highway safety standard No. 2 is also being amended, at the present time, to incorporate these provisions. Therefore no additional legislative authority is required to accomplish this objective.

In summary, I must again address the question of priorities. The proposal the Department will submit would be a major new effort and would be additive to our existing safety program. We must insure that we do not cut into the essential efforts we are now making to improve traffic and motor vehicle safety.

This concludes my statement. I thank the chairman and the committee for the opportunity to comment and present the Department's views on S. 976. I would be pleased to answer questions and to clarify any items at this time.

Senator HARTKE. Thank you, Mr. Toms.

I would like to know, Mr. Toms, in view of the fact that this measure has been on the books since the latter part of February of this year and you now propose to submit a new major program yourself, just when we can expect that proposal to be in draft form and submit it to the Congress for introduction, if that is the intention.

Mr. TOMS. Mr. Chairman, I will assure you that the National Highway Traffic Safety Administration will make every human effort to get this to you as quickly as we possibly can.

Senator HARTKE. What is as quickly as possibly can?

Mr. TOMS. I would hope that we can have it in the range of—what? Thirty days, or 40 days?

Senator HARTKE. Well, we will be in executive session on this legislation before that.

Mr. TOMS. If we can do it faster, I will assure you and give you my personal pledge, Senator, that I will do everything that I can to get it in as quickly as possible.

Senator HARTKE. Was this an idea before this bill was introduced, or is this a reaction to the introduction of this bill?

Mr. TOMS. I think it is a bit of both, Senator.

Senator HARTKE. Bit of both?

Mr. TOMS. Yes.

Senator HARTKE. With the emphasis on reaction, right?

Well, I suppose if we pass this bill there will not be much need for yours, right?

Mr. TOMS. We think we have lots of good things in ours, Mr. Chairman.

Senator HARTKE. Well, I understand that.

I might just observe that in a matter in which there is a question of priorities evidently you must have not been of the opinion this bill was going very far, otherwise you would have reacted more quickly.

Mr. TOMS. I think I could say something other in addition. I think that we have a great interest in this field. We have had a lot of professional engineers and a lot of scientists who have had different views. I think that the more that we got into it and the more we

researched it and discussed it, we realized that it was a complex field that would take a great deal of effort. As these views begin to polarize and as these people begin to settle in and defend their beliefs, a considerable difference of opinion develops. As you begin to sort these things out and as people work them out, as within any agency or any group of professionals, you find that reaching a consensus takes some time.

Senator HARTKE. There have been rather lengthy hearings upon S. 976, and of course there are a number of areas in which there have been some questions concerning the actions of the National Highway Traffic Safety Administration. Let's take a couple of these. We'll start out on bumpers.

I wonder if you would describe for the committee the bumper standard which the Department of Transportation has announced.

Mr. TOMS. It requires for the 1973 model year passenger cars 5 miles, front, two and a half, rear, barrier tests with no damage to the safety items. It adds for the 1974 model year a pendulum with a ridge, 5 front, 4 rear, and includes a number of hits across the surface of the bumper, 30° angle strikes, and a bumper height requirement of between 16 and 20 inches.

I would like to emphasize, Mr. Chairman, that in our business one of the most important considerations is the height requirement. Although it is not contained in the committee's bill, this is most essential if you are really going to help the consumer in terms of damage and safety.

Senator HARTKE. Now, the authority to set the height requirement—is it in this bill?

Mr. TOMS. I had thought that it was not.

Senator HARTKE. In the Safety Act?

Mr. TOMS. Oh, we have the authority to set height, yes, and we have this in our rule.

Senator HARTKE. You want a new bill?

Mr. TOMS. We have a rulemaking action underway that requires a ridged pendulum to strike the front and rear surface facet of the vehicle without any damage to the safety items. The pendulum can strike anywhere between 16 and 20 inches. In our professional judgment, this is a good way to determine the height of bumpers.

Senator HARTKE. But as I understood it you criticized the bill in front of you for not requiring a height requirement.

Mr. TOMS. We just felt that this was a very important consideration and encouraged the committee to think in terms of the height of bumpers, because we think that, at least in terms of safety and in terms of truly preventing damage, bumper match is one of the most important considerations.

Senator HARTKE. Why should the committee think about it when we have already given you authority to act upon it in the Safety Act?

Mr. TOMS. And we have acted upon it.

Senator HARTKE. I do not mind thinking about it; if you want me to think about it for a while I will think about it.

Mr. TOMS. I just point out it is not in the bill.

Senator HARTKE. It does not have to be in the bill. You have the authority. Why should we feel that we have done something wrong by not including something in the bill that is not necessary to be in the bill. I have to admit I am perplexed by that reasoning.

Mr. TOMS. I just wanted to emphasize to the committee that we thought that this was important.

Senator HARTKE. It is important; we have discussed its importance. Now, as far as the bumper standards which you have at the present time, do they deal with safety only?

Mr. TOMS. That is correct.

Senator HARTKE. They do not deal at all with property loss reduction standards?

Mr. TOMS. That is correct.

Senator HARTKE. Just how safe are these regulations? In other words, how safe does it have to be? How far does it go? What components of the vehicle must not suffer damage?

Mr. TOMS. The standard covers such components as lights, hood, latch, trunk, muffler, tail pipe, radiator. In other words it covers those components that are in the direct vicinity of the front and rear bumpers of the car that we consider to be necessary for protection for safety.

Senator HARTKE. Is there any requirement that the vehicle be in a drivable condition afterwards?

Mr. TOMS. We think that this rule will assure such a condition. There is a——

Senator HARTKE. Is there any requirement that there be?

Mr. TOMS. We did not think it was necessary that such——

Senator HARTKE. Why not?

Mr. TOMS. Because we feel that the way that the rule is written that this goal would be for all practical purposes assured.

Senator HARTKE. Why can't you just say it?

Mr. TOMS. We could. We could add to it. We did not think it was necessary.

Senator HARTKE. After all, we are talking about these vehicles being in a drivable condition afterwards; isn't that the idea of making it safe?

Mr. TOMS. We feel that in 99 $\frac{9}{10}$ percent of the cases this will be assured by the way the rule is now written.

Senator HARTKE. Well, would the windshield have to be protected?

Mr. TOMS. We did not include the windshield because we are covering the hood.

Senator HARTKE. What about the windshield wipers?

Mr. TOMS. We do not think that the windshield wipers are likely to be damaged if they meet these conditions.

Senator HARTKE. And the side mirrors?

Mr. TOMS. Same with the side mirrors.

Senator HARTKE. What about the frame?

Mr. TOMS. The same with the car frame.

Senator HARTKE. The battery and the battery mounts?

Mr. TOMS. Same with those also.

Senator HARTKE. The hood?

Mr. TOMS. The hood is included.

Senator HARTKE. The trunk?

Mr. TOMS. Trunk is included.

Senator HARTKE. Door hinges?

Mr. TOMS. Door hinges, not likely.

Senator HARTKE. Not likely. Tires?

Mr. TOMS. We do not feel that they would be damaged.

Senator HARTKE. Brakes and wheels, steering mechanism? In other words, if the drive shaft should fall out of the thing it would still qualify.

Mr. TOMS. We do not think it would fall out.

Senator HARTKE. You say you do not think it would? What if it would?

Mr. TOMS. I suppose, Mr. Chairman, that if it proved to be desirable we can list literally every component of the automobile, but we do not think we are going to have any enforcement problem with these items.

Senator HARTKE. One of the presentations by insurance companies showed were the drive shaft completely dropped out.

Mr. TOMS. At 5 miles an hour?

Senator HARTKE. I'll check on that.

Mr. TOMS. I would like to see it.

Senator HARTKE. The speed was 10 miles per hour. The car was a 1971 AMC Ambassador DPLO.

How many cars in the market at the present time in your opinion meet the 1973 standards?

Mr. TOMS. How many cars at present can withstand a 5-mile crash with no safety-related damage?

Senator HARTKE. Right.

Mr. TOMS. Probably very, very few, Mr. Chairman.

Senator HARTKE. Are there any at all?

Mr. TOMS. Well, there are over 500 makes and models. I have to confess to you that I am not sufficiently personally aware of these 500 makes and models so that I can say with certainty that there is not one vehicle that could or would not.

Senator HARTKE. Are you familiar with the test which was submitted by Dr. Hadden?

Mr. TOMS. I am not intimately familiar with it. I have heard about it.

Senator HARTKE. You have just heard about it; you have not read it?

Mr. TOMS. I am sure that our engineers on bumpers have examined it very carefully.

Senator HARTKE. But you have not followed his testimony in these hearings at all?

Mr. TOMS. I read part of it.

Senator HARTKE. Are you familiar with the statement which he made after the film was shown in these hearings in which he said, "These are the six 1971 models which we found which met the standard even at 5 miles per hour, rear into barrier, and estimated the amounts of damage that they sustained," and then he gave the 1971 models, the Plymouth Fury I, Plymouth Satellite, Pontiac Firebird, Buick Skylark, Mercury Montego, Mercedes 220, and gave the estimates of the repair costs which were involved? You are not familiar with that?

Mr. TOMS. I have not followed their activities closely because their interest is in property damage. Ours is in safety.

Senator HARTKE. Theirs is what?

Mr. TOMS. In property damage; our work is in safety.

Senator HARTKE. You are asking for no damage at all, isn't that right?

Mr. TOMS. To the safety related items.

Senator HARTKE. Yes, and no damage.

Mr. TOMS. To its safety related items. We permit sheet metal damage in our rule. We do not have any authority to deal in the property damage field.

Senator HARTKE. I understand that this bill will give you that authority, and you do not want it.

Mr. TOMS. We are not sure that it is necessary——

Senator HARTKE. I did not say that. As I understand it you do not want it.

Mr. TOMS. We are not supporting the bill, that is correct.

Senator HARTKE. As I understand it you do not want it?

Mr. TOMS. I think that is correct.

Senator HARTKE. All right.

Wouldn't it be fair to say, though, that the safest car involved in any 5- or 10-mile-per-hour collision would be one that suffered no damage whatsoever?

Mr. TOMS. Not necessarily. It could be highly hostile and aggressive.

Senator HARTKE. Pardon me?

Mr. TOMS. It could be highly hostile and aggressive. Consequently it could transmit injury to occupants of other vehicles, because, Mr. Chairman, there will be old cars on the road for at least 10 years.

Senator HARTKE. You do have those standards for hostility and aggressiveness at the present time; is that right?

Mr. TOMS. We do not.

Senator HARTKE. You are including that in your ultimate design?

Mr. TOMS. We hope to document it, yes, sir.

Senator HARTKE. Assuming you have that, wouldn't it be better then to say that the fair assessment would be the one which would have no damage whatsoever under such circumstances?

Mr. TOMS. I think that you have to make several considerations, such as how you achieve it, how much it costs, and what the ultimate benefit is to the customer.

Senator HARTKE. Let me ask you, were you familiar at all with the Taylor device at the time that you promulgated the standards?

Mr. TOMS. I am not personally familiar with it, but my engineers are.

Senator HARTKE. They were or were not?

Mr. TOMS. They were; they still are.

Senator HARTKE. It was rejected? What comment do you have on the Taylor device?

Mr. TOMS. We never endorse a product.

Senator HARTKE. Pardon me?

Mr. TOMS. We never endorse a product.

Senator HARTKE. What is your comment on the device? Whether you endorsed it or did not endorse it, it was in direct conflict with the promulgation of your standards and intentions.

Mr. TOMS. Mr. Chairman, there are dozens and dozens of devices very similar to Mr. Taylor's on the market.

Senator HARTKE. Is it a good device?

Mr. TOMS. Sure it is a good device.

Senator HARTKE. Does it do more than what you say is necessary to be done at the present time?

Mr. TOMS. We are not so sure that in order to achieve the directives of our rule you have got to have the device on the bumper; there are other ways you can do the job, and we are not about to design the bumper for the manufacturer.

Senator HARTKE. I am not asking you that. You see, the essence of the argument very simply is whether or not it is reasonable and practicable to develop a bumper at this time which can meet a 5-mile-an-hour collision. Is that the problem?

Mr. TOMS. Sure.

Senator HARTKE. Isn't that right?

Mr. TOMS. Yes.

Senator HARTKE. Now, as to the Taylors, they came in and said they had a device and submitted it to you; and you had that in front of you at the time you promulgated the bumper standard?

Mr. TOMS. That is right.

Senator HARTKE. Now, all I am asking you, was that or any similar device—was that available? In other words, did you have anything to indicate that really when these people say they could not comply with higher standards, did you have any information, any type of contrary information to indicate that those people in the automobile industry who were saying they could not meet these standards, that in fact they could if they were willing to adopt what was in the marketplace at the time?

Mr. TOMS. And I said there were more than several dozens of such devices available in the marketplace.

Senator HARTKE. Why would you not then go ahead and promulgate that type of higher standard if that was available?

Mr. TOMS. We have a standard that we think does an adequate job of protecting safety related items. We in our time requirements require five and two and a half in the 1973 year, five and four added in the 1974 model year. We had every intention and still do of evaluating the state of the art. If we feel that it is justifiable to increase the rear to 5 miles an hour, we can do so. In fact, we are evaluating that right now.

Senator HARTKE. Is this a no-damage standard?

Mr. TOMS. Our rule is safety related; we permit sheet metal damage.

Senator HARTKE. Let me ask you again: taking into account the question of the aggressiveness and hostility aspect of it, isn't it really true—I mean, is there any question in your mind whatsoever that the safest standard would be one in which there would be no-damage?

Mr. TOMS. No, it is not clear in my mind. I am not sure that is true. Because you could get a no-damage standard and create a very hostile and aggressive car.

Senator HARTKE. I said, assuming that you take that into consideration.

Mr. TOMS. I am not sure that your point is clear, Mr. Chairman.

Senator HARTKE. Well, I would imagine that most people were rather shocked to begin with, except for the sophisticated people in this room, when they found out that most bumpers were not designed to withstand anything nearly, maybe, 35- to 40-mile-an-hour impact. So when they came down and said that the industry cannot develop one which was at 5 miles per hour within the time limit you gave them, why, it was really shocking to most of the unsophisticated people who drive

automobiles throughout the United States. But now we are coming back to the place where we take an additional step and say that even if you develop a standard, it will not be a safety standard that says no-damage, but it will be a standard at a safety point below no-damage. I would imagine that people will really be in a quandary as to what really we are talking about in regard to automobile safety.

Mr. TOMS. Well: minor sheet metal damage and safety isn't necessarily related.

Senator HARTKE. Well, let me ask you: Has any motor company in petitioning for reconsideration asked you to raise the bumper standard?

Mr. TOMS. I understand that Ford has submitted this.

Senator HARTKE. What do you mean by this?

Mr. TOMS. I have not seen the petition yet, but I read the paper.

Senator HARTKE. You read the paper. Well, let me ask you this: Did Ford Motor Co. file a petition with you on May 19 asking you to raise your bumper standards?

Mr. TOMS. Larry, has it been filed?

Mr. SCHNEIDER. Mr. Chairman, our docket section received an addendum to Ford Motor Co.'s petition for reconsideration dated May 19, 1971. I don't know the date which that was received, but it would have probably been either the 19th or shortly thereafter.

Senator HARTKE. You probably what?

You have had it since May 19?

Mr. SCHNEIDER. We either received it on May 19 or sometime thereafter. There is no stamp date on when it was actually received.

Senator HARTKE. Well, this is quite a departure from what you have had in the past, isn't it, with regard to the automobiles' manufacturers, in regard to their own standards.

Mr. TOMS. Yes; it is.

Senator HARTKE. But you didn't know about it until you read about it in the paper. Good thing we have got the newspapers around here.

Mr. TOMS. Hundreds of these things come into our docket section all the time. I must confess, I do not wait around to read them. They come in repeatedly from time to time, and that is what our attorneys are there for.

Senator HARTKE. No one reads them.

Mr. TOMS. Sure; our attorneys read them.

Senator HARTKE. What does he do with them?

Mr. TOMS. They evaluate them, and they analyze the petitions that have been submitted by the manufacturers and the public and they develop a position and they bring it to me for consideration.

Senator HARTKE. And the attorney thought there was nothing unusual about an automobile manufacturer coming in asking that you revise the standards upward, which is a notable departure from practically anything in the past, and you came here for congressional hearings today, and you still didn't know anything about it. The attorneys didn't advise you. You read about it in the newspaper.

What do you expect me to think about the efficiency of your agency, Mr. Toms?

Mr. TOMS. There has been an enormous amount of talk in the last few months, Mr. Chairman, about five and five bumpers, and we are privy to a good deal of proprietary information from the automobile

industry as to what they are doing on bumpers. I generally know what they are going to do and what they are thinking about long before it appears in the newspapers.

Senator HARTKE. Have you evaluated any of these other devices to which you referred, such as the Taylor device. I understand there may be as many as five or six different models as you have indicated on the market at the present time, which would provide for greater protection, and also provide safety at 5 to 10 miles per hour on bumpers.

Mr. TOMS. We have evaluated a good many, both in our experimental safety vehicle program and other programs.

Senator HARTKE. Do you find them effective?

Mr. TOMS. Yes.

Senator HARTKE. Why, then, would you set such low minimum standards?

Mr. TOMS. We don't think we have set low standards. We think that we were 2 years ahead of the requirement in the bill and that we have had height added and angular heights and both pendulum and barrier, that this is a better rule and does the job effectively.

Senator HARTKE. At 2½ miles per hour?

Mr. TOMS. We felt at that time that the evidence that we had, that it did a reasonable job of protecting the rear light, the tail pipe and the deck lid. We are in the process now of reevaluating this to see whether or not there would be sufficient economic payoff for the consumer to raise it to 5 miles an hour. If we should decide that this is the case, we probably will still do it well in advance of the time set by S. 976.

Senator HARTKE. Now, you have told this committee that your primary concern is for the safety of the people and the motor vehicle, and that is your primary concern, isn't that true?

Mr. TOMS. That is correct.

Senator HARTKE. You want to protect the people who are involved in the accidents themselves. Now, in examining the Department of Transportation bumper standards, many people have stated that it provides no protection whatsoever to the occupant in the vehicle.

Can you just explain to us why no maximum acceleration limits for the passenger were set forth in the Department of Transportation bumper standards.

Mr. TOMS. Because of our rule taking action on occupants and interior protection take care of that problem. We have requirements for padded dashboards, collapsible steering columns, and a host of other activities that accomplish that purpose on the interior of the vehicle.

Senator HARTKE. Well, is it true that under the present system that if an automobile crashes into an object that as far as the passengers are concerned he is first thrown forward, is that right?

Mr. TOMS. That is correct.

Senator HARTKE. And then he comes off with the same force practically when he rebounds, isn't that true.

Mr. TOMS. There is a certain degree of rebound, but it's entirely dependent upon the energy management device used at the instrument panel. And rebound of humans at those low speeds are insignificant.

Rebound is a consideration at the 50 g. upward level.

Senator HARTKE. Are you familiar at all with the Ford petition for reconsideration of the standards?

Mr. TOMS. You mean on the bumper.

Senator HARTKE. On acceleration, where they asked very definitely that certain maximum acceleration be established.

Mr. Toms. They are talking about vehicle, not occupant, as I remember it.

Senator Hartke. Is that in your standard.

Mr. Toms. What they are concerned about is the rigidity of the bumper, and how the entire vehicle would rebound against the barrier. We are considering that problem very carefully.

Senator HARTKE. But you have not made any change in that?

Mr. Toms. We may very well. We are analyzing it right now. This is one of the good things about rulemaking action, Mr. Chairman. In doing these things by administrative actions that you can make amendments and make changes as a state of the art changes.

I might add, Mr. Chairman, while there is a pause for a moment. We sure would have liked it if Ford would have taken the same position on the passive restraints that they took on bumpers.

Senator COTTON. I didn't quite hear that. What did you say?

Mr. Toms. Senator Cotton, I said it sure would have been nice if in the course of our efforts on passive restraints, Ford took the same position as it did on bumpers.

Senator HARTKE. Let me say to you that it would be nice if all motor vehicle manufacturers would take a very cooperative and forward-looking view, and I would hope that they would do so. But I certainly am not going to criticize Ford for taking a step which I think is contrary to its general trend, and if this is a good indication, let's not give them a slap on the wrist for taking one step forward, while the rest of them have taken two steps back.

Mr. Toms. Let's just push them a little harder and hope they get into some other areas, too.

Sure, we applaud them for that step, and we applaud the committee, but let's get them going in safety as well as property damage.

Senator HARTKE. Let's get them going all the way across the board. I agree with you on that.

Now, let me see if I can put back what concerns me at this moment. When you are talking about a bumper standard, when you are talking about protecting the individual person, the passenger in the vehicle, and when you refer in turn and say we already have taken care of all of the requirements necessary to protect the person inside the passenger compartment, are you leading me into the conclusion that all that is necessary to protect the passenger has already been done?

Mr. Toms. At those speeds we think we are in pretty good shape.

Senator HARTKE. At 5 miles per hour?

Mr. Toms. Yes.

Senator HARTKE. At $2\frac{1}{2}$ miles per hour?

Mr. Toms. Pardon me?

Senator HARTKE. At $2\frac{1}{2}$ miles per hour?

Mr. Toms. Obviously.

Senator HARTKE. I suppose in a way you may be right, and I hate to admit it, because when you are dealing at $2\frac{1}{2}$ miles per hour, I suppose, there is just not an awful lot of crashes at $2\frac{1}{2}$ miles per hour.

Mr. Toms. From the rear, you have the seat back and other things there, so that you are just not talking about the movement forward into the instrument panel.

industry as to what they are doing on bumpers. I generally know what they are going to do and what they are thinking about long before it appears in the newspapers.

Senator HARTKE. Have you evaluated any of these other devices to which you referred, such as the Taylor device. I understand there may be as many as five or six different models as you have indicated on the market at the present time, which would provide for greater protection, and also provide safety at 5 to 10 miles per hour on bumpers.

Mr. Toms. We have evaluated a good many, both in our experimental safety vehicle program and other programs.

Senator HARTKE. Do you find them effective?

Mr. Toms. Yes.

Senator HARTKE. Why, then, would you set such low minimum standards?

Mr. Toms. We don't think we have set low standards. We think that we were 2 years ahead of the requirement in the bill and that we have had height added and angular heights and both pendulum and barrier, that this is a better rule and does the job effectively.

Senator HARTKE. At 2½ miles per hour?

Mr. Toms. We felt at that time that the evidence that we had, that it did a reasonable job of protecting the rear light, the tail pipe and the deck lid. We are in the process now of reevaluating this to see whether or not there would be sufficient economic payoff for the consumer to raise it to 5 miles an hour. If we should decide that this is the case, we probably will still do it well in advance of the time set by S. 976.

Senator HARTKE. Now, you have told this committee that your primary concern is for the safety of the people and the motor vehicle, and that is your primary concern, isn't that true?

Mr. Toms. That is correct.

Senator HARTKE. You want to protect the people who are involved in the accidents themselves. Now, in examining the Department of Transportation bumper standards, many people have stated that it provides no protection whatsoever to the occupant in the vehicle.

Can you just explain to us why no maximum acceleration limits for the passenger were set forth in the Department of Transportation bumper standards.

Mr. Toms. Because of our rule taking action on occupants and interior protection take care of that problem. We have requirements for padded dashboards, collapsible steering columns, and a host of other activities that accomplish that purpose on the interior of the vehicle.

Senator HARTKE. Well, is it true that under the present system that if an automobile crashes into an object that as far as the passengers are concerned he is first thrown forward, is that right?

Mr. Toms. That is correct.

Senator HARTKE. And then he comes off with the same force practically when he rebounds, isn't that true.

Mr. Toms. There is a certain degree of rebound, but it's entirely dependent upon the energy management device used at the instrument panel. And rebound of humans at those low speeds are insignificant.

Rebound is a consideration at the 50 g. upward level.

Senator HARTKE. Are you familiar at all with the Ford petition for reconsideration of the standards?

Mr. Toms. You mean on the bumper.

Senator HARTKE. On acceleration, where they asked very definitely that certain maximum acceleration be established.

Mr. TOMS. They are talking about vehicle, not occupant, as I remember it.

Senator HARTKE. Is that in your standard.

Mr. TOMS. What they are concerned about is the rigidity of the bumper, and how the entire vehicle would rebound against the barrier. We are considering that problem very carefully.

Senator HARTKE. But you have not made any change in that?

Mr. TOMS. We may very well. We are analyzing it right now. This is one of the good things about rulemaking action, Mr. Chairman. In doing these things by administrative actions that you can make amendments and make changes as a state of the art changes.

I might add, Mr. Chairman, while there is a pause for a moment. We sure would have liked it if Ford would have taken the same position on the passive restraints that they took on bumpers.

Senator COTTON. I didn't quite hear that. What did you say?

Mr. TOMS. Senator Cotton, I said it sure would have been nice if in the course of our efforts on passive restraints, Ford took the same position as it did on bumpers.

Senator HARTKE. Let me say to you that it would be nice if all motor vehicle manufacturers would take a very cooperative and forward-looking view, and I would hope that they would do so. But I certainly am not going to criticize Ford for taking a step which I think is contrary to its general trend, and if this is a good indication, let's not give them a slap on the wrist for taking one step forward, while the rest of them have taken two steps back.

Mr. TOMS. Let's just push them a little harder and hope they get into some other areas, too.

Sure, we applaud them for that step, and we applaud the committee, but let's get them going in safety as well as property damage.

Senator HARTKE. Let's get them going all the way across the board. I agree with you on that.

Now, let me see if I can put back what concerns me at this moment. When you are talking about a bumper standard, when you are talking about protecting the individual person, the passenger in the vehicle, and when you refer in turn and say we already have taken care of all of the requirements necessary to protect the person inside the passenger compartment, are you leading me into the conclusion that all that is necessary to protect the passenger has already been done?

Mr. TOMS. At those speeds we think we are in pretty good shape.

Senator HARTKE. At 5 miles per hour?

Mr. TOMS. Yes.

Senator HARTKE. At $2\frac{1}{2}$ miles per hour?

Mr. TOMS. Pardon me?

Senator HARTKE. At $2\frac{1}{2}$ miles per hour?

Mr. TOMS. Obviously.

Senator HARTKE. I suppose in a way you may be right, and I hate to admit it, because when you are dealing at $2\frac{1}{2}$ miles per hour, I suppose, there is just not an awful lot of crashes at $2\frac{1}{2}$ miles per hour.

Mr. TOMS. From the rear, you have the seat back and other things there, so that you are just not talking about the movement forward into the instrument panel.

Senator HARTKE. What I am trying to figure out is how you are going to pull out this one part of the vehicle and just say, "Well, we have taken care of that and the other part of the vehicle." Now, without expressing an engineering judgment, I will say this to you. I am sure of one thing, that if that automobile is more safe as far as the bumper is concerned and protects against injury at 10 miles an hour, that is a much better bumper and is going to offer more protection for that person in the passenger part of that automobile than an automobile safety standard which is only, say, 4½ miles per hour.

Mr. Toms. That could be true, Mr. Chairman, but do not overlook the fact that there are many cars on the road today that have excellent sheet metal energy absorbing systems that will permit a lot of property damage but also provide excellent safety for the occupants.

Senator HARTKE. Yes, but you see, you are putting "either/or" on this endeavor, and I just do not want to do that. I am not one who believes in the first place that there is any prohibition on the Congress to consider economic factors, and you may find that you can eliminate economic loss and provide for maximum safety at the same time. It certainly is not just either/or, property damage or personal injury.

Mr. Toms. I think the real issue that is worth discussing momentarily is whether the consumer ought to have that choice.

Senator HARTKE. I think the consumer is entitled to have both, and that is the major difference between the two of us in regard to this bill.

Mr. Toms. That is not any different. I believe that a consumer ought to have the opportunity to buy a car that suffers very low property damage in crashes, but I am not so sure that we ought to say that everybody in America has to have that kind of a bumper if perhaps they do not want it, particularly when we consider that there are a lot of cars on the road that do a very fine job. This is particularly true of certain foreign models which do a very fine job of planning energy, but do not necessarily have property-damage-type bumpers. I think there might be something very well said to give the consumer that choice.

Furthermore, this is also true in certain forward control vehicles, sport cars, and off-road types of vehicles. There is a broad range of vehicles in this country, Mr. Chairman, that people would very much like to buy. Some of them do not necessarily lend themselves absolutely to 5-mile-an-hour low property damage bumpers, front and rear. I am not so sure that we ought to take that privilege away from the American consumer.

Senator HARTKE. We are going to cover that in a moment. We will take that up then.

But as to a related matter, when you talked about the different cars in the marketplace, have you taken into consideration the fact that there are a number of vehicles which are on the highway and which maybe the design of the vehicles may be one which certain individuals might like, but are in effect sort of moving weapons on the highway as far as pedestrians are concerned?

Mr. Toms. The pedestrian issue is very serious. It is an issue about which we are considerably concerned. However, it is not as simple as just getting an arbitrary panel of judges together and trying to decide what edge is hostile, or what edge is sharp, or what that hood ornament will do. It really requires a study of the dynamics of

the pedestrian. We do know that the shapes and noses of the front of vehicles have remarkably different effects upon the kinematics of pedestrians in a crash.

Now, Mr. Chairman, I regret to say that we just do not know enough about how to model the fronts of cars for accomplishing better kinematics in pedestrian crashes. We have done quite a bit of dummy crashes, but dummies do not act like human beings in the crash, and we have not found humans yet that we can crash. So there is a lot to be learned, and I do not think it pays to move off and begin to make arbitrary decisions on these designs, because we may do a poorer rather than a better job.

Senator HARTKE. When we first started these hearings—I do not recall whether it was 1965 or 1966—I remember at that time very definitely coming in here and seeing some of these front ends which were like weapons. I remember the spears, the sharp points, on the front end of vehicles which had been driven through individuals, through pedestrians. I remember, for example, quite vividly, the one dealing with the child being pierced right through the middle of the abdomen. At that time it was quite generally agreed upon that in the future at least we should try to avoid those things which would obviously assault and yet we do have at this time vehicles on the highway, as far as designs are concerned, which appear to give that same type of damage to the pedestrian.

Mr. Toms. The only one that I know of that you are probably concerned about is a hood ornament on the Monte Carlo.

Senator HARTKE. Well, you do not feel here that this 1971 Mercury Montego which has a W-shaped front end could act as a wedge and hold a pedestrian captive underneath there and throw him right under the vehicle?

Mr. Toms. W-shaped front ends have been a real concern to us.

Senator HARTKE. Have they expressed your concern to the manufacturer?

Mr. Toms. Sure. I think the issue here is, is the pedestrian thrown to the ground and run over? Is the pedestrian thrown into the air and possibly run over? Or is it better perhaps to hold the pedestrian against the vehicle and try to bring down the G forces? We really do not know.

Senator HARTKE. But you have expressed concern to Mercury about this?

Mr. Toms. We have not talked to Mercury definitely about that front end.

Senator HARTKE. Why not?

Mr. Toms. Because there are others also.

Senator HARTKE. You have not expressed concern to any of them?

Mr. Toms. No, we have not.

Senator HARTKE. I thought you said you expressed your concern to them.

Mr. Toms. Very definitely about pedestrian crashes.

Senator HARTKE. But not in regard to the style of the front end?

Mr. Toms. We are not sure that that front end is any worse than a number of others.

Senator HARTKE. But you suspect it might be?

Mr. Toms. We would like to know.

Senator COTTON. Mr. Chairman, may I be permitted to look at that, or is this entirely a one-man show?

Senator HARTKE. I can never upstage you, Senator Cotton.

Mr. TOMS. Those vehicles with a very low scope-like nose might be worse than that.

Senator HARTKE. Well, does the mere fact that something is worse than this one explain why you would not complain about this if it is bad?

Mr. TOMS. We complain about them all; we are constantly exercising these things with the industry.

Senator HARTKE. You have been writing to them, have you?

Mr. TOMS. I am not so sure about writing, but we sure do a lot of talking.

Senator HARTKE. But you have never written to them, right?

Mr. TOMS. Larry, do you know if you have written about that particular subject?

Senator HARTKE. Now, Mr. Toms, I am going to show this to you. A 1971 Pontiac Firebird; this has a very sharp nose on it. Does that present any concern to you whatsoever?

Mr. TOMS. I have watched that car crash in a number of tests and it would be my judgment that it probably is not among the worst.

Senator HARTKE. It is not among the worst?

Mr. TOMS. No.

Senator HARTKE. Is it among the best?

Mr. TOMS. I would not put it among the best.

Senator HARTKE. Why wouldn't you want it to do the best?

Mr. TOMS. Because we do not know what the best really is. We are really doing a lot of guesswork in this field. And until we do develop dummies that model the kinematics of a human in a crash—don't underestimate the difficulty of that, Mr. Chairman, because most of the pedestrians that are killed are kids, drunks, and old people. This fact imposes very serious problems on how to model these kinds of crashes and how to simulate dummies that will reproduce what happens in those crashes. Then you have got to take literally every kind of vehicle of every different shape and run it through that process. We have not found how to do that yet, nor has the auto industry.

Senator HARTKE. Don't you think kids and old people and even drunks are entitled to live?

Mr. TOMS. They are entitled to everything we can humanly give them, but we should not force something that we do not know how to do.

Senator HARTKE. Well, here is a 1971 Buick Skylark now that has almost all the limits of the thing we discussed—this came out in 1970. Four years later, after we had talked about this in these hearings and discussed some of these sharp projectile fronts there is a beak-shaped upper lip and pointed bumper, right?

Mr. TOMS. Yes.

Senator HARTKE. Then you mean to say that will not be more damaging in your opinion than one which had been flat?

Mr. TOMS. You mean flat or rounded?

Senator HARTKE. Or rounded, yes.

Mr. TOMS. Chances are, in terms of producing injury, that kind of an edge obviously would be more damaging than a flat edge.

Senator HARTKE. That is right. A 1971 Ford Galaxy resembles a small pointed weapon such as the old mace that we used to have in medieval times; is that right?

Mr. TOMS. I am not familiar with maces.

Senator HARTKE. Here is a 1971 Pinto. It has that same upper lip projected forward with the point, right? And the 1971—do you see that?

Mr. TOMS. Yes.

Senator HARTKE. That is a Chevrolet Vega. It is almost like a battering ram.

Mr. TOMS. Personally what bothers me more about the Vega that you just held up is the shape of its underpart—of the part of the sheet metal under the bumper.

Senator HARTKE. Did you complain about that to them?

Mr. TOMS. I have not personally complained about the nose of the Vega to GM.

Senator HARTKE. Well, you do not feel that this is in your realm of responsibility?

Mr. TOMS. Absolutely it is in our realm of responsibility.

Senator HARTKE. How do you get that responsibility translated into action if you do not direct something to these manufacturers along that line?

Mr. TOMS. I think that the most important thing is to really find out what happens in pedestrian crashes. We are working very hard on dummy development, and we are pleased to indicate that the industry recognizes this need now. I think we are getting a better test response from the dummies.

Senator HARTKE. I would hope you would learn more about that.

Mr. TOMS. I assure you, Mr. Chairman, we will.

Senator HARTKE. I would hope you would communicate your opinion to the auto companies in writing. You know, Mr. TOMS, one of the problems that we have heard constantly is the fact that people have said they have done things. I am not saying that you don't. I would imagine that you do. You know, somehow or another when you do it in writing, it gets through to the people in authority, and maybe they will—

Mr. TOMS. To be honest, it isn't our desire that is the problem. That is not the issue here. The question is how to do it. We have a great desire. I think our people are among the most serious people in safety in the entire country.

Senator HARTKE. I wouldn't expect you to say anything else, but that is all right.

Mr. TOMS. But, you know, we are also professionals who want to do the job right, and take a great deal of pride in doing it right.

Senator HARTKE. How much do you think you spend in effectuating this desire?

Mr. TOMS. I think our people have it.

Senator HARTKE. I know they have the desire, but how much money is spend and man-hours are spent to effectuate the desire that you say?

Mr. TOMS. You mean to the desire?

Senator HARTKE. No. How much in your department is spent? How much is being spent by your department?

Mr. TOMS. Our engineer's evaluating style?

Senator HARTKE. Style, yes. How much do you think?

Mr. TOMS. We really deal most in structure and in crashing, instrumentation, in trying to find out exactly what takes place, and this is why—we are sorry these films weren't better—we studied the slow motion films.

Senator HARTKE. Isn't the style a part of the aggressive nature of an automobile?

Mr. TOMS. We have said repeatedly that we felt that much too much money was put into style.

Senator HARTKE. It has been estimated that about \$2 billion a year is spent in the automobile industry on developing style, and what I am trying to find out really from you is how much is being spent on safety in styling by you as compared to the \$2 billion on style by the auto industry.

Mr. TOMS. We would be happy to try to sort that out.

Senator HARTKE. No use in sorting that out. Aren't you really saying that you spend a very small amount of money on it, and although you are concerned about it, your efforts are not there?

Mr. TOMS. There is no question that the industry spends a great deal more on style than it does on safety.

Senator HARTKE. Maybe the automobile industry could take judicial note, and if their representatives are in the room, maybe they can hear me loud and clear. If you are going to spend \$2 billion on style, you ought to spend at least an equal amount on safety, and I might say that if you don't do that, probably the Congress will.

Mr. TOMS. Thank you, Mr. Chairman.

Senator HARTKE. What about the bumpers in relation to trailer hitches? What study have you done on that, what results have you found? Do you have any indication that trailer hitches are unsafe, especially these hitches which are put on the bumpers?

Mr. TOMS. We have a program underway on trailer hitches, and I would like to ask John to give you what details he can.

Mr. EDWARDS. I don't have too much at my immediate disposal. Mr. Chairman, but we do have a program underway studying the stability and control capabilities of the automobile/trailer combination. It is being implemented now and should produce results by the end of this year. I would be pleased to provide specific information to the committee.

Senator HARTKE. This is a safety factor is it not, so we are not talking about economics at the moment?

Mr. TOMS. This is a safety factor.

Senator HARTKE. Isn't that right?

Mr. EDWARDS. Yes, sir.

Senator HARTKE. You agree with that?

Mr. EDWARDS. Absolutely.

Senator HARTKE. Why wouldn't it be a part of your safety problem then?

Mr. TOMS. I have a very strong feeling that trailer hitches should not be on bumpers. Trailer hitches ought to be attached to the frame and structure of the vehicle.

Senator HARTKE. Do you intend to promulgate a standard to that effect?

Mr. Toms. Yes.

Larry, we have issued a NPRM that specifies different classes of trailer hitches.

Senator HARTKE. Specifies them. I want to submit for the record a letter from an Illinois coroner who describes the way in which a Cougar bumper supporting a trailer tore away from the car with the result that the trailer crossed the highway, injured one person, and killed three others.

How far along are you in that field? Let me ask you that.

Mr. Toms. I think we are fairly well along. I can't cite exactly, but it would be my guess that when the study is finished that John has going, we will take a quick review of the NPRM that we have issued and we will move forward with the final rule.

Senator HARTKE. And this, for all intents and purposes, would remove trailer hitches from bumpers entirely; is that right?

Mr. Toms. Yes, it would eliminate unsafe trailer hitches. One of the things I thought you would bring up is that the trailer rental companies are quite concerned with our proposal. However, we still think our proposal is in the best interest of safety. In other words, when trailers are rented, the hitch is frequently attached to the bumper. Consequently our rule will vastly affect that market.

Senator HARTKE. You are not going to let the trailer companies just stop you if you really find it is a safety hazard, are you?

Mr. Toms. No.

Senator HARTKE. Let's come to the question of prices. Ford has testified here in these hearings that their improved bumpers may add as much as a hundred dollars to the cost of an average new car. And the statement in the press conference, they announced a new FFMVSS-215, you estimated a cost of \$40 to the manufacturer for the improved bumper.

Mr. Toms. Average.

Senator HARTKE. And testimony before this committee indicates that the cost maybe could be lowered to as much as \$30 per car. on an average.

Now, what in your opinion is the responsibility of your administration in arriving at a solid estimate? In other words, when can we expect some public statements from you as to your findings in this regard?

Mr. Toms. Ralph Nader has talked to me about this sort of thing, and he has sincere doubts as to whether or not we ought to, in the Government, talk prices and costs, or whether we should provide an environment in which the marketplace or competition controls these prices. I think he has a good point.

I think that we have to evaluate whether we ought to talk about original equipment manufacturer prices or whether we ought to just try to do everything we can to keep these prices at the lowest possible level. I admit that Mr. Nader has added a new dimension here. Again, I think that he has a good point.

Senator HARTKE. Isn't Mr. Nader talking about the question that he would like to get back to wholesale prices rather than retail prices?

Mr. Toms. In his communications to me, I didn't understand him to mean purely wholesale prices. This may have been a part of it. I didn't get that point.

Senator HARTKE. The testimony before this committee has indicated that sizable sums will be added in the next few years to the prices of new vehicles because of the new safety standards which your administration has enacted so far, or will enact.

Now, have you made any studies at all as to whether or not these estimates that the auto industry has made are inflated, or just exactly what the American people should know about the amount which is added for costs?

Mr. Toms. We have to recognize, Mr. Chairman, that the consumer always pays for safety features, the auto industry isn't in the business to make these things available for nothing. It is true that the original equipment costs to the manufacturer as it is translated to the consumer in the final retail costs, with the markups to accommodate the profit for the distributor and dealer, at least double, and in some cases even triple.

Senator HARTKE. But how far should you go? In other words, where is your role? How far should you go in making available to the public the information in this regard, and how much—should there be a ceiling put on the amount of costs that is involved? Wouldn't you be able to find what the actual increase amounts to?

Mr. Toms. Our cost and leadtime analysis people do give us their best professional judgment as to what these things cost. We find we usually give or take 15 percent pretty close to what these actual costs are. I am certainly not opposed to our making this information publicly available.

Senator HARTKE. What is wrong with the people knowing what your estimates are?

Mr. Toms. I think it could be helpful.

Senator HARTKE. I think it would be, too.

Mr. Toms. I wouldn't be opposed to it at all.

Senator HARTKE. Could you supply this for the committee as you move along in these various items?

Mr. Toms. I would be pleased to do so.

Senator HARTKE. All right. I think this will be fine.

In 1970, the insurance industry alleges that they paid about \$4,700 million in claims which were associated with damage to vehicles. It is estimated that of this amount approximately \$3,200 million went to the repair and replacement of motor vehicles and the other overall economic loss associated with vehicle crashes was more than \$16 million.

Do you have any estimates of the benefits in relation to costs for a property loss reduction program such as contained in the bill before us?

Mr. Toms. Jack, can you give those figures?

Jack Goldberg here has been working on this problem night and day, Mr. Chairman, and is probably my house expert on this subject.

Senator HARTKE. Pull the mike up there, so everyone in the back of the room can hear you, because they have to report on this.

Mr. GOLDBERG. Mr. Chairman, our data shows us that in the most perfect of all worlds a 1974 production run of vehicles with five and four bumper protection will result in the life of that production of a hundred thousand miles.

Senator HARTKE. How much?

Mr. GOLDBERG. A hundred thousand miles of the life of the vehicle of a 1974 model year. There would be a net benefit of approximately \$1 billion. Now, I must modify this by saying that a key ingredient is bumper mismatch. Because of this problem, net benefit can be expected to be severely limited in the first several years of the bumper installation. However, the bumper net benefit would get better and better as more cars have them.

Senator HARTKE. Now, that is if you adopt your standards, the minimum safety standards adopted by the administration, right?

Mr. GOLDBERG. No, sir. That is a full property protection standard.

Senator HARTKE. No damage?

Mr. GOLDBERG. No-damage standard.

Senator HARTKE. In other words, a no-damage standard?

Mr. GOLDBERG. Yes, sir.

Senator HARTKE. That is what is required in the bill.

Mr. GOLDBERG. Yes, sir.

Senator HARTKE. Now let's come to this question which we have alluded to before, the question of consumer information. In your statement, you said you were opposed to setting of Federal standards, if those standards relate purely to economic considerations as opposed to health and safety regulations, and I think you argued that the legitimate function of Government is to provide consumer information which will guide consumer choice in the marketplace and therefore encourage the production of automobiles which are less susceptible to damage and easier to repair. And then you say that your Department would provide the necessary consumer information to stimulate better design of vehicles; is that a fair statement?

Mr. TOMS. That is a fair statement.

Senator HARTKE. Pardon me?

Mr. TOMS. That is a fair statement, Mr. Chairman.

Senator HARTKE. Let's take a look, then, at your Department track record on providing relevant consumer information.

In a letter to me in 1969, the Department of Transportation said that they were proceeding ahead to develop a crash survivability index which would measure the way in which different cars protected occupants in a crash, and at that time I was told that by May of 1972, the crash survivability index would be available.

I wonder if you would tell the committee just exactly where we are in regard to this provision and provide a detailed report of the progress you have made in developing such an index since 1969?

Mr. TOMS. This is a broad subject, and I would like to start by having John indicate to you what we have done in attempting to move ahead in this program.

Senator HARTKE. Let me ask you first, will you provide for us a detailed report of the progress you have made in addition to what you say here today.

Mr. TOMS. Absolutely.

Senator HARTKE. Let me ask before you go on, will this report be ready by May 1972?

Mr. EDWARDS. I don't think so.

Mr. TOMS. No.

Senator HARTKE. Pardon me? I didn't hear that.

Mr. TOMS. I don't think it will be. And certainly one of the difficulties is the 500 different makes and models.

Senator HARTKE. All right.

Mr. TOMS. And the combinations.

Senator HARTKE. Let me ask you, if it's not going to be available by May 1972, when is it going to be available?

Mr. TOMS. OK, John.

Mr. EDWARDS. Mr. Chairman, I would like to take a moment to give you a feeling for the planning process that went on.

Senator HARTKE. I don't mind having a feeling, but I would like to have the date first.

Mr. EDWARDS. Yes, sir. But subsequent to June of 1969, and upon the arrival—

Senator HARTKE. Are you going to come to a date eventually?

Mr. EDWARDS. Yes, sir.

Senator HARTKE. All right.

Mr. EDWARDS. Upon the arrival of our new Administrator, we reviewed the entire crash survivability program, and, of course, reiterated the fact that the primary objectives of our safety administration was to save lives, reduce the number and severity of injuries resulting from traffic accidents, and to reduce the number of accidents. Comparative crash testing, which seeks to determine some overall survivability rating for vehicles that have already been designed, manufactured, sold, and now in use, could not, at that time, lead to the accomplishment of our prime objectives in a direct way, or within a clearly definable time frame.

Simply stated, what appeared to be a straightforward task in the first planning iteration, that is, rating vehicles, was upon closer examination, a very complex, extremely expensive activity which, if and when it could be done, offered much less potential payoff in terms of reducing deaths and injury than pursuing the crash survivability research program to develop the techniques, technology, and energy data which, through appropriate rulemaking, will lead to improved vehicle safety design and construction.

Now, with that as a background, then, our crashworthiness program emphasized improved occupant protection through the use of passenger restraints and energy-managing structures. Our safety program was established, as you know, so as to demonstrate that the crashworthiness capability which we were so seriously trying to achieve could, in fact, be demonstrated in a total systems environment.

Now, with that, then, we did not continue to pursue the development of a comparative crash survivability index. However, and this is the "however" I really want to emphasize: We have not abrogated the responsibility of trying to mathematically model the accident. In the ultimate, as you may recall, the comparative crash survivability index was going to be a function of the computer capability developed. That would be the ultimate end of that program. And we have pursued the development of computer models of the vehicle occupant. We have pursued the development of computer models of passenger restraint system, and we are beginning to pursue the development of models of vehicle structures which, because of their complex geometrics, because of the nonlinear quality of the response of the vehicle in a crash environment, make the work very tough for us.

But in terms of giving you an input that will indicate when that program will be feasible, we think that we can meet the requirement in section 124(d) of your bill by next June.

Now there is a date. We can give you a feasibility study by that time. Parts of that work are underway now, so we believe that we can meet the requirements of S. 976 for a feasibility study, but as to whether we are going to be able to publish quantitative ratings of the survivability of vehicles by weight class based on analysis of accident data with limited crash testing within the 30-month timeframe that we promised in our November 16 letter is a different question. I am afraid I would have to say that we are going to be at least 6 months or more late in doing that.

Senator HARTKE. I understand section 203 of the National Traffic and Motor Vehicle Act, the Department of Transportation was required to develop a uniform quality rating system for motor vehicle tires by September 9, 1968.

Has such a standard been developed?

Mr. TOMS. We are hard at work at it.

Senator HARTKE. No; I asked had it been developed?

Mr. TOMS. It has not been developed.

Senator HARTKE. All right.

Will you please describe the information which is contained in the consumer information bulletin which the National Highway Traffic Safety Administration has been putting out for the last several years?

Mr. TOMS. Talks about acceleration, braking, and passing distances; and tire reserve load is also in there.

Senator HARTKE. Pardon me?

Mr. TOMS. Tire reserve load.

Senator HARTKE. How many consumers utilize information which is contained in these bulletins.

Mr. TOMS. I don't think very much.

Senator HARTKE. How do they obtain the information if they want it?

Mr. TOMS. Through the dealer.

Senator HARTKE. Are the dealers under any legal requirement to provide this to the consumers?

Mr. TOMS. No; they are not.

Senator HARTKE. What will they have to do to get it?

Mr. TOMS. Well, you know, obviously, Mr. Chairman, if their car doesn't show up well in bulletin, the dealers don't do very much to distribute this in their showroom. I guess that is the wrong place to try to put it, because if their car does show up in the bulletin, they're going to do everything they can not to hamper their sale.

Senator HARTKE. What then, is your opinion of this program today?

Mr. TOMS. Seems to be the best way to go about this, No. 1 —

Senator HARTKE. I mean what about the program so far?

Senator COTTON. Why don't you let him answer?

Senator HARTKE. Why don't you let me ask my questions once.

Senator COTTON. I beg your pardon.

Senator HARTKE. I can ask my own questions, Senator Cotton.

Senator COTTON. Well, Mr. Chairman, I think the witness has a right to answer the question.

Senator HARTKE. If you want to ask questions, go right ahead. I will not interrupt you.

Senator COTTON. I am going to ask a few if I live long enough, but go right ahead.

Senator HARTKE. Go right ahead now, Senator Cotton. I will defer to you, sir.

Senator COTTON. That is very kind of you, but I would like to hear the answer to your question.

Senator HARTKE. Well, I will ask the question again.

What is your honest appraisal of the program today?

Mr. Toms. I think that it's not as effective as we would like it to be, I think that there are some things that we ought to try to do to make it more effective. I feel that we ought to make this information available to consumer magazines, and to the auto buff magazines that people read heavily in their decisions in buying a car. I think that we ought to go on television we ought to try to get public service time to communicate this information.

It's my humble opinion that the release of this information through dealerships is not the best way.

Senator HARTKE. Senator Cotton.

Senator COTTON. Mr. Chairman, it's your privilege to finish your questioning and I am not going to intrude upon you. You are the acting chairman of this full committee here today.

Senator HARTKE. I said I defer to you. I shall defer to you, sir.

Senator COTTON. All right.

Mr. Toms, how does it happen you are here today?

Mr. Toms. We were asked to come here to testify on S. 976.

Senator COTTON. I was informed that this was the only day that you could appear. You were going on some extended trip or something, and this hearing had to take place today because of your request?

Mr. Toms. Yes, it's convenient for us, because as you know, the Secretary is now negotiating an experimental safety agreement provision with the country of France, and I will next week be over there to continue the negotiations with the experimental safety vehicle agreement with the Government of France.

I will also be attempting to negotiate an agreement for a 3,000 to 4,000 pound safety vehicle with the Government of Germany.

Senator COTTON. How long will you be gone?

Mr. Toms. Be gone about a week or more.

Senator COTTON. Well, I want the record to show that this hearing is taking place while Congress is in recess. The Senator from Kentucky, Mr. Cook, and the Senator from Tennessee, Mr. Baker, have been, I understand, fairly faithful in attendance at these hearings. The Senator from Kentucky protested to the chairman and to me that the opportunity to talk with the man who is doing the administering of this job should come when they could be in town.

I have had to cancel speaking engagements, or the distinguished gentleman would have to have been here all by himself. I wouldn't want him to be lonely.

It's utterly impossible for other members to be here.

I think that this being a full committee, I want the record to show that although a protest was made, the decision was that the hearings should go ahead.

Now, I think that other members of this committee, such as the Senator from Michigan, Mr. Griffin, who was here for a few minutes but had to leave because he has speaking engagements during this recess, are interested in hearing your testimony. For example, Senator Griffin represents a State in which most of the automobile manufacturers are located. He therefore has a very real and intense interest in this subject. I am sure he would have wanted the opportunity to question you.

One of the penalties of being the senior Republican member is that it's up to me to see that we are represented. Consequently, since my colleagues could not be here, I had to cancel other things and be here.

I think that we are entitled, the committee is entitled to an opportunity to question you. I therefore want the record to show that I have protested and do protest this whole proceeding at a time when I doubt there is another member of the committee on either side in town. I know there isn't on my side of the aisle.

If it was done to accommodate you, then I must say, I don't think that you were treating the committee fairly.

If it was not done at your volition, then I still say that the members of this committee have not been accorded the privilege that should be theirs.

For the record, also, I would say, that there better be a quorum present when this full committee considers this bill. It's a highly important bill. And, in view of this proceeding today while the Senate is in recess, and practically all the members are out of town, I will insist upon a quorum. We should have an opportunity to hear you.

You are going to be gone a week. Well, I express the hope on the record, that the distinguished acting chairman will have you back here and give the other members of this committee an opportunity, after having read your testimony, to examine you about it.

Now, like the chairman I am interested in when this administration bill is going to get up here. I am constantly being placed in the position, as senior Republican member of this committee, of having to go to the chairman of the committee to request that we defer action until the administration gets its bill up here.

I was not entirely satisfied with your response as to when this proposed administration bill would be before this committee.

Can you give me more information on that.

Mr. Toms. I wish that I could, Senator Cotton. All I can do is pledge to you that I will do everything within my power to facilitate it getting here.

Senator Corron. I will be perfectly frank. Is this the same old story of the Department waiting for the White House to OK their version?

Mr. Toms. Well, certainly in a bill of this importance, there are a lot of parties who are interested in the position.

Senator Corron. Well, I noted in the chairman's opening statement—of course, I was not permitted to comment on it at the time—that he made as a flat statement that the White House was "pussyfooting" on this bill.

I ask you, is the White House "pussyfooting" on this bill?

Mr. Toms. Not to my knowledge.

Senator Corron. Well, I ask you again, and I am asking it as one who has to represent the administration on matters coming before this committee: Is the delay caused by the attempt of the Department of

Transportation to secure an OK from the White House on whatever made you—and by you, I mean the Department—state that you would submit a bill to this committee.

Mr. TOMS. It's true, Senator, that in a bill like this, it leaves the highway traffic safety—

Senator COTTON. I can't hear you.

Mr. TOMS (continuing). It's true that in a bill like this, that after it leaves the National Highway Traffic Safety Administration, and goes to the Transportation Department at large, I am not heavily involved. There has to be approvals. I am sure there are many agencies in Government that are deemed concerned about administration's position. I do not know the exact nature of the approvals and checkoffs, since I am not intimately involved.

Senator COTTON. Do you have any knowledge that would corroborate the chairman's statement that the White House is "pussyfooting" on this bill?

Mr. TOMS. I have no evidence to suggest that is true. In fact, I would believe, from my involvement, that it's not true.

Senator COTTON. Do you have a bill?

Mr. TOMS. Yes, we have been working on our position on this.

Senator COTTON. Is your bill completed?

Mr. TOMS. It's not completely completed in terms of all the language, but we have developed our position the way we want it to be.

Senator COTTON. Well, may I have just one or two examples of the fundamental differences between your bill and the bill we have before us?

Mr. TOMS. We feel we should not set property damage standards. We should make damage susceptibility information available to the consumer and attempt to induce the marketplace to bring about these changes.

Senator COTTON. Well, I am not quite sure I understand that answer. You don't mean by that answer that what you want is to put it up to the choice of the consumer as to whether he shall buy a safe automobile or a dangerous automobile? You don't mean that, surely?

Mr. TOMS. No, because we have the authority in safety. I only mean it in reference to property damage.

Senator COTTON. Now, did you ever design an automobile?

Mr. TOMS. I never have.

Senator COTTON. Did you ever build an automobile?

Mr. TOMS. No.

Senator COTTON. Has anyone in the Department ever designed or built an automobile?

Mr. TOMS. No, no one.

Senator COTTON. You have made no investigation to find out how many Members of Congress have ever designed or built an automobile?

Mr. TOMS. I never have.

Senator COTTON. If I understand your point, you are saying that you want to prepare and promulgate, after careful hearings and examination, every rule that is possible or practical to be promulgated to insure safety, or all possible safety in the construction of automobiles?

Mr. TOMS. That is correct.

Senator COTTON. Does that extend to the design of automobiles?

Mr. Toms. Only in terms of its structure and those things that deal with safety.

Senator COTTON. And you consider your task is to find a reasonable posture which insures every practical step that can be taken to make an automobile safe, but you want to keep out of the field of trying to tell the automobile manufacturers how to design, how to plan, and how to construct their automobiles?

Mr. Toms. That is correct.

Senator COTTON. Is that a fair statement?

Mr. Toms. That is a fair statement.

Senator COTTON. Do you consider the bill before us goes further than that, placing you in the posture of having the Congress dictate to the automobile manufacturer the construction and to a certain extent the design of automobiles?

Mr. Toms. That is correct.

Senator COTTON. Also, do you take into consideration the facts that in our efforts to care for the interest of the consumer, that what the consumer has to pay for automobiles also has to be considered to a reasonable extent?

Mr. Toms. Very much so. We are very concerned about costs.

Senator COTTON. In other words, is your objective to insist on every practical and effective safeguard in automobiles, but not to go into unrelated detail which could compel the consumer to pay a substantial extra sum?

Mr. Toms. That is correct. We feel that it is proper for us to deal in the fields of health and safety. But we are not so sure that we should deal in purely economic areas.

Senator COTTON. Now, I am going to appeal to the chairman of this committee, as I have said, to give the full committee an opportunity to examine you. You have said you will be gone a week. Can you be more specific about when you will be available?

Mr. Toms. Mr. Chairman, if it is the committee's pleasure, I will not go to Europe to engage in these negotiations.

Senator COTTON. Not much sense of your hanging around here during this recess, because there are no Senators here.

The Senate will be back in session by next Tuesday. How soon after that could you be back in the country and be available so as not to delay these hearing unnecessarily?

Mr. Toms. My present itinerary calls for me to return here on the 14th of June, but if it is the committee's pleasure to hold a hearing earlier than that time, I will be here.

Senator COTTON. Incidentally, concerning our earlier exchange on my State's inspection program, it is my recollection that the price of inspection in New Hampshire is set by the inspecting facility but it averages about \$3. I am also informed that this automobile inspection program, which is rigidly enforced, has had an appreciable effect on holding down the insurance rates in the State. I suggest that to you because of my hope—and I suppose every Senator is entitled to one—that more can be accomplished by a rigid inspection of automobiles than by any other method, except, of course, the matter of dealing with drivers. It can be done by States and we can see to it that the States do it in a serious manner.

I gather that you do not go along with that.

Mr. Toms. We believe that the State ought to have the right to conduct the kind of inspection program that it wants, as long as it is effective in removing the unsafe vehicles from the road.

Senator COTTON. Your last words are the crux of what you have just said to me. If States are not doing a job, they should be forced to do that job.

Mr. Toms. Yes; it must be effective.

Senator COTTON. And if it isn't effective, the cars from that State should face the possibility of being taken out of interstate commerce?

Mr. Toms. Well, we are hopeful that very soon we can identify precisely the characteristics of the car that lead to collisions and crashes and that we can then develop the vehicle in use standards that will assist the States in being sure that their inspection programs are more effective.

Senator COTTON. Yes, but the States will still have to contend with cars that are already built and already on the road. And, you can't take a poor man who has a 5-year-old car and can't afford a new one, and throw him off the road arbitrarily if he keeps that car in the best possible condition and it is carefully inspected.

Brakes are fully as important as bumpers, aren't they?

Mr. Toms. Yes. We tend to think that the most cost beneficial items in safety inspection would be tires, brakes, steering linkage, shock absorbers, and, to some degree lights.

Senator COTTON. I will be through now in just a second, Mr. Chairman. Is it necessary to wait until you have made all your studies and determined the characteristics of safety that you are going to require in automobiles to find the ideal automobile or the reasonably safe automobile? Do you have to wait until then before we tighten up on State inspection of existing automobiles on the highways? This bill goes so far as to—if I understand it correctly, and I am handicapped, because I have not been able to attend all the prior hearings, being here today because I am pinch-hitting—point toward a Federal inspection system.

Now, if you don't see to it, and see to it immediately, that the States are forced to do this inspection job seriously and faithfully under penalty of having the cars taken out of interstate commerce, then you are going to continue to have many States doing a very slipshod method of inspection while you develop your rules; is that right?

Mr. Toms. We are in the process right now of revising our motor vehicle standard.

Senator COTTON. Now, does the bill that you are contemplating sending up to this committee contain anything on the matter of inspection?

Mr. Toms. It does. It requires an inspection after a crash and when there is a change of ownership.

Senator COTTON. Well, that, in my opinion, is very inadequate.

Mr. Toms. Well, this is in addition to the present inspection standard, and that gives the State flexibility. They can have at least one per year.

Senator COTTON. But, with respect to the present inspection standards, many States are very lax in their enforcement of them. Don't you find that to be true?

Mr. Toms. For some States, this is probably a true statement. Some States do a very good job, and some do not do as good a job.

Senator COTTON. Well, why can't we take steps to see that they all do a reasonably good job?

Mr. TOMS. I think that when we can find ways to do this in a really cost beneficial way, so the consumer gets a full measure of value for the money spent, I think that we will be in a position to provide adequate enforcement.

Senator COTTON. I won't argue the point any more. I can't agree with you on that.

I thank you, Mr. Chairman.

Senator HARTKE. Since there has been a request made for reappearance of the witness, this hearing is going to be adjourned for that purpose until the reassignment of the witness, to be arranged by the chairman of the committee, and whatever agreement he can make with the ranking minority member as to our reappearance. There was no request for a continuance. There was this—

Senator COTTON. I beg your pardon. There was a request made to the chairman of the committee.

Senator HARTKE. Well, to my knowledge there was no request made for a continuance or postponement of this hearing. I assure the committee I am not in any way complaining about the fact that I am here today, but I was requested to do these hearings by the chairman of the committee, and it is not my desire at any time to move into these positions, although I frequently do take assignments when no one else is willing to take them.

Senator COTTON. Mr. Chairman, may I say to you, first, that I sincerely compliment you on the thoroughness with which you and your staff have gone into this subject, as indicated by your very searching and able questioning today.

I am not, in any sense, objecting to your conducting these hearings when the chairman requests you to do it. I think you perhaps are better informed or as well informed as any member on this committee. But I did formally protest to the chairman at the request made to me by other members of the committee, that they would have no opportunity to examine Mr. Toms, who, after all, is the man more than any other person responsible for the enforcement of these matters.

I did make that protest, not because I objected to your conducting the hearing, but because I thought the hearing should have been scheduled when all the Senators are not out of town and thereby afford them an opportunity to participate. Then, if they don't come, it is their own responsibility.

But I want to make it very clear, I was not criticizing you, sir.

Senator HARTKE. I didn't assume that you were. The fact remains that we are going to continue these hearings. I want to repeat the statement I made about the overseers at the White House concerning "pussyfooting" that is going on in regard to this program. I think it is "pussyfooting." I think it is deplorable. I think it is an unsatisfactory performance in view of the number of people who are killed on the highways, the fact that auto accidents are a No. 1 killer of our young people in America today and ranks next to some of the diseases such as heart disease, which generally affects old people, as almost an epidemic.

The attitude is not merely in regard to this legislation, but in regard to the problem itself. Unfortunately, the administration has not shown the concern which I think humanity is entitled to receive.

I point as evidence of that the fact that there is authorization for \$40 million for this year in the field of automotive safety for this administration, and yet the administration saw fit only to request \$31 million plus a few hundred thousand, for this program.

In other words, it did not see its way clear to avail itself of the opportunity to the capacity which Congress felt was necessary, and I might say that I don't think that the Congress has been overly generous in its consideration in this field.

So I do not retract in any way that feeling.

Senator COTTON. Well, those of us who also sit on the Appropriations Committee, as a number of members of this committee do, can take care of the appropriations. We don't necessarily have to take the view of the White House. But, I wouldn't expect anything that this White House would do would satisfy the Senator from Indiana. I simply wanted to find out what specific evidence there was to sustain that statement that the White House was "pussyfooting" on this legislation.

We are getting into politics, but we can't legislate without some politics. Nevertheless, I am not prepared to swallow that statement yet until I find out.

Senator HARTKE. All right. This meeting is adjourned, and the return of the witness will be at the determination of the chairman of the committee.

Mr. Toms. Thank you, Mr. Chairman.

(Whereupon, at 12:30 p.m., the hearing was adjourned, subject to the call of the Chair.)

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

WEDNESDAY, JUNE 16, 1971

U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.

The committee met, pursuant to call, at 10:12 a.m., in room 6206, New Senate Office Building, Hon. John O. Pastore presiding.

Present: Senators Pastore, Cannon, Baker, Cook and Stevens.

Senator PASTORE. The hearing will please come to order.

I want to express apologies to the witnesses and the people who have assembled here, and the press as well, for the delay that was caused this morning. As most of you know, these are busy times, and the Senators are committed all over the lot, thus there was a delay. I am just pitching in as a substitute for Mr. Moss. As I understand it, he is very much involved in the President's energy program, and he is chairman of the subcommittee that is dealing with that. That accounts for his absence here today.

Now, today the Senate Commerce Committee resumes these hearings on auto insurance reform proposals directed at the compensation delivery system and the automobile which is an integral part of that system.

This morning we will again hear from Douglas W. Toms, Acting Administrator of the National Highway Traffic Safety Administration.

The minority members of this committee requested that Mr. Toms be given the opportunity to reappear so that those members of the committee who were absent from the city during the recess would have an opportunity to hear and question Mr. Toms.

This hearing date was fixed by the chairman of the committee with the concurrence of the majority members.

Mr. Toms, we want to welcome you again. I don't know if all the majority members are here who are interested but—

Senator COOK. I would hope, Mr. Chairman, that all the minority is interested.

Senator PASTORE (continuing). We have one of the most distinguished members or colleagues, a very dear friend of mine, the Senator from Kentucky, Mr. Cook. If they are not here, he can take care of whatever they have to say.

All right. You may proceed, Mr. Toms.

(1861)

**STATEMENT OF DOUGLAS W. TOMS, ACTING ADMINISTRATOR,
NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION; AC-
COMPANIED BY JACK GOLDBERG, ASSOCIATE ADMINISTRATOR
FOR PLANNING AND PROGRAMING; ROBERT CARTER, ASSOCIATE
ADMINISTRATOR, MOTOR VEHICLE PROGRAMS; JOHN EDWARDS,
ASSOCIATE ADMINISTRATOR, RESEARCH AND DEVELOPMENT;
AND LAWRENCE SCHNEIDER, ACTING CHIEF COUNSEL**

Mr. Toms. Mr. Chairman, Senator Pastore, Senator Cook, I welcome the opportunity to appear again before this committee to present the administration's views concerning S. 976 and a bill which the administration feels will more effectively and more efficiently serve the needs of the consumer in this area.

My prepared statement on May 28 discussed fully both our problems with S. 976 and the administration's alternative proposal which was then under preparation. I will, therefore, confine this statement to the highlights of the matters under review here today.

The bills that you are considering deal primarily with economic problems. They concern the automobile owner's pocketbook, not his life or limbs. No one who works daily with automobiles can fail to appreciate the strains imposed upon the pocketbooks and nerves of Americans by the more than \$6 billion worth of property damage incurred by automobiles annually.

However, there must be priorities. Our priority is safety. In 1970, the upward trend in fatalities was reversed, and the fatality rate was the lowest in automobile history.

If these encouraging signs were causing us to become complacent about the future, the January 1971 increase in fatalities of 8 percent was enough to shock us out of our euphoria. Although there was a total reduction of 16 percent for February and March as compared with the same period last year, fatalities increased 8 percent in April 1971 over April 1970. At present, this year's fatalities are about even with those for the same time last year. We anxiously await each month's statistics as we ride the thin edge of success or setback.

In short, unless we diligently pursue our priorities in safety, the fatality count could shoot skyward again.

I stated previously, and I will repeat, money will not buy back a single lost life or limb. So nothing must be allowed to deter us from achieving our safety goals. Nothing must be allowed to dilute our safety efforts.

Our major objection to S. 976 is that it would require the establishment of automobile standards for purely economic reasons. We believe that the vigorous regulation of industry in matters of health and safety is a proper and a necessary role of Government. Recent Government actions in automobile safety, emission control, and other matters of health and safety have amply demonstrated the wisdom and benefits of such regulation. However, we do not believe regulation of purely economic matters would be appropriate or desirable.

The Committee on Interstate and Foreign Commerce of the House of Representatives, in reporting to the floor the National Traffic and Motor Vehicle Safety Act of 1966, stated:

* * * The other major difference between the bill as introduced and as reported is the elimination from the latter of all references to property damage as an

element to be considered in establishing Federal safety standards. The committee believes that the emphasis of this legislation should be on the protection of persons rather than the protection of property, and to eliminate any possible conflicts restricts the bill to considerations which relate to the safety and protection of persons.

The Senate committee, this committee, also considered and eliminated property damage reduction as an objective of the Safety Act.

Senator PASTORE. Could I interrupt you, Mr. Toms? Of course, I am not an expert on this particular subject. Some of the other members of the committee have been hearing the testimony. I regret this very much. But why can't we have both? I mean why do you object to the economic involvements here? We did pass the Auto Safety and Highway Safety Acts. Those had to do with the protection of life and limb.

Now, will you admit this? I mean from a practical point of view—and I meet this very day—I have people write to me and tell me that their insurance has been canceled and they can't buy insurance, which has led a lot of people to this program of no-fault insurance.

Now, I think it is a dangerous thing if a person who wants to buy insurance can't go out and buy that insurance, because he needs that protection. He may say, "Well, it's economics." But I mean you could actually go broke and you could put your family in dire circumstances unless you could give them this protection in case of an accident.

Now, the point I am making is this: Unless we do something about reducing the cost of the damage that takes place in an automobile, we will never be in the position of telling an insurance company, "Look, you have got to cut down your rates for the simple reason that you are not paying out as much as you used to."

So it does have an effect. And it is what an insurance company has to pay out in the ultimate which compels that insurance company to say to a person who wants to buy the insurance "We can't sell it to you because you are too much of a risk."

Now, I can't assimilate that. If you are telling me that it is more important to protect life and limb, I go with you a hundred percent. But if you are telling me that it is no concern of this Congress that we should take care of the economics involved. I don't follow you. I am lost.

If you could tell me in simple English why you feel that way, I would appreciate it.

Mr. Toms. Basically, we feel that the reduction in insurance rates—in other words—the profits that the insurance industry has realized already this spring indicate that there has been a reversal and that these costs are coming down.

We feel, too, that the reduction in deaths is a good sign.

We think that the amendment we have made to our bumper standard will go a long way to correcting many of the problems of property damage.

We have a philosophical problem about becoming involved in the designing of automobiles or getting into the regulation of the automobile industry for purely economic reasons.

We think that many of the concerns of the American public are going to be corrected as we move forward with our program. We think that it is not necessary for us to take this extra step in pure economic regulation. We think that these economic benefits will come anyway.

And as we get later into my statement, Mr. Chairman, I would be happy to amplify some of the amendments that we have made and how we feel they will do the job.

Senator PASTORE. All right. Then you proceed, Mr. Toms.

Mr. TOMS. We believe that the actions of the Congress in 1966 were correct. We believe that the reasons underlying this action still apply.

There is no doubt, however, that the consumer deserves a better break in the marketplace. The President's message earlier this year on consumer affairs indicated his commitment to this course. Assistance to the consumer can be rendered most effectively through adequate consumer information. The administration's bill will enable us to study and, if feasible, implement a program to provide this consumer information in what we believe to be the most efficient and economic manner possible.

Let me now describe the various provisions of the administration's proposal.

CONSUMER INFORMATION PROGRAM

The administration's bill would give the Secretary of Transportation the authority to do the following:

1. To develop and disseminate as widely as possible information on the damage susceptibility and crashworthiness of all major makes and models of automobiles if the development of such information is feasible and beneficial to the public interest.

2. To request, and, if necessary, require, automobile insurance companies to furnish the Department with accident claim data relating to personal injury and property damage and the cost of remedying the damage. The data would be used in determining the feasibility of the program and to develop such consumer information.

3. To require automobile insurance companies to furnish the Department with a description of the extent to which their insurance rates or premiums for automobiles are affected by the damage susceptibility and crash worthiness of individual makes and models of automobiles.

4. To require automobile manufacturers to furnish the Department with information relating to their efforts to improve the crashworthiness and reduce the damage susceptibility of their automobiles. The Secretary would have authority to make this information available to the public with appropriate safeguards.

5. To conduct a research and testing program, including the crash testing of automobiles, to aid in determining the feasibility of developing the consumer information and in developing such information.

Senator PASTORE. Are there any enforcement rights in your suggestion?

Mr. TOMS. No.

Senator PASTORE. This is just a matter of information, so after you go through all this expense and you get the information, then you could either take it or leave it?

Mr. TOMS. It has been our experience, Mr. Chairman, that when this kind of information is made available to the public and the industry, and as we pursue this kind of material from the industry, that the marketplace does an excellent job. Note the activities in passive restraints and in bumpers in the auto industry.

Senator PASTORE. If the marketplace did an excellent job, we wouldn't have to have all this legislation to protect the consumer, would we? But we have found out over the years unless we put some teeth in the law and protect the consumer—I mean the FTC is doing that every day. They are asking for more authority. As a matter of fact, I want to complement this administration. They are really doing something down at the FTC.

But I am telling you this protection doesn't occur without compulsion.

Mr. TOMS. I think, Mr. Chairman, that as we analyze the behavior of the States under our State and community safety programs, we find a lot of pride involved. The States hate to be at the bottom of the list in performance. They hate to be declared to be the poorest in the public eye. They strive very hard to do their best.

I find in the automobile industry the same is true. When one takes a step to provide more safety or better protection, the others follow very quickly.

I think the problem in the past has been that there has been no action in this area whatsoever. There has been literally no governmental involvement. And I think that now that the NHTSA is in the safety field and moving forward, we will see substantial progress.

If, in the future, we come back to this committee and we are able to show these things are not working, then we would be the very first to step forward with the necessary remedies to get the job done.

But I am a little cautious to ask for more than we need when we are fairly confident that what we are presenting here will do the job.

Senator COOK. Well, Mr. Toms, let me ask you in that regard, under your consumer information program, item 1, to develop and disseminate as widely as possible information on damage susceptibility, is it now the policy of the DOT that they are going to ask for full implementation and a full budget for their automobile damage studies and their checks?

As you well know, it developed at hearings prior to your testimony that the insurance companies actually give a larger budget to their association to test automobiles and to go out on the open market and buy automobiles than the Department of Transportation puts into its program.

Mr. TOMS. Well, of course, they haven't the kind of authority that the Government has.

Senator COOK. I know, but the point I am trying to make is frankly they are doing a better job. They are doing a better job of testing automobiles. They showed us films at the hearings of collisions at 5 miles an hour, 10 miles an hour, 15 miles an hour. And yet the gentleman who testified, who is in charge of the laboratory, whose name I have forgotten—

Senator PASTORE. Dr. Haddon.

Senator COOK. Dr. Haddon—is a former employee of the Department of Transportation. He said that one of the unfortunate parts of the program in the Department is that actually they have a smaller budget to test automobiles than he has from the combined insurance companies throughout the country.

Mr. TOMS. Senator Cook, his point was to exploit the problems in property damage, and we have not had that authority. We think that this program—

Senator PASTORE. Would you excuse me for just a moment? Can everybody hear what the witness is saying?

Senator COOK. To go back to your item 1, Mr. Toms, to develop and disseminate as widely as possible information on the damage susceptibility and crashworthiness of all major makes and models. This means you are going to have to do it just like they are doing it. Now, I think we are talking about a parallel situation. And I am wondering whether the Department is going to be enthusiastic enough to fully fund this program and get it in major operation.

Mr. TOMS. We think that we will be able to, Senator Cook.

Senator COOK. All right.

Senator STEVENS. May I inquire? Is it necessary for the insurance companies, the industry and you to be spending the amount of money they plan to spend to test these automobiles, and in effect, spend the taxpayers' money.

Isn't there some way to set standards for testing so that they can be certified and the consumer won't have to pay three times to test the same automobile?

Mr. TOMS. We will be getting this information, Senator Stevens, from the automobile industry. We will also have our own crash testing program going on. We hope to go back into accident records of insurance companies and of States. We expect to be able to make these comparisons and then present an index or present a comparison of these makes and models to the public.

Now, one of the problems will be trying to get this information all put together in a new model year to give the public information about the new model coming out. That is going to be very difficult. We think that we can present something to the consumer.

We think that we can provide a great deal of relevant information about crashworthiness and damage susceptibility of cars that are at least 1 year old.

Senator STEVENS. It seems to me that the insurance companies, the industry, and the Government ought to be interested in getting such information to the public before the first one is sold.

Mr. TOMS. I think that—

Senator STEVENS. It is the first new group that is going to spend the money to buy the automobiles. Then they are going to read 6 or 8 months later your consumer information which reveals it is not a very good model. Somehow I think you ought to get together.

Mr. TOMS. I think that there will be a good bit of information that will be available on them, because the manufacturers are testing them approximately 8 months or a year before they go on the market. But they often make last-minute changes. And no matter what kind of a program you have, you are not going to know until some of these cars are out in the real world what their damage susceptibility is going to be.

So we will just have to do our best to try to disseminate this information so that people can make these comparisons.

Senator STEVENS. Thank you. Thank you, Mr. Chairman.

Senator COOK. I might add to that, Mr. Chairman and Mr. Toms. Apparently I owe you an apology. The Department of Transportation has submitted a proposal for construction of its own testing facilities, but it is waiting for the approval of the Commerce Committee and then it will go to the Public Works Committee.

So I think this was pursuant to the request of the House Public Works Committee; was it not?

Mr. TOMS. That is correct.

Senator COOK. So apparently the fault, at least part of the fault, has to lie up here and not down at the Department of Transportation.

Mr. TOMS. We haven't had our own testing facilities. We need these facilities very much.

Mr. Chairman, shall I continue?

Senator PASTORE. Yes. You may proceed.

Mr. TOMS. The first major consumer information program for automobiles was established under the Automobile Information Disclosure Act of 1958. This act required that purchase cost information be displayed with new automobiles offered for sale. This was the first time the consumer got a reasonable break in making an informed choice in the selection of his automobile. While there have been problems with this cost information, certainly no one would recommend its elimination.

This leads me to a discussion of the present consumer information regulations of the National Highway Traffic Safety Administration. In these regulations, we are attempting to put together a mosaic of information which, when taken together, represents a fairly sophisticated profile of vehicle safety performance details. Some say that this program has not been as effective as it might be. The reason is that we have now only three tiles in the mosaic. The items of consumer information that we report on are: (1) Stopping distance, (2) Tire reserve load, and (3) Passing acceleration.

We have determined that publishing a regulation for consumer information, with an objective test procedure, is just as difficult and time consuming as issuing a safety standard. Therefore, we have concentrated our energies on developing safety standards to insure that all purchasers of new passenger cars receive a motor vehicle with a basic level of safety.

The program we are proposing here today is conceptually different from our current consumer information program. Our proposed program more closely resembles the Information Disclosure Act in that it requires information relating to the total vehicle.

The most frequent question that we, as safety professionals, are asked, is: "What car should I buy?" There is no specific answer to this question. The answer is dependent on individual needs, values, and tastes.

Although we cannot give a specific answer to this frequently asked question, we can provide the consumer with information to assist him in his choice. If our program is determined to be feasible, it will provide information on damage susceptibility and crashworthiness of all major makes and models of automobiles. We think that this information will go a long way toward providing the consumer with the basic information that he needs to make an informed choice in the marketplace.

We are also wedded to the concept of maximum consumer information from other standpoints. We have recently established an Office of Consumer and Public Affairs which will devote itself exclusively to the development of better means of informing the public on the vehicle and equipment which they use. We have a wealth of research

and engineering information within the organization. Much of this can be translated into consumer information to provide very valuable guides to the consumer on safe operation and maintenance of his vehicle.

The National Highway Traffic Safety Administration also has issued public advisories which are designed to inform automobile owners on specific safety problems. We have initiated the concept of the consumer protection bulletin under which information gathered in our defects investigation program is released to the public just as soon as we have learned that there is a likelihood of a serious hazard to motor vehicle safety.

The National Highway Traffic Safety Administration has taken some steps to provide consumer information in all areas. The program is and should be much broader than crashworthiness and damage susceptibility information by make and model of vehicle, although this will certainly be the heart of our consumer information program. We recognize that much effort is still required to determine the best type of information to provide the consumer and the best manner in which to provide it. We must develop the most effective way to promulgate the information so that it reaches the maximum number of consumers and is in a form that the consumers can comprehend.

We believe that the administration's proposed legislation would provide a substantial improvement in the consumer information presently available to the public under the Automobile Information Disclosure Act and our present consumer information program. This legislation could provide the consumer with information, by make and model, relating to the safety and damage susceptibility of new and recent model year automobiles. Naturally, we will first explore the feasibility of this program to assure that we will be able to provide the most accurate information and information that would be truly useful and beneficial to the public.

The consumer now knows that when he purchases a new automobile, he is receiving a motor vehicle that complies with all applicable Federal safety standards. However, he has no way of determining the extent to which the different makes and models of automobiles exceed the required levels of safety performance. Further, he cannot determine the damage susceptibility of the different makes and models. Without the ability to evaluate the automobiles, he cannot go comparison shopping for the make and model of automobile that possesses the level of safety and damage resistance that suits his taste and needs. The administration's bill would give us the authority and resources to conduct a vigorous consumer information program to eliminate this information gap.

Mr. Chairman, I would like now to give you a status report on our reevaluation of Federal Motor Vehicle Safety Standard No. 215, Exterior Protection, which is the bumper standard. A press release on April 14, 1971, announcing the issuance of the exterior protection standard stated, "The Traffic Safety Administration noted that further work is in process to refine or add to the requirements for 1974 model cars."

The purpose of issuing the standard at that time with that caveat was to insure that the initial requirement for 1973 model-year vehicles could be met. The effective date for 1973 models then was less than 18

months away. Materials and tools had to be ordered. We had run out of time and could not wait for completion of our evaluation of the 1974 models.

I also indicated to this committee on May 28 that this standard was under a continuing reevaluation.

We are today publishing a notice of proposed rulemaking specifying higher performance requirements for the 1974 model year. We are requiring 5 mile-per-hour protection for both front and rear bumpers as established by impact into a barrier with the engine operating at idle speeds. The requirement for successive strikes by a pendulum is also being retained, although we are modifying the face of the pendulum somewhat. This will, we believe, control the bumper mismatch problem.

The previous standard required protection of lighting, hoodlatching, fuel, cooling, and exhaust systems. The NPRM issued today will expand coverage to all safety-related vehicle systems such as suspension, steering, and braking. It is intended that the vehicle bumper system be required to protect the vehicle from all damage that affects safe operation.

We believe that these requirements are stringent enough to make it impractical for manufacturers to design bumper systems that do not offer full protection to all parts of the vehicle except, of course, the face of the bumper itself.

SUMMARY

We oppose S. 976 and feel that the administration's proposal will be both more efficient and more effective.

Mr. Chairman, I would be pleased to answer any questions and to clarify any of these items at this time.

Senator PASTORE. Mr. Cook.

Senator COOK. Let me pass for just a minute, Mr. Chairman.

Senator PASTORE. Mr. Stevens.

Senator STEVENS. Do I understand this last statement to mean that you are going to have a regulation for 5 and 5, front and back, for 1974 and you are going to continue with the face-to-face bumpers—although I'm not sure of its technical name.

Mr. TOMS. The 5 and 2½—

Senator STEVENS. The height concept—in 1975?

Mr. TOMS. No, the height requirement will also be in effect in 1974.

Senator STEVENS. They will both be in 1974?

Mr. TOMS. Yes. The present rule is that it will require bumpers to pass a barrier crash, 5 front, 2½ rear, for 1973. As you know, 1973 models are in the development process now. For 1974 it will require the bumpers to pass 5 and 5 barrier tests and 5 and 5 pendulum tests. The pendulum is the device that we employ to assure bumper height match.

We feel the bumper mismatch problem is the real heart of the damage issue. As I hold up these pictures, Mr. Chairman and members of the committee, you can see very quickly that very few of our cars have bumper height match.

Senator COOK. As a matter of fact, it became obvious during those test movies, Mr. Toms, and I think the staff will agree, that on practically every car we watched during that demonstration, the bumper was behind some particular ornamental point on the hood, so that the hood itself struck the barrier before the bumper did.

Mr. TOMS. You see, there are cars with enormous mismatch. With the chairman's permission, I would like to submit these pictures for the record because they illustrate the need for the pendulum test and to protect against mismatch.

(The pictures referred to follow:)

FIGURE 1A.—Variation in height of leading edge of face bar—left, 68 Pontiac GTO (29 inch) ; right, Alfa Romeo (16½ inch)

FIGURE 1B.—70 Alfa Romeo front versus 68 Pontiac GTO mismatch

FIGURE 2A.—Variation in height of leading edge of face bar—left, 70 Mercury Montego (22 inch) right, 70 Volkswagen (16 inch)

FIGURE 2B.—70 Volkswagen front versus 70 Mercury Montego rear—centerline mismatch

FIGURE 3.—70 Chevrolet front versus 70 Chevelle rear—centerline mismatch

FIGURE 4.—69 Fairlane front versus 69 Plymouth rear—centerline mismatch

FIGURE 5A.—Variation in height of leading edge of face bar—left, 70 Chevrolet rear ($26\frac{1}{2}$ inch) ; right, 70 Ford front ($18\frac{1}{2}$ inch)

FIGURE 5B.—70 Ford versus 70 Chevrolet rear—corner mismatch

FIGURE 5C.—70 Chevrolet rear versus 70 Ford front—centerline mismatch

FIGURE 8.—70 Camaro front versus 70 Ambassador rear—centerline mismatch

FIGURE 7A.—Variation in height of leading edge of face bar—left, 70 Chevelle front (21 inch) ; right, 70 Chevelle rear (28 inch)

FIGURE 7B.—70 Chevelle rear versus 70 Chevrolet front—centerline mismatch

FIGURE 8.—70 Mustang front versus 70 Mustang rear—centerline mismatch

FIGURE 9.—70 Ford front versus 70 Plymouth rear—corner mismatch.

Senator STEVENS. Is this going to apply to foreign-manufactured cars brought into this country too?

Mr. TOMS. Absolutely.

Senator STEVENS. Have you consulted with the industry? Is it possible to tool up on both the protective bumper and on the height problem within that time frame?

Mr. TOMS. It is our belief that they can do this. I will be quick to concede that there will be some retooling requirements for some models and that will push the industry hard. However, we feel that it can be done.

Senator PASTORE. Are you actually saying—I don't know if I follow you correctly—that what you have in mind on this matching situation is that no matter what the make of the car it will be that many inches up from the ground so that bumpers will match when they come together? Is that what we are talking about here?

Mr. TOMS. Partly. The pendulum itself is designed so that it hits the bumper at many different locations and at different angles. It is also designed to indicate where the bumper of another car will strike at under different crash conditions.

If you take the approach of just measuring the distance between the ground and the bumper, loading characteristics become a real problem. Our engineers have decided that the pendulum device is the best engineering approach to assure bumper match.

Now, we did, Mr. Chairman, give some thought to the use of a ruler in measuring distance of the bumper from the ground, but we rejected this as not being as good as a pendulum test. A pendulum test also accomplishes some other things. The nature of the face and other surfaces of the pendulum prevent sheet metal and other parts of the vehicle body from overhanging the bumper so they would be damaged in a collision. It is difficult to develop an engineering technique that will fairly measure these things under all impact modes.

Senator PASTORE. Now, you are doing this as a safety measure?

Mr. TOMS. This is a safety measure, but we think for all practical purposes this will do the damage job also. And this is one of the reasons why we worked so hard on the pendulum and why we issued that caveat about further refinements when the rule first came out—is because we knew that the pendulum test was a complicated process and we needed more time to develop it.

I will even state a further caveat. I think as we do more pendulum testing we are probably going to be interested in changing the face again in the future and improving it.

The more you work with the pendulum, the more you realize the things that can be accomplished through its use.

At first, I personally didn't fully understand the pendulum and, not being an engineer, had a little trouble comprehending all of its uses.

However, now that I have seen more of this pendulum, I realize that it is going to be a very useful device.

Senator STEVENS. What is the requirement for 1973 models now?

Mr. TOMS. That the bumpers be able to pass the barrier test.

Senator STEVENS. The 5 and 2½?

Mr. TOMS. That is correct.

Senator STEVENS. And that requires retooling for 1973?

Mr. TOMS. It will require on the front that the manufacturer use some kind of energy management device or else they will have to adopt a kind of a frame and chassis that can absorb that impact. It will vary greatly from car to car, but it is still a fairly sizable blow, takes a lot of energy to be dissipated.

Senator STEVENS. It doesn't have any height requirement for 1973?

Mr. TOMS. No, there is not.

Senator STEVENS. So in 1973 you have the face to face, the height requirement, and you have increased the rear to 5?

Mr. TOMS. For 1974.

Senator STEVENS. For 1974—5 and 5?

Mr. TOMS. That is correct.

Senator STEVENS. I want to applaud you. Have you had any conversations with foreign car manufacturers?

Mr. TOMS. Yes.

Senator STEVENS. I see our State and the west coast flooded with Toyotas and the East flooded with Volkswagens. I don't see how they are going to get their face up to my wife's Oldsmobile.

Mr. TOMS. As in any program like this, there are real challenges before them. We think that they can do it. The real issues in this business are time and money. Know-how is obviously there.

Senator STEVENS. Don't misunderstand me. I would just as soon shut off the flow of all those things into this country. But are there restrictions? Are you proposing to keep them out if they don't meet the test? Is it just a consumer information concept?

Mr. TOMS. I will have my lawyer tell you how we will do that.

Mr. SCHNEIDER. If they don't comply with this standard, they won't be able to sell any cars in this country, Senator Stevens. We would get an injunction prohibiting them from doing it. We have authority to do this.

Senator STEVENS. You have the existing authority to prohibit importation of cars that are not safe?

Mr. SCHNEIDER. We have the authority to enjoin the importation or sale of vehicles that don't comply with an applicable safety standard. And the exterior protection standard would be an applicable safety standard.

Senator Cook. You also have the authority to stop any such automobiles that are already in the country from going on the highway?

Mr. SCHNEIDER. Yes, sir.

Senator Cook. In other words, prior to sale?

Mr. SCHNEIDER. Yes, sir.

Mr. TOMS. As a matter of fact, quite often we will impound a vehicle because it does not meet the safety standards, and we will hold it until it is brought up to the standard or it is sent back to the country of origin.

Senator Cook. May I give you a real loophole in this? I posed this at our previous hearing. Nothing in any of the legislation that is proposed, including S. 976, says anything to preclude the owner of the automobile from taking his bumper off, as we see done. We see many automobiles on the roads that are reworked, rear springs are put in, so that the automobile is another 2½ feet above the ground. This obviously represents the most tremendous mismatch in the world.

Senator STEVENS. Is this going to apply to foreign-manufactured cars brought into this country too?

Mr. TOMS. Absolutely.

Senator STEVENS. Have you consulted with the industry? Is it possible to tool up on both the protective bumper and on the height problem within that time frame?

Mr. TOMS. It is our belief that they can do this. I will be quick to concede that there will be some retooling requirements for some models and that will push the industry hard. However, we feel that it can be done.

Senator PASTORE. Are you actually saying—I don't know if I follow you correctly—that what you have in mind on this matching situation is that no matter what the make of the car it will be that many inches up from the ground so that bumpers will match when they come together? Is that what we are talking about here?

Mr. TOMS. Partly. The pendulum itself is designed so that it hits the bumper at many different locations and at different angles. It is also designed to indicate where the bumper of another car will strike at under different crash conditions.

If you take the approach of just measuring the distance between the ground and the bumper, loading characteristics become a real problem. Our engineers have decided that the pendulum device is the best engineering approach to assure bumper match.

Now, we did, Mr. Chairman, give some thought to the use of a ruler in measuring distance of the bumper from the ground, but we rejected this as not being as good as a pendulum test. A pendulum test also accomplishes some other things. The nature of the face and other surfaces of the pendulum prevent sheet metal and other parts of the vehicle body from overhanging the bumper so they would be damaged in a collision. It is difficult to develop an engineering technique that will fairly measure these things under all impact modes.

Senator PASTORE. Now, you are doing this as a safety measure?

Mr. TOMS. This is a safety measure, but we think for all practical purposes this will do the damage job also. And this is one of the reasons why we worked so hard on the pendulum and why we issued that caveat about further refinements when the rule first came out—is because we knew that the pendulum test was a complicated process and we needed more time to develop it.

I will even state a further caveat. I think as we do more pendulum testing we are probably going to be interested in changing the face again in the future and improving it.

The more you work with the pendulum, the more you realize the things that can be accomplished through its use.

At first, I personally didn't fully understand the pendulum and, not being an engineer, had a little trouble comprehending all of its uses.

However, now that I have seen more of this pendulum, I realize that it is going to be a very useful device.

Senator STEVENS. What is the requirement for 1973 models now?

Mr. TOMS. That the bumpers be able to pass the barrier test.

Senator STEVENS. The 5 and 2½?

Mr. TOMS. That is correct.

Senator STEVENS. And that requires retooling for 1973?

Mr. TOMS. It will require on the front that the manufacturer use some kind of energy management device or else they will have to adopt a kind of a frame and chassis that can absorb that impact. It will vary greatly from car to car, but it is still a fairly sizable blow, takes a lot of energy to be dissipated.

Senator STEVENS. It doesn't have any height requirement for 1973?

Mr. TOMS. No, there is not.

Senator STEVENS. So in 1973 you have the face to face, the height requirement, and you have increased the rear to 5?

Mr. TOMS. For 1974.

Senator STEVENS. For 1974—5 and 5?

Mr. TOMS. That is correct.

Senator STEVENS. I want to applaud you. Have you had any conversations with foreign car manufacturers?

Mr. TOMS. Yes.

Senator STEVENS. I see our State and the west coast flooded with Toyotas and the East flooded with Volkswagens. I don't see how they are going to get their face up to my wife's Oldsmobile.

Mr. TOMS. As in any program like this, there are real challenges before them. We think that they can do it. The real issues in this business are time and money. Know-how is obviously there.

Senator STEVENS. Don't misunderstand me. I would just as soon shut off the flow of all those things into this country. But are there restrictions? Are you proposing to keep them out if they don't meet the test? Is it just a consumer information concept?

Mr. TOMS. I will have my lawyer tell you how we will do that.

Mr. SCHNEIDER. If they don't comply with this standard, they won't be able to sell any cars in this country, Senator Stevens. We would get an injunction prohibiting them from doing it. We have authority to do this.

Senator STEVENS. You have the existing authority to prohibit importation of cars that are not safe?

Mr. SCHNEIDER. We have the authority to enjoin the importation or sale of vehicles that don't comply with an applicable safety standard. And the exterior protection standard would be an applicable safety standard.

Senator Cook. You also have the authority to stop any such automobiles that are already in the country from going on the highway?

Mr. SCHNEIDER. Yes, sir.

Senator Cook. In other words, prior to sale?

Mr. SCHNEIDER. Yes, sir.

Mr. TOMS. As a matter of fact, quite often we will impound a vehicle because it does not meet the safety standards, and we will hold it until it is brought up to the standard or it is sent back to the country of origin.

Senator Cook. May I give you a real loophole in this? I posed this at our previous hearing. Nothing in any of the legislation that is proposed, including S. 976, says anything to preclude the owner of the automobile from taking his bumper off, as we see done. We see many automobiles on the roads that are reworked, rear springs are put in, so that the automobile is another 2½ feet above the ground. This obviously represents the most tremendous mismatch in the world.

So, consequently, what we are doing is we are imposing tremendous restrictions on the manufacturer of automobiles to meet this standard, but nowhere in any of these do I read anything that imposes on the owner of that automobile the obligation to maintain the configuration of that automobile to comply with safety standards that are imposed upon the manufacturer.

Mr. TOMS. This is a State regulatory problem. We do have a vehicle inspection standard under our State and community program. There is no question that as we move forward in safety and in air pollution that we are going to have to get tougher.

Senator COOK. Do you think you need that authority?

Mr. TOMS. We have that authority now. We have the authority—

Senator COOK. I am not sure you do.

Mr. SCHNEIDER. Yes, we have it under the Highway Safety Act.

Mr. TOMS. However, we don't have the authority to prevent the individual from making the change.

Senator COOK. Yes, but you have the authority to impose a regulation and ask the States to impose it. Is it mandatory that the States impose it?

Mr. TOMS. We could withhold their money if they did not.

Senator PASTORE. Any further questions?

Senator STEVENS. I would like to ask one thing. You have the authority, do you not, to have Federal regulations that apply to Federal-aid highways, as far as utilization of those highways is concerned?

Mr. TOMS. Yes.

Senator STEVENS. You don't believe you have the authority to issue a regulation that says some of these people can't put 10-inch wheels in the front and 25-inch wheels in the back and thereby destroy the face-to-face concept very easily? You can't prohibit those cars from traveling on Federal systems?

Mr. TOMS. We can make determinations as to what the requirements for the vehicle inspection program are and set these forward to the States and bring pressure on the States to adopt them by withholding their money for not having a program that meets our standards.

We do not have the authority to enforce these laws directly against the consumer or the motor vehicle operator. The real pressure on the operator is that in a State which has these inspection programs he has to go in and get a sticker and renew his registration. If he goes in and gets his sticker and renews his registration and goes back out and takes his bumper off or puts the small wheels on, it becomes a police enforcement problem.

It is true that this is an issue. We have monitored once-a-year State inspection programs. We find that some vehicle owners bring their vehicle into condition to meet these requirements. Then they go back and they rake the vehicle by raising the rear end or by making other changes in the appearance of the vehicle so that they do not meet these standards. Sometimes they get away with it for a long time.

We feel that really safe cars on the roadway is truly an enforcement issue.

Vehicle inspection itself, alone, isn't enough to do the job. It is only a part of the program.

I would guess, Senator Stevens, that this is the kind of thing that is going to require a long-range kind of program. There are always

going to be people that have fierce beliefs about their individuality and their tastes in automobiles and will be attempting to do these kinds of things.

Senator PASTORE. May I ask a question at this point, Mr. Stevens?

I direct this to you, Mr. Toms, and to your attorney too. These standards that you will fix will have the effect of law, will they not?

Mr. TOMS. That is correct.

Mr. SCHNEIDER. Yes.

Senator PASTORE. The standard is directed towards the manufacturer, is it not?

Mr. SCHNEIDER. Yes.

Senator PASTORE. Your argument is that if an individual, once he gets his sticker, makes some alteration in his car, your standard does not run toward him? It is a police matter?

Mr. TOMS. Well, we do not in the Federal Government have that enforcement capability. In other words, we do not have the authority to be out on the street and find out that he has been making changes.

Senator PASTORE. I realize that, but the question I am leading to is this: In the event that a person does this deliberately just because he feels that is the way he would like to have his automobile and he has changed his car so it no longer complies with the standards that you have fixed and he is involved in an automobile accident, would that be considered contributory negligence?

Think about it and send us a note on it.

Senator STEVENS. Mr. Chairman, if I may, I was going just a little bit further than that. Why can't we establish a standard of conduct in this legislation that says that a person who modifies the face-to-face standard does have the civil responsibility for any damage that ensues?

(The following information was subsequently received for the record:)

U.S. DEPARTMENT OF TRANSPORTATION
NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION,
Washington, D.C., July 1, 1971.

HON. WARREN G. MAGNUSON,
Chairman, Committee on Commerce,
U.S. Senate,
Washington, D.C.

DEAR MR. CHAIRMAN: This is in response to the Senate Commerce Committee's request, made during its June 16 hearing on S. 976, for the National Highway Traffic Safety Administration's view on the question of whether the alteration of a motor vehicle so that it ceased to comply with all applicable Federal Motor Vehicle Safety Standards would constitute contributory negligence in the event of an accident. As the Committee recognized, this question must be considered under two different fact situations: first, with the absence of a statute prohibiting the alteration of Federally required safety features, and second, with the existence of such a statute.

In the absence of a statutory prohibition against the alteration of safety features, evidence of alteration performed prior to an accident would be admissible in connection with that accident, if at all, only for the purpose of reducing the amount of the plaintiff's recovery. Case law on the related question of the failure to use seat belts indicates that the States would be reluctant to admit such evidence. Many States would refuse admission of the evidence under any circumstances. In those States that would admit the evidence, there would be a requirement for an extremely strong showing that the presence of complying safety equipment would have reduced the damage or injury.

If such a statutory prohibition were adopted, most of the objections of State courts to the admission of the evidence would be eliminated. However, only in a few States does it appear probable that such evidence would establish negli-

gence *per se*. In most States, the evidence would be admitted for the purpose of simply reducing the damages sought by the plaintiff.

Please let me know if I can be of further assistance.

Sincerely,

LAWRENCE R. SCHNEIDER,
Acting Chief Counsel

Mr. Toms. I think, Senator, it would be possible for us to explore standards within our vehicle inspection program hoping that States would adopt them, like, for example, the helmet law in motorcycling. We have adopted this as a strong part of our State and community programs, and most States have adopted motorcycle helmets. It has been very tough to get people to wear these helmets.

We could probably pursue it along those lines in our State and community program and make it a violation of State law if they were to make these alterations.

Senator STEVENS. I am not communicating. Suppose my daughter takes my car out and she negligently backs into someone at the rate of 5 miles an hour, and that person has altered the back of their car so that face-to-face no longer meets, and she jams into his bumper. It doesn't hurt him at all and smashes the rear end of my car.

Now, she was negligent, but under the standards, if he had abided by the standards, there would be no damage.

I think we could establish a standard of conduct so that he would be responsible if he had altered his car and so that there would not be protection for the person who was negligent. But in a very minor way so that the damage that ensued would not have ensued if he had not modified his car. That is what I am talking about.

Senator PASTORE. That is *res ipsa loquitur*, isn't it? You may be going too far. Because the damage may be disconnected with the violation of the standard.

Senator STEVENS. That is a matter of proof.

Senator PASTORE. Maybe the daughter began to back up at 50 miles an hour.

Mr. SCHNEIDER. Mr. Chairman, there has been some discussion in the Department and with representatives of the various States as to the possibility of having State legislators adopt a law which would make it an offense, not necessarily a criminal offense, but an offense, to alter a vehicle so that it no longer complies with an applicable safety standard—for example, take the head restraint out or, if it had a bumper, as Senator Cook referred to, take the bumper off.

There is no doubt in my mind as a lawyer that the Congress could make it a Federal violation if it wanted to. But to try to enforce such a law at the Federal level would be extremely burdensome, I would think.

Senator PASTORE. Well, I hope we don't sit here as a supreme court.

Senator COOK. The answer to your question, Mr. Chairman, is going to be that I doubt seriously that you could impose a degree of negligence on him because he violated a national safety standard that is not, as a matter of fact, a violation of the law as such.

Senator PASTORE. But if it contributed—that is the point. This is the reason why I raise the question of contributory negligence. If his negligence contributed to the damage that was caused, you see, he

would be without relief. But if it didn't contribute, I mean then, of course, it would be another case, and that is for the court to decide.

Senator STEVENS. But it is not negligence unless we establish a standard of conduct.

Senator COOK. That is right. It is not a matter of contributory negligence, unless you establish it as an item of negligence.

Mr. SCHNEIDER. I don't think it is per se contributory negligence. I think—

Senator PASTORE. I didn't say it is per se. All I am saying—

Mr. SCHNEIDER. No.

Senator PASTORE. All I am saying is this: If a person deliberately on his own changed a car in violation of the standard—and that is the reason why I asked you if the standard had the effect of law. Where you have deliberately violated the law in changing something, and that change in violation contributes to an accident, you are responsible. That is basic law, isn't it?

Mr. SCHNEIDER. I would support your position.

Senator PASTORE. I studied a little bit of law, too.

Senator STEVENS. Mr. Chairman, I am sure you are a good lawyer. But I just want to say this. I agree with Senator Cook in that I don't see anything here that imposes this standard on the individual.

Senator PASTORE. No, I am not saying that.

Senator STEVENS. It imposes it on the manufacturer. In what instances are you going to carry this over and say the individual can't modify that standard?

Mr. TOMS. We will have to do it through our State and community program.

Senator STEVENS. Why don't you do it through this bill?

Senator PASTORE. It might be a good idea to say that anyone who deliberately changes the standard becomes responsible under the law for having done it.

Senator COOK. I have a notion, Mr. Chairman, the best way to do it, if you are going to do it in this act, is to have a section in here which gives the States a required period of time to impose these same safety regulations on the driver that you have imposed on the manufacturer, and tell the State that if they do not pass such legislation within a required period of time, then DOT funds in these programs will be cut off.

And I think this is the only way. If you are going to do this and you are going to do it from a degree of enforceability, you have to give the States the authority; and the only way you can do that, it seems to me, without having it a Federal offense—and I agree that I have no idea how in the world you are going to enforce this—is to say to the respective States that the safety standards as imposed on manufacturers shall be imposed on the consumer, and he shall not alter or change his automobile once it fulfills those requirements.

And if the States do not create such legislation within a reasonable period of time, which you ought to set out in the legislation, then the DOT funds will be withheld.

Senator PASTORE. You have that latitude under presently existing law directed toward the individual?

Mr. SCHNEIDER. I don't think we have authority to do that. However we have authority, Mr. Chairman, to develop model legislation

under our State and community programs and say to the States, "You have to adopt it." The only sanction we can apply if they don't adopt it is to withhold their highway safety money and recommend to the Secretary that he withhold up to 10 percent of their Federal aid money.

Senator PASTORE. Then Mr. Stevens has a very good point.

Mr. TOMS. Yes.

Senator PASTORE. The only remedy here is to withhold money, isn't it?

Mr. SCHNEIDER. Yes.

Senator STEVENS. Mr. Chairman, there is another thing I would like to mention. I think if there is a "carrot and stick" approach, it ought to be in the law, not in the regulations. I think everyone ought to realize it is coming. It might be well for us to consider putting it in this bill.

Senator COOK. I think that is the only way you are going to advise the public.

Senator STEVENS. May I pursue another matter, Mr. Chairman?

Senator PASTORE. Yes, you may. Would you mind if I asked a few questions first, and then I would ask Mr. Cook to take over the hearing, if he will.

Senator STEVENS. Not at all.

Senator PASTORE. These have been prepared.

And I would hope too that whoever takes the chair will allow the counsel here to ask a few questions that he has prepared.

Are you saying then that the higher performance standards that you are setting will eliminate much of the damage to the vehicle?

Mr. TOMS. Yes.

Senator PASTORE. Will the new standard spell out in detail how the passenger as well as the vehicle will be protected in low-speed crashes?

Mr. TOMS. Not in standard 215. We will do this in standard 208 and other standards where we deal with interior occupant protection.

Senator PASTORE. As you promised in the previous hearing, will you begin providing this committee on a regular basis information as to the cost of the safety improvements mandated by the 1966 auto safety law?

Mr. TOMS. Yes. As a matter of fact, we are in good position to get started immediately.

Senator PASTORE. When can we expect the first submission?

Mr. TOMS. I would hope very, very shortly.

Senator PASTORE. All right. Is it true that the administration proposes to supply consumer information about the damageability characteristics of vehicles in order to stimulate better design of cars?

Mr. TOMS. Yes.

Senator PASTORE. Is it true that efforts of your agency to date to move Detroit to more effective action in the safety area by publishing consumer information have proved an utter failure?

Mr. TOMS. I hate to use "utter."

Senator PASTORE. All right. I will take the word "utter" out. Have proved to be a failure? A failure is a failure no matter how big it is.

Mr. TOMS. We have been very dissatisfied with our progress in this area, and we—

Senator PASTORE. Can you give us an explanation for it?

Mr. TOMS. Well, No. 1, we have been pursuing this program through dealer showroom, and it just hasn't worked. Dealers that have information from us that shows that their car does not perform well often work very hard to prevent the consumer from getting this information.

We only issue information about three aspects of vehicle performance. This is really not enough. We have to broaden our information program.

It is my personal hope that we can go on television, that we can provide information to automobile consumer magazines, that we can work more directly with the media. In these ways, we can try to get this message widely disseminated so that the consumer will see it rather than expecting him to get it in the dealer's showroom.

Senator PASTORE. Well, don't you think that dealers already know pretty much the information? It is the idea that there is no penalty; isn't that it? Is there a penalty?

Mr. TOMS. Not only is there no penalty, but you really, I guess, can't expect them to say bad things about the car they are trying to sell.

Senator PASTORE. Well, that isn't that point. That is right, too. On the other hand, if they have to bring it up, I suppose he would have to do it at his own cost, wouldn't he? And if the next dealer selling the same kind of automobile didn't do it, he is in a better position to give the consumer a bargain, and the consumer many times doesn't even know the difference between the two.

Mr. TOMS. I think the best way is through your consumer magazines and by trying to get it on public service time on radio and television.

Senator PASTORE. Thank you very much.

Will you take over, Senator Cook? I will have to go.

Mr. TOMS. Thank you, Mr. Chairman.

Senator COOK. Mr. Chairman, I have concluded. The only thing I wanted to do was put something in the record if I might. A request has been made by the Secretary, which is included in their 1972 budget, for the sum of \$9,600,000 for the test facilities which were required of the Department pursuant to 91-265, which said any appropriation in excess of \$100,000 had to be approved by the respective committees.

If there is no objection, I would like to put the letter of Mr. Volpe requesting the funds and the prospectus for the proposed construction of the facility into the record.

(The information follows:)

THE SECRETARY OF TRANSPORTATION,
Washington, D.C., June 8, 1971.

HON. SPIRO T. AGNEW,
President of the Senate,
Washington, D.C.

DEAR MR. PRESIDENT: The purpose of this letter is to request that the Congress authorize appropriations in the amount of \$9,600,000 for the design, construction and equipping of a Compliance Test Facility. A prospectus for the proposed facility is enclosed as required by Public Law 91-265, dated May 22, 1970. Amendment to National Traffic and Motor Vehicle Safety Act of 1966. Title III Research and Test Facilities, Section 301.

The National Highway Traffic Safety Administration requires the Compliance Test Facility to provide the capability for testing motor vehicles, tires and other motor vehicle equipment in order to demonstrate manufacturers' compliance with the Federal Motor Vehicle Safety Standards and to investigate for possible safety related defects. The need for such a facility was set forth in our October

1968 report to the Congress on facility requirements and was discussed in some detail during the hearings on the proposed Fiscal Years 1970 and 1971 Authorization Bill. Budgetary considerations, however, precluded a prior request for appropriations. The Department's Fiscal Year 1972 Budget request does include a project for the Compliance Test Facility.

Sincerely,

JOHN A. VOLPE

Enclosure.

PROSPECTUS FOR PROPOSED CONSTRUCTION UNDER THE NATIONAL TRAFFIC AND MOTOR VEHICLE SAFETY ACT OF 1966

Project titles.—Compliance test facility.

Project location.—Ohio Highway Transportation Research Center, East Liberty, Ohio.

Project objective.—To provide the National Highway Traffic Safety Administration (NHTSA) with a capability to perform a variety of tests on motor vehicles, tires and other motor vehicle equipment in order to: verify manufacturer's compliance with the Federal Motor Vehicle Safety Standards; evaluate the technical sufficiency of corrective actions specified by the manufacturers in their safety-related recall campaigns; investigate consumer reports or other indications of serious safety defects; and evaluate test procedures and requirements specified for proposed Federal Motor Vehicle Safety Standards.

Estimated maximum project cost.—Design, \$400,000; construction, \$4,500,000; equipment, \$4,700,000 for a total estimated maximum cost of \$9,600,000.

The Department of Transportation will be the primary user of the Compliance Test Facility, therefore, no other agency public or private will contribute to the cost.

Project description.—The project will provide for the design, construction and equipping by FY 1974, of a new government facility consisting of the following functional elements:

Testing Laboratory of approximately 58,000 S.F. including areas for inspecting, preparing and instrumenting vehicles; routine and specialized testing of vehicles and equipment including environmental, photometric, static and dynamic load and materials testing; and tire testing.

Straight test roadway approximately 3,200 feet long, crash barrier and skid pad.

Administrative and technical support area of approximately 26,000 S.F. including calibration laboratory and a data storage and retrieval area.

Support Service Area including a 12,000 S.F. warehouse and a 1,000 S.F. service station.

Project justification.—The Compliance Test Facility must be provided to support compliance and other testing related to motor vehicle safety. This testing will assist in determining whether vehicles and equipment sold in the U.S. do in fact conform with the Standards and thereby contain the necessary safety protection. Defects analysis which includes the testing of vehicles and equipment will be conducted to develop evidence of possible safety related defects and to evaluate the actions taken by manufacturers to correct such defects. Testing associated with the development of test procedures and requirements for proposed Standards will also be conducted in this facility. The effectiveness of the motor vehicle safety programs as a regulatory function, depends in major measure on this corroborative and investigative testing of motor vehicles and equipment.

In the absence of Government facilities, the required testing is being conducted under contract by private testing laboratories. However, continued complete dependence on private laboratories is not satisfactory. There are an inadequate number of laboratories qualified to do the required testing, all of which have other clients. Even for the current partial program which is within the capacity of these laboratories, delays and problems are experienced in scheduling tests and in carrying out a timely program. These private laboratories are not geared to conducting the full range of compliance tests required by NHTSA; therefore several laboratories must be contracted to accomplish the work. In many cases makeshift arrangements must be used and test items must be transported between laboratories in order for the items to be tested to more than one Standard.

Inherent in competitive contract program are the long lead times associated with selecting qualified laboratories to conduct particular tests and negotiating contracts, as well as the lack of control and flexibility for quick reaction to unpredictable testing, required to investigate a safety defect or special non-compliance problem. The private laboratories also do business with segments of the automotive industry, with the resultant potential conflicts of interest. Private laboratories will continue to be used to augment the capability of the government facility when workloads exceed the test capacity of the Compliance Test Facility and when testing is required in areas where no test capability has been provided due to cost-ineffectiveness.

The magnitude of the compliance test program is almost unbounded considering the number of Federal Vehicle Safety Standards together with the universe of vehicles and replacement parts that must be brought under surveillance for compliance with these standards. Currently there are thirty Federal Motor Vehicle Safety Standards in effect, and approximately 115 rulemaking actions in process which will result in new standards and amendments to extend the scope or upgrade existing standards. The standards reflect performance or demonstration requirements described in the form of various types of test which must be conducted to determine whether the standard has been met. The types of tests include: visual inspection, physical measurement, environmental, laboratory destructive, laboratory non-destructive, performance under simulated and actual conditions, and crash. The effectiveness of this program can be illustrated in the test results gathered since the program was initiated. These results indicate the failure rate for vehicle testing is 16.2 percent and equipment testing is 7.8 percent.

Defects analysis involves the systematic engineering analysis of various sources of information including laboratory testing of suspect components and systems. As a result of activities in this area, NHTSA has been responsible for thirty safety defect recall campaigns which would otherwise not have been initiated. Testing plays a major role in defect analysis and has produced significant data involving such items as:

GM-Kelsey Hayes three piece wheels which failed on $\frac{3}{4}$ ton pick-up trucks modified as campers.

Firestone wheel rims which experienced catastrophic failure on vehicles.

Ford (1969) front suspension, lower control arm which cracked on police vehicles.

Ford (Mustang) front suspension lower strut which experienced failures.

Approximately 671 manufacturers' safety-related defect recall campaigns, involving more than 15 million vehicles, have been conducted from the start of the program to December 1970. This illustrates the potential testing effort related to evaluating the technical adequacy of manufacturers' corrective actions.

The development and evaluation of test procedures and requirements for proposed Standards must be accomplished by means of extensive laboratory test evaluations. For each Standard requiring a demonstration or performance test, a test procedure must be developed which will give reliable vehicle test data from the standpoint of reproducibility, will be meaningful relative to the proposed Standard, and will be applicable on an industry wide basis. The Compliance Test Facility will provide the test capability necessary to conduct this activity.

The facility concept proposed for the Compliance Test Facility is based on detailed engineering studies. These studies include a systematic analysis of the test requirements for current and proposed Federal Motor Vehicle Safety Standards and the characteristics and magnitude of vehicles and equipment manufactured each year. From this analysis an estimated average annual test workload has been derived. The data indicates that the average workload will consist of 1300 full vehicle tests involving approximately 170 new vehicles, 1150 vehicle component tests and 5,000 tire tests. This does not include the test requirements for safety-related defects analysis, since these requirements cannot be accurately predicted. The space, equipment, and manpower requirements, and cost estimates reflected in this prospectus have been translated from the estimated annual test workload data.

The engineering studies have also established the Architect-Engineer design criteria which will be used as the basis for final design. Therefore final design can be initiated as soon as project funds are made available.

ESTIMATED TOTAL ANNUAL COSTS AND PERSONNEL REQUIREMENTS

| Costs | Fiscal year— | | | | |
|--------------------------------|--------------|---------|---------|---------|---------|
| | 1972 | 1973 | 1974 | 1975 | 1976 |
| Design..... | \$400 | | | | |
| Construction..... | 4,500 | | | | |

Senator STEVENS. Where are we going after 1974?

Mr. TOMS. I think that after 1974 we will be monitoring very carefully the effectiveness of the pendulum test and our barrier requirements for the purpose of determining what further changes are necessary. I am convinced that there will be continually improvements in the quality of the standard.

Senator STEVENS. Obviously the cost of this tooling up or retooling is going to be passed on to the consumer. There has to be retooling for the 1973 models which is entirely different than retooling for 1974, as I understand it. I am not knowledgeable enough on the subject. Are we going to reach a point where these things are going to get caught up so that we do not have retooling costs every year?

Mr. TOMS. I think that your biggest change for 1974 will come on rear bumpers, and I think that after that change is made, what changes from that point forward there are will be largely dependent upon what we learn in our experimental safety vehicle program.

I might add that we do have energy managing 10-mile-an-hour bumpers on our ESV cars, and what we learn there and what our practical experience has been in advising the consumers of the damage that has been suffered and the safety systems that have been damaged will lead us to whatever changes appear to be necessary in future regulations.

Senator STEVENS. You can consult Mr. Schneider on this. But I would like to ask you a series of questions.

Don't your existing regulations and the law require the dealer to disclose to a prospective purchaser any defects or safety information or any information that you have provided? Don't they require him to disclose them in the showroom?

Mr. TOMS. I don't think so.

Mr. SCHNEIDER. Senator Stevens, the present law requires the manufacturer to, through his dealers, make the consumer information available to purchasers of vehicles and prospective purchasers.

Insofar as defects are concerned, it is the manufacturer's obligation to notify the consumer by certified mail of the existence of the defect.

Senator STEVENS. That is another matter. I went too far in mentioning defects. Let's go back. You have a statutory requirement that the manufacturer through his dealer must disclose certain consumer information? Right?

Mr. Toms. Correct.

Mr. SCHNEIDER. Yes, sir.

Senator STEVENS. Do you have any information that the manufacturers have not sent such consumer information to the dealers?

Mr. Toms. No. We have monitored this, and we have actually taken some surveys, and we find the real problem is in the dealer's showroom.

Senator STEVENS. What is in the existing law or regulation that puts the burden on the dealer as opposed to the manufacturer? The dealer is the one that is in contact with the consumer. And you are saying to us that this dealer is using devices so that he does not have to carry out the intent of Congress and the administration in disclosing consumer information to a prospective purchaser? Is that correct?

Mr. Toms. That is correct. We have seriously considered what kind of authority would be required to force the dealers to do a job in this area.

The dealers have come in and have protested strongly against this and encouraged us to seek other ways. And I can see their point. You know, this does hurt them in the marketplace. If a car that they are handling, for which they have a franchise, is not doing well, it really kind of rubs salt in the wound to make them tell the consumer about it when he comes in to buy the car.

Senator COOK. Particularly after they already have it from the manufacturer and they have a big note at the bank on the cars that they have sitting out on the lot.

The unfortunate part about this—and I think I might add just slightly to it, Senator Stevens—is that I think at the present time the only requirement which is totally negative in nature is that the dealer is required to give such information if it is requested of him.

Well, unfortunately, I really don't think that the purchaser pays that much attention, frankly, to the respective models and to the respective safety features of automobiles that he would go into a dealership and say, "Now, I am requesting of you to tell me if there are any basic defects or any problems with this automobile."

This in itself is an entirely negative approach. And I agree with you I think it puts a tremendous burden on the dealer who really is an independent contractor, who has, frankly, more automobiles out on the lot, of a particular model than he might be able to sell, but the financial consequences of that have already been satisfied to the manufacturer.

Mr. Toms. I still feel the best way to do this job is to go before the public in the magazines, the newspapers, radio, and television. We find there is a great deal of interest particularly in consumer magazines, as to this kind of information issued by the Government.

The full degree of effectiveness will have to wait until it is in operation. But there is no question that we will probably do a far better job going onto television and radio than we have so far in dealers' showrooms.

Senator STEVENS. I had a very interesting exchange here one day that produced a bit of notoriety for the gentleman. It seems to me that what you are saying is that there is another level of responsibility that we have not insisted upon, which is in the showroom. I wonder why you don't impose the responsibility at the place where the consumer has the direct contact.

Mr. TOMS. We would be very pleased, Senator, to explore this and work on it and see how this could be effectively done.

Senator STEVENS. I don't want to offend my friend here, although I wasn't here at the time, I recall the tremendous battle over labeling a certain brand of product that people smoke that comes from his State. And we required a warning on the packages. And it doesn't seem to make much difference to anybody.

I am not sure that even requiring the manufacturer to put a warning on the window or put consumer information on the window would be sufficient.

I think the question really is whether there is deception in dealing with consumers, whether a person who has the information knowingly and willfully withholds it and therefore leads the consumer to a purchasing decision with insufficient facts, without the full facts—or on the basis of untrue facts.

This leads me to question why there isn't a criminal penalty in this bill? Although you have a civil penalty, no criminal penalty is included. You have authority for civil injunction, yet you have no criminal penalty in the bill. Why?

Mr. SCHNEIDER. Senator Stevens, if I may respond to that, our bill as well as S. 976 are proposed amendments to the Traffic Safety Act of 1966. At that time, there was extensive discussion as to whether or not there should be criminal sanctions against manufacturers.

I recall, having studied the legislative history often on this in connection with my work, that Senator Pastore made a very eloquent speech on the floor of the Senate during the debates before passage of the Traffic Safety Act where he opted for civil penalties and other types of civil sanction.

Senator Pastore said that when you are dealing with the vehicle manufacturers, you are not dealing with people who really act with willfulness and intent to deceive. You are not dealing with the common type of criminal. And, therefore, you should not have criminal sanctions available.

Let me speak from our experience with civil penalty authority and our injunction authority. I personally don't think we would need criminal penalty authority to achieve what we would want to achieve insofar as getting manufacturer cooperation and compliance. I really don't personally believe it.

Senator STEVENS. I wasn't addressing myself to manufacturers. I was addressing myself to the guy in the showroom. You have adopted the philosophy that the marketplace is going to determine consumer acceptance of a new model. And that if we provide the consumer with all the information concerning the outcome of the testing and damage susceptibility and crashworthiness and so forth that he will make an informed judgment. Isn't that right regarding your policy?

Mr. TOMS. Yes.

Senator STEVENS. But we haven't done a thing to insure that he gets it, have we?

Mr. TOMS. Well, we have —

Senator STEVENS. The manufacturer is not going to give it to him. It has got to come from the dealer.

Mr. TOMS. Well, of course, we feel that the best way to disseminate this, Senator Stevens, is through your magazines, through television,

public service time, on radio, and try to make it broadly available to the people who normally distribute it and print it, and not rely on the dealer whatsoever.

Senator STEVENS. I see. Have you done that so far?

Mr. TOMS. We have done this on safety messages, and we feel with good results. We have begun to explore consumer information along this line. Our new Consumer Office is now gearing up. We hope that we will be successful in our consumer information program.

Senator STEVENS. On page 3 of your bill, subsection (d), the Secretary is authorized to conduct a contract for such research and testing as he deems necessary to carry out the purpose of this section, including but not limited to the acquisition and crash testing of passenger cars.

We received testimony from a gentleman from Cornell University, who suggested the United States have a modular system for testing. Is that possible under your subsection (d)? Are you looking into the concept of modular testing as opposed to testing each individual model of cars?

Mr. TOMS. We would look for both ways to see which is best and which is most efficient. There are certain parts of the automobile where the subsystem can be very effectively tested. However, there are other types of testing; for example, in handling, where you have to test the whole vehicle.

I think in some areas you can actually mathematically model with real efficiency, and there are other areas in which you cannot. It varies from car to car. This is part of the complexity of this kind of a program.

Senator STEVENS. Suddenly, it has been decided to test these cars after they have been going down the assembly lines. You don't have anything to test until the assembly line is put into motion and something comes off the end. Then you take a few cars, and the industry takes a few cars, and the insurance companies take a few cars, and they start testing them.

I am concerned about the people who are working along the assembly line. What happens to them during the period of testing? And what happens if you decide that the damage susceptibility or the crash-worthiness is not good?

Isn't there going to be a disruption of the labor market in the automobile industry if some system isn't established to try to figure these things out in advance? As Miller was saying, as I understand it, it is possible to work these things out in advance through modular system of testing.

Mr. TOMS. There is no question the manufacturer has to completely test his prototypes to be sure they meet the standards. Then you must rely on warranties and guarantees to be sure that the quality of the assembly line is sufficient to make those cars continue to meet these standards.

Senator STEVENS. I see.

Senator COOK. After I get through asking you this question, I am going to ask you one more, and that is I would like you to put into the record within the framework of your testimony today your opposition to S. 976 in regard to what you have discussed this morning. Don't you think you need authority here that the manufacturer has to make

available to your testing facilities in relation to these standards, new designs before they become a manufacturing item on a large-scale basis?

Mr. Toms. Senator Cook, this would be very, very helpful to us. I think—

Senator Cook. Would you want such authority?

Mr. Toms. The question that is running through my mind is whether the Government—whether we are ever going to have the capability of testing every make and model. This would mean that we would receive in excess of 500 cars sometime between April and July of the year in which each model would be introduced.

That is a big job. And to do a full-scale testing on all of those—I think I would prefer to put the burden on the manufacturer.

Senator Cook. Well, if you are only talking about 500 automobiles, really, Mr. Toms, I don't see this as being a gigantic job. You know, the Internal Revenue Department gets a few million tax returns starting on the 15th day of April, and they audit a whale of a lot more than 500 within 2 months, I will tell you.

Mr. Toms. That is true; but when we talk about 500 makes and models, we will probably have to destroy five or six of each make or each model, and we would have to have several others for the various kinds of handling and other testing that goes on. And the physical capability of the United States to crash that many cars in such a short period of time is presently not available.

Senator Cook. Well, I understand that it is not available, but I think that there are many ways that this could be approached.

First, it could be approached in relation to the request that you made for your testing center of almost \$10 million.

Then I think it could be approached on the basis of close cooperation under the law, between the manufacturer and the Department of Transportation, to do it onsite at his own facilities, that he meet certain testing standards, that he meet the type of testing standards—

Mr. Toms. That would be wonderful.

Senator Cook (continuing). That you are going to have in your own facilities. And it merely takes a team from the Department of Transportation to work in cooperation with the manufacturer at his own onsite facilities.

Mr. Toms. We have been monitoring their work to certify their product is to our standards. We have found this to be successful. At no time have we gone into manufacturers' facilities and asked for this information and felt that we were deceived. They have been very good about that.

Senator STEVENS. Could I ask one other question following up on that? Section (e) is quite interesting on page 3. It authorizes you to sell the crash-tested passenger cars as long as you inform the purchaser they have been crash tested. Are you contemplating selling those for stock car races or to go on the highway?

Senator Cook. If they are 5-mile-an-hour test vehicles, ultimately they are not going to do a great deal of damage, and I don't see why they should have to maintain and keep these.

That is like the law in my State that says if you sell a taxicab you have to give notice it was utilized as a taxicab. All you are saying is this was used by the Government as a testing vehicle, and obviously by

looking at it you could tell that very little damage was done to it in a 5 and 5 or 10 and 10 or whatever the case may be.

Senator STEVENS. Senator Cannon has come in.

Senator COOK. Senator Cannon.

Senator CANNON. I have no questions.

Senator COOK. Counsel has some questions.

Mr. SUTCLIFFE. Mr. Toms, there is one question that I think on the basis of the statement that you have presented on May 28 and your statement today should be asked for the record at this point.

You have argued that the authority granted in S. 976 to set property loss reduction standards could interfere with the safety mission of the National Highway Traffic Safety Administration. Is that correct?

Mr. TOMS. Yes, it is correct. I don't know whether "interfere" is the word. It is the matter of resources and capability and getting them to intermix.

Mr. SUTCLIFFE. So that the interference, if we can use that word, is based upon the possibility of restriction of resources?

Mr. TOMS. Yes, plus there are some philosophical concerns as to whether the Government ought to be in this business.

Mr. SUTCLIFFE. Now, to avoid this, you propose as an alternative the promulgation of consumer information to alert the public to the characteristics of vehicles so that the public in making their choices of vehicles would choose those which are the safest and which have the lowest aspect of property damage susceptibility?

Mr. TOMS. And we further feel that as this information is compelled to be set forth, the manufacturers are going to want to be sure that their cars are in the best possible framework or light before the public.

Mr. SUTCLIFFE. Now, given that presentation, you then come back in your testimony today and tell us—

We have determined that publishing a regulation for consumer information, with an objective test procedure, is just as difficult and time-consuming as issuing a safety standard.

How are we in any way, shape, or form saving resources and not interfering with the safety mission any more than if we gave you authority to set property loss reduction standards?

Mr. TOMS. The difficulty particularly in lateral crashes and quarter-panel crashes and this sort of thing of measuring exactly what that is is in much sense of the word a structure issue, and it gets into so many details that it is every bit as tough. In fact, it might even be tougher to try to promulgate property damage requirements rather than safety requirements.

Mr. SUTCLIFFE. Well, but—

Mr. TOMS. We often have to repair our cars considerably before they are resold, and generally the bidders know that they are DOT cars, and they are often not as bad as police vehicles that are being sold that have 80,000 or 90,000 and 100,000 miles on them.

Mr. SCHNEIDER. Or we will scrap them.

Senator STEVENS. Supposing I am a dealer and I hear you are going to sell 500 cars. I make a bid and I get 500 cars. Where is it provided that I must tell the prospective purchaser that they were crash-tested?

According to your idea, all you have to do is tell the people that buy them from you that they have been crash-tested. How about the consumer that we are supposed to think about?

Mr. TOMS. You are concerned about the dealer that purchases them at auction that way and attempts to resell them?

Senator STEVENS. You are not going to sell them to individuals. You are not going to set up a showroom, are you?

Mr. TOMS. No. It is a good point.

Mr. SCHNEIDER. Excuse me, Mr. Toms. We would label the cars or require that the cars be labeled in such a way that all subsequent purchasers would be aware that the car was crash-tested. I might add that if we run a car into a wall at 30 or 40 miles an hour we are not going to resell it. We would sell it for scrap.

Senator STEVENS. Thank you very much.

Senator COOK. Now, if I could have the collective judgment of the panel of your opposition to S. 976 in relation to your testimony this morning?

Mr. TOMS. Do you wish us to give it verbally or in writing.

Senator COOK. If you wish to do it section by section and put it in the record, that is all right with me.

Mr. TOMS. Yes. That would be best.¹

Senator COOK. All right.

Mr. TOMS. And we feel that if we can use insurance company information that actually indicates what the practical experience of a make or model has been in crashes and its involvement and what the claims have been, and we can then compare this against our crash testing information, that we can make excellent information available to the public.

We feel that this approach probably will work as well as anything. It would much less tap our resources than if we were to attempt to do both the structure crash work and the property damage work.

Mr. SUTCLIFFE. I missed the explanation. Because you first argue that setting of the safety standards and setting of objective test criteria for property loss reduction require the same resources from your agency.

Mr. TOMS. The same—it is the same level of difficulty of effort.

Mr. SUTCLIFFE. Which translates into the same resources.

Mr. TOMS. It has to use the same kinds of structure engineers.

Mr. SUTCLIFFE. So that we have a significant cost to the Government in promulgating effective consumer information.

Mr. TOMS. This is why, Mr. Sutcliffe, we felt that the best approach is to inform the consumer as to what is the best car for him to buy. And most people, which is one of the problems that we face, ask, "What car should I buy?" And, of course, we have to come back and ask, "What do you need?" Well, when you try to dictate what people ought to buy or what is good for them, this gets to be very complex. We can do that in safety, but in terms of personal taste it is difficult.

Then you multiply that by attempting to make judgments in terms of property damage. We know how tough it is to make these judgments in terms of safety. It gets to be a very difficult problem.

We prefer very much in this first go-around to try our best to employ information that is presently available in accident records and insurance files and let the consumer know rather than attempt to solve the problem from a structure viewpoint and deal with property damage rules.

¹ See page 1896.

Mr. SUTCLIFFE. How many makes and models of vehicles are presently, roughly, in existence?

Mr. TOMS. Over 500. Maybe 550 plus.

Mr. SUTCLIFFE. How are you going to get the comparison of information through radio and TV to the consumer about those 500 makes and models?

Mr. TOMS. We can't really communicate information on all 550. We are going to have to deal with those that are most popular. Of course, we will provide listings that people could refer to if they wanted to.

I think that the automobile enthusiast magazines might do this. They list in their issues all the vital statistics of every car by type of engine, wheelbase, weight, drive ratio, and this sort of thing. We think that they will pick this information up and make it available to the consumer.

The person who really wants to compare cars can go to a newsstand today and he can buy magazines that completely breakdown model, make, by cost, wholesale cost. He can even buy the costs at auction.

We think these kind of magazines will become available when the Government makes this information available.

Now, it is true that a lot of consumers wouldn't go to the trouble to try to find out that kind of information, but it will be available. We in the Government would be publishing these lists so that any magazine or any news service would have it available to present to the public.

Senator STEVENS. I think he has got quite a point, especially in light of a situation that recently occurred in my State. I will not mention the manufacturer. But brand A had a defective model, consequently, with all of the models, the sales fell off absolutely within that manufacturer's line of cars because of the notoriety over the one.

I think that the information that you have pertaining to a particular model will flow around all of the models of the same manufacturer for that year. They have a real risk in the marketplace if you have got any effective information about even one model of a line.

Mr. TOMS. It is our experience that when we declare a defect on an automobile there is a direct effect on sales. We find that the auto industry is enormously sensitive to this sort of thing and very responsive because they do fear that they will be hit in the pocketbook.

Senator COOK. I think the presumption is that when you have a particular bad model, it reflects on all the models that are manufactured by that manufacturer.

Mr. TOMS. It hurts the manufacturer enormously. So this can be an effective tool in doing the job, we feel. And we feel that it will enable us in the Government to do the best job, particularly in continuing with our ESV program, structure, handling.

Mr. SUTCLIFFE. Senator Cook, I think we could submit questions for the record for the remainder.

Senator COOK. Fine. Without objection, questions will be submitted to the Department for answers and made part of the record.

Thank you, gentlemen.

(The following information was subsequently received for the record:)

Sec. 2. Purpose

Amends the 1966 Act to establish procedures for setting minimum property loss reduction standards (including test procedures), and to promote competition among manufacturers in the production of vehicles that are less susceptible to damage and which lessen the risk of injury and death to occupants.

Provides for augmentation and implementation of certain Highway Safety Standards.

Calls for reduction in the extent of property damage and economic losses that result from motor vehicle accidents.

We agree with the overall purpose of S. 976 as stated in this section with only one exception—we do not agree with the provision which requires the setting of minimum property loss reduction standards. A discussion of our objections to this provision is included with our comments on Section 5 of the bill under Section 125 of Title I of the Act.

Sec. 3. Definitions

Definitions added include:

"Property loss reduction"

"Property loss reduction standards"

"Make"

"Model"

"Passenger motor vehicle"

We have no objections to these definitions. We must emphasize for clarification that our understanding of the term "passenger motor vehicles" as defined in S. 976 would include the following classes of vehicles which have been established for safety standards purposes: passenger cars, multipurpose passenger vehicles and buses. We would appreciate confirmation of our understanding such that enactment of this definition would not override or necessitate change of our classification of vehicles for safety standards purposes.

Sec. 4. Property loss reduction standards

All sections of the Act following section 102 (except 103(h)—time of issuance and 103(g)—dual standards) will add property loss reduction standards authority in addition to the present authority for motor vehicle safety standards.

We object to the requirement of property loss reduction standards authority. A detailed discussion of our objections is included in our comments on Section 5 of the bill under Section 125 of Title I of the Act.

Sec. 5. Public Disclosure of Comparative Safety and Susceptibility to Damage of Particular Motor Vehicles and Additional Standards**125 (a)**

Secretary shall issue regulations by July 1, 1972, on tests and test procedures to allow for comparisons of vehicle damage susceptibility at collision speeds including 5, 10, and 15 mph.

125 (b)

Secretary shall promulgate property loss reduction standards as soon as possible after July 1, 1972.

125 (c)

Secretary shall promulgate, as soon as practicable after July 1, 1972, a standard requiring all motor vehicles manufactured after January 1, 1975 to be equipped with 5 mph energy absorbing front and rear bumpers that would enable the vehicles to withstand 5 mph impact with minimum damageability.

125 (d)

(1) Secretary shall make a study of the feasibility of developing tests and test procedures for comparison of risk of personal injury or death to motor vehicle occupants and report to President and Congress by July 1, 1972.

(2) If tests are feasible, the Secretary will issue regulations on the test and testing procedures as soon as practicable.

125 (a)

We are opposed to the issuance of regulations specifying vehicle damage susceptibility tests and test procedures. The requirement that vehicles be tested in accordance with these procedures would impose undue burdens upon the manufacturers. The manufacturers would be required to conduct a large number of prohibitively expensive tests each year in order to comply with this section.

There are currently approximately 500 different makes and models of vehicles that would be subject to the requirements for conducting annual damage susceptibility tests. In order to obtain statistically valid test results which would represent real accidents occurring on our public roads, the manufacturer would have to crash test models of each make and model between 25 and 50 times. This large number of tests would be required to generate information concerning damage susceptibility in various combinations of speeds, accident modes and objects impacted.

Then, each test would have to be repeated several times to ensure the elimination of statistical variances caused by slight differences in production assembly or testing procedures. The net effect of having to allow for all these variables is that manufacturers would be required to conduct, at an enormous expense, between 12,500 and 25,000 tests annually to cover all makes and models of vehicles. This expense would ultimately be borne by the consumer.

In lieu of requiring the manufacturers to test their vehicles in accordance with damage susceptibility test procedures promulgated by the Secretary, we recommend that the Secretary be authorized to conduct a broad consumer information program on vehicle damageability. This program would include acquisition and analysis of insurance industry accident claims and other data, research, including computer simulation of vehicle crashes, crash testing and analysis of engineering data supplied by manufacturers on actions they have taken to update the damage protection aspects of their vehicles. From all of the information, we would develop an extensive consumer information program about damage susceptibility. To ensure widespread familiarity with the consumer information, we would disseminate the information through television, consumer and auto magazines and various other media.

125(b)

We are opposed to the promulgation of property loss reduction standards. We believe that it would be inappropriate for the Federal government to become involved in direct regulation of this aspect of motor vehicles. The competition of the market place would be less restrictive and more responsive than governmental regulation would be to the wants of consumers in this area.

We believe in the value of vigorous governmental regulations in matters of health and safety. These urgent problems require swift and coordinated solutions which the Federal government is generally best suited to develop and implement. The value of governmental regulation of this type has been amply demonstrated in the Federal vehicle safety and emission control programs.

The damage susceptibility of motor vehicles is a problem which requires more consumer information, not more governmental regulation. We believe that the consumer should have complete freedom of choice in matters other than health and safety. However, effective consumer choice can be exercised only with adequate consumer information. We propose, therefore, to develop the necessary information in the most objective manner possible and disseminate it widely.

Aside from these objections we are opposed to government imposed property loss reduction standards for the following reasons:

1. These standards would involve us heavily in design standards, including styling, rather than the performance standards that we now issue to ensure safety.
2. Specific applications of present technology are almost nonexistent in this area, as compared to the situation that existed in safety in 1966. The 1966 Act was preceded by 20 years of activity by the Society of Automotive Engineers, General Services Administration and others.

125(c)

We object to the provision requiring 5 mph (front and rear) energy absorbing bumpers by January 1, 1975 because our Federal Motor Vehicle Safety Standard No. 215 has already provided the necessary bumper requirements. Also the effective date of our standard is earlier (September 1, 1973 for 5 mph—front and rear).

Furthermore, our standard covers the requirement for standardizing bumper heights which is a very critical safety consideration. It is true that our standard does not cover the requirement for sheet metal damage protection, but all operating systems must be protected from damage. We feel that from a practical standpoint, it is impossible to design a car to meet our safety requirements without also protecting the car from significant property damage. We believe that the

consumer will receive this additional benefit without requiring a specific government imposed property loss reduction standard.

In addition, we strongly oppose setting of specific standards by legislation. Incorporating specific motor vehicle performance requirements in the Act would be incompatible with our need to be responsive to the constantly changing technology in the area of motor vehicle safety. If specific requirement were enacted by Congress, they could not be amended or revoked except by further legislative action. As a consequence, the institution of a more effective safety program would be delayed.

125(d)

We support a study of the feasibility of developing tests and test procedures and other information that will inform the public as to the risk of personal injury or death to motor vehicle occupants for all major makes and models of passenger cars. However, we cannot complete this effort and report to the President and Congress until July 1, 1973.

We do object, however, to the requirement for issuing regulations covering these tests and test procedures. The reasons for our objection are the same as those for our objection to Section 125(a) above.

Sec. 5. Public disclosure of comparative safety and susceptibility to damage of particular motor vehicles and additional standards

126(a)

Manufacturers must test production models of every make and model of passenger cars according to regulations set by the Secretary under Section 125 and furnish the results to the Secretary.

126(b)

No manufacturer shall sell, offer for sale, introduce or deliver for introduction in interstate commerce, or import into the U.S.:

(1) any passenger motor vehicle manufactured on or after January 1, 1973, unless production models of the make and model of such vehicle have been tested for damage susceptibility according to the regulation promulgated by the Secretary under section 125(a).

(2) any passenger motor vehicle manufactured on or after 120 days following the Secretary's promulgation of rules under section 125(b) unless production models of the make and model of such vehicles have been tested in accordance with such rules.

We object to all the provisions contained in section 126. A detailed discussion of our objections is contained in our comments to section 125 above.

Sec. 5. Public disclosure of comparative safety and susceptibility to damage of particular motor vehicles and additional standards

127(a)

Testing information supplied by the manufacturers shall be made public, including to prospective purchasers (Consumer Information), for easy comparisons of damage and injury susceptibility, in addition to a comparative analysis of the cost of repairing the vehicles.

127(b)(1)

Information including identification of parts, components, systems and sub-systems damaged or displaced during test will be made available to insurance companies for use in determining premium rates for property damage and personal injury.

127(b)(2)

The Secretary will report to the President and the Congress on February 1, 1973, on the extent of the insurance companies' use of this information in setting premium rates and will recommend any additional legislation, if necessary. The Secretary is authorized to conduct studies and surveys necessary to carry out the purposes of this Act.

127(b)(3)

By February 1, 1974, the Secretary shall establish procedures requiring dealers to provide insurance cost data to prospective purchasers for comparison.

127(a)

We object to the requirements for the manufacturers' testing of every make and model of car for the reasons specified in our comments to Section 125. Therefore, this requirement is not necessary.

We would favor such a consumer information program based on the government's testing and research program providing our research shows that this program is feasible and will generate information useful to the public.

127(b)(1)

We have no objection to providing the results of the government's testing and research program to insurance companies or their designated agents and State insurance regulatory agencies for use in determining insurance premium rates for property damage and personal injury.

127(b)(2)

We have no objection to the concept of reporting to Congress on the use that insurance companies are making of consumer information in setting rates. The timing of the report however, must be dependent upon the date that consumer information can be made available for the use of insurance companies.

127(b)(3)

We object to this section because we do not believe that consumer information should be provided through automobile dealers. This would not be the most efficient system since dealers will naturally have a tendency to downplay information which might reflect unfavorably on their model line. We recommend maximum use of the media including television, auto magazines, consumer publications and other similar means of disseminating this information to the public more effectively.

Sec. 5. Public disclosure of comparative safety and susceptibility to damage of particular motor vehicles and additional standards

128

The Secretary will issue Federal Motor Vehicle Safety and property loss reduction standards requiring that all motor vehicles manufactured after January 1, 1975, be designed and constructed in order to facilitate motor vehicle inspection and repairs needed to meet inspection requirements.

We object to the requirement of property loss reduction standards for the reasons stated in our comments to Section 125 above.

We also object to the requirement for motor vehicle safety standards to facilitate motor vehicle inspection. A detailed discussion of our objections is contained in the comments to Title V of the bill in Section 501.

Sec. 6. Judicial review

Extends judicial review to standards to facilitate motor vehicle inspection and necessary repairs (sec. 128) and to regulations issued under sec. 125.

We object to issuance of regulations in Sections 125 and 128 for reasons stated above. Therefore, this section is not necessary.

Sec. 7. Safety research

Adds the authority for the Secretary to collect data in order to determine the relationship between passenger motor vehicle performance and design characteristics and

- a. property damage resulting from motor vehicle collisions, and
- b. the occurrence of personal injury or death resulting from such accidents.

We have no objection to this section.

Sec. 8. Cooperation with other agencies

Adds authority for Secretary to cooperate in the planning and development of tests and testing procedures established under Sec. 125 and methods for inspecting and testing to determine compliance.

We object to Section 125. Therefore, this section is not necessary.

Sec. 9. Prohibitions and exceptions

- (1) Amends section 108(b)(1)(3) and (5) to include section 126(b) (Testing of production makes and models)

- (2) Amends paragraph (2) by adding property damage standards and tests (Penalties will not be enforced if person establishes he did not have

reason to know in the exercise of due care that the vehicle did not conform to safety or property damage standards or had not been tested accordingly).

(3) Amends paragraph (3) to prohibit importation of non-tested vehicles. We object to Sections 125 and 126. Therefore, this section is not necessary.

Sec. 10. Penalties

Violators of provisions concerning:

Compliance with motor vehicle and property loss reduction standards (sec. 108);

Keeping records and reporting data (sec. 112)

Certification (sec. 114)

Passenger motor vehicle testing (sec. 126);

Inspection (sec. 112);

All subject to penalties of up to \$5,000 for each violation.

We object to the provisions of this section. We feel that the present penalty provisions of our Act are sufficient and, furthermore, we do not favor the requirements for property loss reduction standards (as stated in our objections to Section 125) or manufacturers testing all makes and models of cars (as stated in our objections to Section 126.) We also believe that the \$5,000 penalty is too extreme. We feel that the penalties provided in the current law are adequate at the present time coupled with the other remedies available to us such as injunctions prohibiting sales. When we feel that penalties in the current law are no longer adequate enforcement tools we will not hesitate to recommend either increase penalties and/or other remedial authority.

Sec. 11. Injunctive relief

U.S. District courts can restrain sale or importation of non-tested vehicles.

Since we objected to manufacturers' testing all makes and models of cars under Section 126, this section is not necessary.

Sec. 12. Repurchase or replacement

Non-compliance includes failure to meet property damage standards or to meet testing requirements.

We object to setting property damage standards (under section 125) and requiring testing by manufacturers (under section 126). Therefore, this section is not necessary.

Sec. 13. Inspection of manufacturing facilities

Secretary is authorized to inspect establishments where motor vehicles are being tested.

Since we objected to testing by manufacturers under Section 126, this section is not necessary.

Sec. 14. Certification of conformity

Motor vehicles must be certified as tested for property damage and injury comparison.

Because of our objections to Sections 125 and 126, this section is not necessary.

TITLE V. DIAGNOSTIC INSPECTIONS, REGISTRATIONS, AND TITLING STANDARDS

501(a)

By January 1, 1973, the Secretary shall amend Highway Safety Program Standard No. 1 (PMVI) to include the following provisions:

(1) The standard will require inspection when a title is transferred and whenever safety related parts, systems, etc. are damaged.

(2) Inspectors, certified by the State according to provisions established by the Secretary, will certify safe operating conditions. Certificate must be delivered by seller to purchaser of a motor vehicle at the time of sale. The certified inspector cannot be involved in other automotive services (sales, repairs) unless the vehicle population is insufficient to warrant independent inspectors and the State assures against effects of conflict of interest.

(3) The standard will be expressed as a performance standard applicable to new and used motor vehicles.

501(b)

By January 1, 1973, the Secretary will amend Highway Safety Program Standard No. 2 (registration) so that registration and titling programs are similar to those contemplated by the Uniform Motor Vehicle Code and Model Traffic Ordinance.

501(a)

We cannot, at this time, advocate or support the establishment of a nationwide independent diagnostic inspection system. We feel that the state-of-the-art necessary to justify such a system is several years away. Further, we estimate that the annual cost of the nationwide independent diagnostic system required by the bill is extremely high.

For example, the construction plus operating costs of the diagnostic centers would be in the range of \$1 billion per year. Since we do not have adequate information as to the cause and effect relationship between vehicle defects and crashes, we should not embark on such a costly venture at this time.

We also believe that modifications to our Highway Safety Program Standards can best be handled by administrative action under existing authority. Hence, this provision is not necessary.

Furthermore, we are currently amending our Highway Safety Program Standard No. 1 on inspection to require that a motor vehicle be inspected whenever the title of the vehicle is transferred or whenever any vehicle cannot be driven from the scene of an accident.

We must further emphasize that we do not, at this time, support periodic motor vehicle inspection (PMVI) as the *only* type of inspection system for our States. However, we do strongly support the objective of removing unsafe motor vehicles from the road.

The major problem with PMVI is that we do not yet know how to design an inspection system that will assure identification of unsafe vehicles quickly, accurately and inexpensively.

This does not mean, and must not be interpreted as saying, we are doing away with used vehicle surveillance. It does mean that we are giving States a certain amount of flexibility in how they accomplish the job of removing unsafe vehicles from the road. We will evaluate results and we will strongly oppose the efforts of any State to abandon this area of concern.

We also believe that automated diagnostics will be the technique of the future. But, we are not, at this time, prepared to support legislation which levies upon the States a system of independent diagnostic inspection systems. Too much is unknown. What is taken as known is by no means positive. In the United States today, based on available data, there is no statistical difference in fatality rates between States that have periodic motor vehicle inspection and those that do not. This is not necessarily an indictment of the concept of motor vehicle inspection. It may be an indictment of inspection as practiced today. It is for this reason that we are modifying our PMVI Safety Standard to permit more flexibility in the States so that we can make our present used vehicle surveillance programs more effective.

We do not have adequate information as to the cause and effect relationships between vehicle defects and crashes. Therefore, additional research and analysis are required before we could recommend a national system of independent diagnostic centers for motor vehicle inspections. Some research has been underway for several years. But considerably more effort is required to determine, for example, safety-critical components, tolerance limits for performance, inspection procedures and equipment. Much more trade-off analysis is also required to determine the most cost-effective approach to vehicle surveillance, including the development of automated vehicle diagnostics.

For all of the above reasons, we cannot support the provisions of this section.

501(b)

We agree with the provisions of this section. However, we believe that modifications to our Highway Safety Program Standards can best be handled by administrative action under existing authority. Furthermore, we are amending Highway Safety Program Standard No. 2 on registration to incorporate a registration and uniform titling program as recommended by the National Motor Vehicle Code. Therefore, this provision is not necessary.

TITLE V. DIAGNOSTIC INSPECTION, REGISTRATION AND TITLING PROGRAMS

502 Reports on Implementation

502(a)

By January 1, 1972, the Secretary shall report to the President and Congress the progress of the States in implementing Highway Safety Program Standards 1 and 2 of June 27, 1967 and will recommend legislation to facilitate State compliance by January 1, 1973.

502(b)

Each state certified by the Secretary as being in compliance with these provisions shall, after January 1, 1973, receive between 10 to 50 percent of the annual costs of the programs based on the degree of compliance.

502(c)

By January 1, 1974, the Secretary will report to the President and Congress the progress of the States in implementing the amended programs standards and will recommend legislation to facilitate State compliance by January 1, 1975.

502(d)

By July 1, 1973, the Secretary shall:

(1) certify each State PMVI and registration program that meets the standards

(2) not approve a State highway safety program that hasn't established a program to implement standards

(3) reduce the Federal Aid Highway funds apportioned on or after January 1, 1975, to any State not implementing an approved highway safety program. The funds will be reduced by 10% for each year of non-compliance (not to exceed 50%).

502

Since we are opposed to a national independent diagnostic inspection system as required in Section 501(a) (see our previous comments to that section), we do not feel that Section 502 is necessary. Therefore, we would favor deletion of Section 502 in its entirety.

TITLE V. DIAGNOSTIC INSPECTIONS, REGISTRATIONS, AND TITLING STANDARDS

503

Authorizes appropriations to the Department in such sums as may be necessary to carry out the provisions of this Act.

We have no objections to this section.

AMERICAN MUTUAL INSURANCE ALLIANCE,
Washington, D.C., July 22, 1971.

HON. WARREN G. MAGNUSON,
Chairman, Senate Commerce Committee,
New Senate Office Building,
Washington, D.C.

DEAR SENATOR MAGNUSON: By way of this letter, we would like to take the opportunity to comment on the Administration's proposed Automobile Owners Information Act of 1971 and on Mr. Douglas Toms' recent testimony.

It is ironic that the Administration objects to S. 976 on grounds that it "would require the establishment of automobile standards for purely economic reasons" maintaining that it is unreasonable to require auto manufacturers to test their products except for health and safety purposes. But, Mr. Toms evidently has no such qualms about requiring auto insurers to collect and make available massive amounts of auto damageability information "for purely economic reasons"—even though they bear no responsibility for auto design.

The detailed claims information which would be requested of insurers under Section 503 is not currently available in the form indicated in the bill. Moreover, it would be extremely costly for most insurance companies to redo their claims procedures and computer systems to gather and process such information.

For example, we believe that such information requirements would have serious impact on one of the most important efficiency costcutting programs which many companies have instituted in the past several years. Being fully conscious of the need to return in benefits to the public as great a share of the premium dollar as possible, these companies have instituted telephone claim adjusting units for the purpose of settling certain type claims as rapidly as possible. This practice has had two important consequences. First, both policyholder and third-party claimants have found much of the red tape taken out of the claim settlement practice. They have had their claims settled promptly, fairly, and without having to put up with the uncertainty which has characterized some automobile insurance claim settlement practices. Second, these new procedures have reduced the claims settlement expenses to the companies and

thus, have allowed a greater proportion of the premium dollar to be returned to consumers by way of benefits.

If, on the other hand, the insurance industry is required to produce the type of information called for in Section 503 on all claims, extensive investigation of each accident claim will have to be preformed and this, we believe, will be impossible for these telephone claims units to perform.

Imposing such requirements on auto insurers not only would put the responsibility on the wrong industry, but would increase auto insurance costs at a time when insurers are under strong pressures to reduce overhead costs and to return a greater portion of the premium dollar in the form of benefits to the accident victim.

We question whether it is in the public interest to require insurers to produce and report such detailed information on all claims, particularly in view of the fact that meaningful consumer information on new models would not be available until some months after they appeared in dealers' showrooms and on the highways.

We also question the desirability of Section 504. We believe that it puts the "cart before the horse." This Section would require our companies to provide the Department of Transportation with a description of the extent to which our rates are affected by the damageability and crashworthiness of individual makes and models of automobiles. Yet, there is nothing in the Administration's proposal which would give our companies the type of information required for them to structure a rating system on the basis of damage susceptibility and crashworthiness.

S. 976, on the other hand, would require auto manufacturers to make available to our companies, prior to the time new car models are offered for sale, the type of crash data upon which a sound rating system can be structured. We specifically endorse S. 976 because it does provide the necessary information base on which sound actuarial judgments can be made for rate-making purposes. We strenuously oppose legislation which would impose heavy responsibilities on our companies without requiring auto manufacturers to provide the timely information needed to fulfill such responsibilities.

In our judgment, the approach urged by Mr. Toms is a circuitous, slow and ineffective solution to the problems created by today's excessively fragile car designs. Moreover, it would place the responsibility and cost burden on the wrong shoulders—i.e., on the car buyer and the auto insurance policyholder, instead of the auto manufacturers who are responsible for the design and damageability of the automobile. The Administration's proposal relies almost solely on informed buyer choices in the market place to bring improvements in crashworthiness and damage susceptibility. But Mr. Toms, himself, stated that the data which would be published would not reach the consumer until many months following the introduction and sale of new car models. Most of the new cars in any given year would already be sold by the time such information reached the potential car buyer. It is therefore unrealistic to expect consumers to bring pressures on the manufacturers to build better cars if they are not given the necessary information in time to make informed buying decisions.

In fact, such delayed information regarding damage susceptibility can only hurt the purchasers of certain car models who were unaware at the time of the purchase of the potential drop in resale value of their automobile.

More effective methods are available. What is needed is a mandatory standard which will require that all cars reach a minimum level of crash performance. By establishing standards already well within the capabilities of the Federal government—if it so desired—such safe American automobiles as estimated \$1-billion a year by preventing the excessive damage now resulting in non-wrecked crashes.

In answer to questions, Mr. Toms said that by concentrating on safety the economic factor will take care of itself. He stated that the cost of the car is not the only factor. Although there have been instances where more safety features have been brought about in part by Federal safety standards, the total auto insurance bill paid by the typical vehicle owner has continued to rise because of the escalation of vehicle damage and auto repair costs. With the vehicle damage coverage accounting for two-thirds or more of the typical auto insurance bill, it is obvious that changes in car design are the key to any overall reduction in the economic costs of auto crashes.

Mr. Toms also referred several times to the matter of priorities, stressing that "nothing must be allowed to dilute our safety records." We agree that safety has

502(b)

Each state certified by the Secretary as being in compliance with these provisions shall, after January 1, 1973, receive between 10 to 50 percent of the annual costs of the programs based on the degree of compliance.

502(c)

By January 1, 1974, the Secretary will report to the President and Congress the progress of the States in implementing the amended programs standards and will recommend legislation to facilitate State compliance by January 1, 1975.

502(d)

By July 1, 1973, the Secretary shall:

(1) certify each State PMVI and registration program that meets the standards

(2) not approve a State highway safety program that hasn't established a program to implement standards

(3) reduce the Federal Aid Highway funds apportioned on or after January 1, 1975, to any State not implementing an approved highway safety program. The funds will be reduced by 10% for each year of non-compliance (not to exceed 50%).

502

Since we are opposed to a national independent diagnostic inspection system as required in Section 501(a) (see our previous comments to that section), we do not feel that Section 502 is necessary. Therefore, we would favor deletion of Section 502 in its entirety.

TITLE V. DIAGNOSTIC INSPECTIONS, REGISTRATIONS, AND TITLING STANDARDS

503

Authorizes appropriations to the Department in such sums as may be necessary to carry out the provisions of this Act.

We have no objections to this section.

AMERICAN MUTUAL INSURANCE ALLIANCE,
Washington, D.C., July 22, 1971.

HON. WARREN G. MAGNUSON,
Chairman, Senate Commerce Committee,
New Senate Office Building,
Washington, D.C.

DEAR SENATOR MAGNUSON: By way of this letter, we would like to take the opportunity to comment on the Administration's proposed Automobile Owners Information Act of 1971 and on Mr. Douglas Toms' recent testimony.

It is ironic that the Administration objects to S. 976 on grounds that it "would require the establishment of automobile standards for purely economic reasons," maintaining that it is unreasonable to require auto manufacturers to test their products except for health and safety purposes. But, Mr. Toms evidently has no such qualms about requiring auto insurers to collect and make available massive amounts of auto damageability information "for purely economic reasons"—even though they bear no responsibility for auto design.

The detailed claims information which would be requested of insurers under Section 503 is not currently available in the form indicated in the bill. Moreover, it would be extremely costly for most insurance companies to redo their claims procedures and computer systems to gather and process such information.

For example, we believe that such information requirements would have serious impact on one of the most important efficiency costcutting programs which many companies have instituted in the past several years. Being fully conscious of the need to return in benefits to the public as great a share of the premium dollar as possible, these companies have instituted telephone claim adjusting units for the purpose of settling certain type claims as rapidly as possible. This practice has had two important consequences. First, both policyholder and third-party claimants have found much of the red tape taken out of the claim settlement practice. They have had their claims settled promptly, fairly, and without having to put up with the uncertainty which has characterized some automobile insurance claim settlement practices. Second, these new procedures have reduced the claims settlement expenses to the companies and

thus, have allowed a greater proportion of the premium dollar to be returned to consumers by way of benefits.

If, on the other hand, the insurance industry is required to produce the type of information called for in Section 503 on all claims, extensive investigation of each accident claim will have to be preformed and this, we believe, will be impossible for these telephone claims units to perform.

Imposing such requirements on auto insurers not only would put the responsibility on the wrong industry, but would increase auto insurance costs at a time when insurers are under strong pressures to reduce overhead costs and to return a greater portion of the premium dollar in the form of benefits to the accident victim.

We question whether it is in the public interest to require insurers to produce and report such detailed information on all claims, particularly in view of the fact that meaningful consumer information on new models would not be available until some months after they appeared in dealers' showrooms and on the highways.

We also question the desirability of Section 504. We believe that it puts the "cart before the horse." This Section would require our companies to provide the Department of Transportation with a description of the extent to which our rates are affected by the damageability and crashworthiness of individual makes and models of automobiles. Yet, there is nothing in the Administration's proposal which would give our companies the type of information required for them to structure a rating system on the basis of damage susceptibility and crashworthiness.

S. 976, on the other hand, would require auto manufacturers to make available to our companies, prior to the time new car models are offered for sale, the type of crash data upon which a sound rating system can be structured. We specifically endorse S. 976 because it does provide the necessary information base on which sound actuarial judgments can be made for rate-making purposes. We strenuously oppose legislation which would impose heavy responsibilities on our companies without requiring auto manufacturers to provide the timely information needed to fulfill such responsibilities.

In our judgment, the approach urged by Mr. Toms is a circuitous, slow and ineffective solution to the problems created by today's excessively fragile car designs. Moreover, it would place the responsibility and cost burden on the wrong shoulders—i.e., on the car buyer and the auto insurance policyholder, instead of the auto manufacturers who are responsible for the design and damageability of the automobile. The Administration's proposal relies almost solely on informed buyer choices in the market place to bring improvements in crashworthiness and damage susceptibility. But Mr. Toms, himself, stated that the data which would be published would not reach the consumer until many months following the introduction and sale of new car models. Most of the new cars in any given year would already be sold by the time such information reached the potential car buyer. It is therefore unrealistic to expect consumers to bring pressures on the manufacturers to build better cars if they are not given the necessary information in time to make informed buying decisions.

In fact, such delayed information regarding damage susceptibility can only hurt the purchasers of certain car models who were unaware at the time of the purchase of the potential drop in resale value of their automobile.

More effective methods are available. What is needed is a mandatory standard which will require that all cars reach a reasonable level of crash performance. By establishing standards already well within the available technology, the Federal government—if it so desired—could save American consumers an estimated \$1-billion a year by preventing the excessive damage now occurring in low-speed crashes.

In answer to questions, Mr. Toms testified that "by concentrating on safety, the economic factor will take care of itself." Unfortunately, this is not the case. Although there have been indeed some encouraging reductions in bodily injury brought about in part by Federal safety standards, the total auto insurance bill paid by the typical vehicle owner has continued to rise because of the escalation of vehicle damage and auto repair costs. With the vehicle damage coverages accounting for two-thirds or more of the typical auto insurance bill, it is obvious that changes in car design are the key to any overall reduction in the economic costs of auto crashes.

Mr. Toms also referred several times to the matter of priorities, stressing that "nothing must be allowed to dilute our safety records." We agree that safety has

priority over property damage. However, it has not been demonstrated that these two goals are inconsistent or mutually exclusive. Nowhere in his testimony did Mr. Toms state that there is any evidence that cars cannot be built to satisfy both safety and damageability requirements.

It is unclear whether Mr. Toms objects to having the DOT assume greater responsibility for regulating auto damageability on philosophical grounds, or whether he believes his staff and budget are inadequate to handle the job. If it is simply a matter of inadequate funds, then the Alliance strongly urges that Congress provide DOT with adequate resources to take on the additional responsibilities contemplated in S. 976, in view of the enormous benefits which would accrue to consumers.

All in all, we believe that the Administration's proposal is not a good substitute for S. 976. The testimony before the Committee has amply demonstrated both the need for strong Federal action along the lines of S. 976 and the abilities of both government and private industry to meet the demands imposed by S. 976. We respectfully urge you and your Committee to recommend to Congress the enactment of S. 976 with the suggested amendments which we proposed in our original testimony.

We would appreciate it if this letter could be incorporated in the hearing record.

Sincerely,

ANDRE MAISONPIERRE,
Vice President.

(Whereupon, at 11:28 p.m., the committee adjourned, subject to the call of the chairman.)

ADDITIONAL ARTICLES, LETTERS, AND STATEMENTS

U.S. SENATE, COMMITTEE ON FOREIGN RELATIONS,
Washington, D.C., May 8, 1971.

Hon. WARREN G. MAGNUSON,
Chairman, Senate Commerce Committee, Washington, D.C.

DEAR MAGGIE: In view of your Committee's hearings on legislation dealing with automobile insurance, I am sending along for your Committee's consideration the complaint of one of my constituents:

"Last month I was driving to work and, basically, a woman came out of her driveway and hit the side of my car, causing more than \$400 damage.

"After filing a report with the state and my insurance company, Travelers, I was ultimately informed that the woman's company, Employers, now refused to honor my claim. My company will pay only about \$250.

"I have two alternatives as I see them: The first is to expend time and money to put the wheels of our judiciary system into motion and hope within a few years to get a judgment in my favor; the second is to take my company's rather arbitrary figure of about \$350 (less my \$100 deductible), swallow my pride and face higher insurance rates and a black mark against my insurance record.

"This seems to be a gross infraction of my rights as an American citizen. I am an oppressed minority—I stand alone to face two multimillion dollar insurance companies, each with an impressive legal staff, and if I wish to keep my pride, I must spend my money to hire a legal counsel who could at best start something which may finish in my favor in a few years.

"As an American citizen, I can only appeal to my government when I am faced with a situation where I am at the mercy of two giant corporate conglomerates."

Sincerely yours,

Charles D. Kays

(The following was referred to on 5/12/71 of Mr. Magnuson's committee.)

LAWRENCE RADIATION LABORATORY'S
EMERGENCY ENERGY ABSORBING DEVICE

In 1960 a device was invented for safely stopping a moving mass that might break loose during operation.

The device was an assembly of sheet steel membranes and pointed steel pins. If the pins were struck by a part that had broken loose, they would in turn puncture the membranes. See Photos XBB712-733 and -734 and Drawings 9M7644A and 9N1623B. The kinetic energy of the moving mass was dissipated by the deformation of the membranes.

The original requirements dictated safely stopping 8000 pounds moving at 7.5 ft/sec (or 5.1 mph), in 4.25 in. with a deceleration of 2.5 g. Eight pins were used.

This device worked exceptionally well, and once the "crash pad" was actuated the deformed membranes could be easily and quickly replaced.

It appears that the incorporation of this device would be a dependable low-cost way of solving the problem of low speed crash of automobiles. They could be installed between the auto's bumper and frame and would absorb the collision energy.

Calculations and test data show that a 4000-pound auto can be stopped safely with a deceleration of 2.5 g using a crash pad with 4 pins and a membrane stack about 5 in. long. Shorter stopping distances (with correspondingly higher forces) can readily be obtained by simple changes in the number of pins and in the material of membranes.

This device is covered by U. S. Patent No. 3181653, issued May 4, 1965. The inventor, Jack Roskelley, has assigned the patent rights to the U. S. Government through the AEC. It presumably would be available on a royalty-free basis.

| LAWRENCE RADIATION LABORATORY - UNIVERSITY OF CALIFORNIA | | FILE NO | PAGE |
| ENGINEERING NOTE | | BERKELEY 7308-OL M23 | 1 OF 13 |
| SUBJECT BEVATRON EXTERNAL PROTON BEAM | | BY JACK ROXELLEY | |
| INT. BM. DEFLECTION - INTERNAL MAG. EMERGENCY STOP | | DATE 7-NOV-1960 | |

UCID #3506

PROBLEM:

THE MAGNETS AND EQUIPMENT REQUIRED FOR DEFLECTING THE PROTON BEAM ARE OF CONSIDERABLE MASS AND MUST BE PLUNGED AND RETRACTED QUICKLY AND PRECISELY TO INTERCEPT AND DEFLECT THE ORBITING BEAM.

FAILURE IN A CONNECTING MEMBER DUE TO FATIGUE OR OTHER STRESSES COULD CAUSE THE MOVING PARTS TO BREAK AWAY FROM THE PLUNGER EQUIPMENT.

A BREAK AT TOP VELOCITY DURING PLUNGE OR RETRACTION COULD CAUSE SERIOUS DAMAGE TO THE ENTIRE BEVATRON MACHINE BY CRASHING INTO THE SIDES OF THE TANGENT TANK AND POSSIBLY RUPTURING THE TANK CAUSING AN IMPLOSION OF AIR INTO THE VACUUM SYSTEM.

REQUIREMENTS:

A DEVICE IS REQUIRED FOR THE ABSORPTION OF ENERGY IN STOPPING THE LOOSE EQUIPMENT. THE ENERGY MUST BE ABSORBED AT A RATE NOT TO EXCEED FIVE "GS" TO PREVENT UNDOE DAMAGE TO MAGNET PARTS AND APPENDAGES. THE DEVICE MUST BE COMPATIBLE TO VACUUM SERVICE WITH NO MAINTENANCE. INSTALLATION AND REPLACEMENT COSTS MUST BE LOW.

DESIGN:

A STACK OF METAL MEMBRANES INDIVIDUALLY SEPARATED BY METAL SPACERS HAVING HOLES SO SPACED AND ALIGNED AS TO PERMIT CLEAR PASSAGE OF A PIN. THE PIN IS DESIGNED TO PASS THROUGH THE MEMBRANES CONSECUTIVELY THUS CHANGING THE KINETIC ENERGY TO MECHANICAL AND WORKING ENERGY AT A SOMEWHAT UNIFORM RATE. THE PIN HAS A CONE POINT WHICH ENLARGES THE MEMBRANE HOLES.

| | | | | |

INT. BM. DEFLECTION-INTERNAL MAG. EMERGENCY STOP | | | NAME
ROSKELLEY | DATE
7-NOV. 1960 |

STUDY :

ORIGINAL ATTENTION WAS GIVEN TO THE USE OF A BLOCK OF LEAD TO BE PENETRATED BY A STEEL SPIKE.

| <u>% PENETRATION</u> | <u>% CONE SURFACE</u> | <u>% DECELERATION</u> |
|----------------------|-----------------------|-----------------------|
| 0 | 0 | 0 |
| 10 | 1 | .27 |
| 20 | 4 | .99 |
| 30 | 9 | 2.23 |
| 40 | 16 | 3.91 |
| 50 | 25 | 6.12 |
| 60 | 36 | 8.80 |
| 70 | 49 | 13.00 |
| 80 | 64 | 17.00 |
| 90 | 81 | 21.00 |
| 100 | 100 | 26.00 |

THIS STUDY SHOWS THAT AT 50 % OF TOTAL PENETRATION, ONLY 13.50 % OF THE TOTAL FORCE HAS BEEN ABORED. DECELERATION IS NOT UNIFORM AND INCREASES RAPIDLY TOWARD THE END POINT. THIS CONDITION WOULD NOT BE ACCEPTABLE.

STUDY :

HONEYCOMB MATERIALS AND DESIGN WERE EXAMINED AS A POSSIBLE SOLUTION TO THE ABSORPTION OF THE IMPACT OF THE MAGNETS.

| | | | |
|--|--|----------------------|---------|
| LAWRENCE RADIATION LABORATORY - UNIVERSITY OF CALIFORNIA | | FILE NO | PAGE |
| ENGINEERING NOTE | | BERKELEY 7308-02 M23 | 3 OF 13 |
| SUBJECT BEVATRON EXTERNAL PROTON BEAM | | NAME ROSKELLEY | |
| INT. BM. DEFLECTION - INTERNAL MAG. EMERGENCY STOP | | DATE 7-NOV. 1960 | |

AFTER EXAMINATION OF DATA ON HONEYCOMB DESIGN, CERTAIN UNDESIRABLE FEATURES WERE NOTED - HONEYCOMBED MATERIALS ARE GENERALLY DESIGNED TO WITHSTAND COMPRESSIVE AND IMPACT LOADINGS. THE DESIGN DOES NOT PERMIT UNIFORM ABSORPTION OF IMPACT. THE RESISTANCE TO IMPACT AND COMPRESSIVE FORCES AT CONTACT AND UP TO POINT OF COLLAPSE OF THE CELLULAR STRUCTURE OF THE HONEYCOMB IS VERY HIGH. AT THE POINT OF COLLAPSE, THE RESISTANCE FALLS OFF SHARPLY THEN RISES SHARPLY AS THE MATERIAL COMPRESSES INTO A DENSER MASS. THIS TYPE OF IMPACT ABSORPTION WOULD PROVE UNSATISFACTORY BECAUSE OF THE DAMAGING EFFECTS THROUGH THE HIGH-LOW-HIGH RESISTANCE FEATURES.

STUDY

CONSIDERATION WAS GIVEN TO THE POSSIBILITY OF CASTING A SPECIAL HONEYCOMBED DESIGN THAT WOULD GIVE LOW INITIAL IMPACT RESISTANCE YET MAINTAIN A UNIFORM RESISTANCE TO COMPRESSION THROUGHOUT. MATERIAL DISPLACEMENT WOULD, HOWEVER, CAUSE AN ULTIMATE INCREASE IN MASS AND RESISTANCE TOWARD THE END POINT SO THIS STUDY WAS DISCONTINUED.

STUDY

LAMINATED MEMBRANES AND SPACERS WERE CONSIDERED NEXT. INFORMATION AT HAND INDICATED THIS ARRANGEMENT WOULD PRODUCE A RELATIVELY UNIFORM RATE OF ENERGY ABSORPTION AND DECELERATION WHEN PIERCED BY A CONE-POINTED PIN.

April 15, 1971.

Ford Motor Co. Listens
American Road
Dearborn, Michigan 48121

Dear Sir:

Your claim that "Ford Listens" in recent television commercials is an insult to any thinking person.

Having bought a 1965 and 1968 Ford Meteor, you might be interested in knowing why I won't be buying your '71 model. Mechanically, they were both fine cars; as trouble free as one can expect. Unfortunately, you also have a way of building vulnerability into your cars. After replacing numerous parking light and tail light lenses on both cars which were all broken while parked, you couldn't begin to convince me that any car design which allows this to happen is not deliberate on the part of the manufacturer. Did you know that to replace the tail light lens on my '68 requires the partial removal of the rear bumper, and the total cost is about \$15.00? Did you know that your Company does not make bumper guards to protect me? Were your intricately-made parking light and tail light housings or assemblies designed for practical reasons, or because they are so costly to repair or replace? Is this how Ford has to make money? Are you keeping statistics on the number of grilles that have to be replaced on your '71 Fords and Meteors because a careless driver backed into them? Don't you feel a moral obligation to provide us with a functional bumper that can withstand this type of impact, rather than the chrome-plated ornament you now provide? I think not.

I know this letter will have no impact, but perhaps some day soon enough people like me can get people like you to deliver the product they're capable of. I also know that most car manufacturers share the same guilt, but I drive a Ford, and they don't claim to listen.

Dear Sirs:

We have a 1970 LTD stationwagon. Last week my son, in parking the wagon, broke out the white glass of the tail light. The red on the top and bottom was substantially untouched.

It would be assumed that it would be a simple matter to buy a new lens, remove a couple of screws, and replace the broken lens. Not on a Ford!

My son was told at Dick Herriman Ford that he (my son) could not replace the lens because of the way it was installed. He was given an estimate of \$13 and some cents for the replacement. My son called me and I told him to leave the car and have it fixed, which he did.

When my son picked up the car he was submitted a statement for \$23.60. When he complained, he was told the chrome around the light was bent and it was necessary to replace another part. In order to pick up the car, he paid the \$23.60.

I do not know if Dick Herriman Ford is playing the old shell game or not, but I do know that something is drastically wrong when it costs \$23.60 to replace a broken tail light lens. Either the car is intentionally or stupidly incorrectly engineered.

My first Ford was a 1963 Ford. I have driven Ford products ever since. We presently have, in addition to the stationwagon, a 1971 Bronco and a 1970 Cougar. From my experience with servicing and repairs on the wagon and Bronco, I doubt if I will own another Ford product. I have always believed and practiced "Buy American." Ford's "ingenuity" and "Better Ideas" in insulting its customers with poor engineering and service can be thanked for my change in philosophy.

Very truly yours,

BREINER, RAMIK & BROWN

May 21, 1971

Honorable Senator Phillip Hart
Senate Building
Washington, D.C.

and

Mr. Ralph Nadar :
Washington, D.C.

Gentlemen:

Herewith please find enclosed a copy of a letter that was addressed to the Cadillac Motor Car Division of the General Motors Corporation with respect to bumpers that they are putting on their cars and which is self explanatory. I am also enclosing the reply that was received from the Cadillac Motor Car Division, which is self explanatory, and which is completely unsatisfactory.

In view of the congressional hearings regarding automobiles and particularly the value of bumpers, we trust that the letter that was sent to Cadillac and the reply will be of assistance to you in your hearings.

Yours truly,

Nathan I. Goldin

Cadillac Motor Car Division
General Motors Corporation
2860 Clark Street
Detroit, Michigan 48210

Attention: Mr. Caputo
Customer Relations

Gentlemen:

In January 1971 I purchased from Klett Cadillac and got delivery of a 4 door Cadillac for my wife, which at this date has only about 350 miles.

The writer drives a 1970 Cadillac which was parked in our office lot at my place of business on May 10, 1971.

My wife in her Cadillac came to my office on that date and asked me to drive her 1971 Cadillac for the purpose of going to lunch. I got into her car which was parked on the opposite side from where my car was parked in my parking lot and backed out for the purpose of driving out of our parking lot, and accidentally backed into the 1970 Cadillac which I drive. The rate of speed in backing out was no more than one or two miles per hour, but even at that speed because of the contact between the cars caused a dent in the bumper in the 1971 Cadillac.

Upon examination of the dent in the bumper, I found that the 1971 Cadillac bumper was made of apparently very soft material and paper thin.

Obviously, bumpers are made for exactly that purpose to safeguard the car and the bumper should be of such material and of such weight to withstand that kind of a minute bump.

I have complained about the 1971 Cadillac car for various other reasons and Mr. A. J. Mitchell of the Cadillac Motor Division apparently looked at my complaints with the 1971 Cadillac was at Klett Cadillac Sales for service, and I have not heard from him since that time.

I believe that in view of my explanation that it is your duty to replace the bumper of the 1971 Cadillac car.

Yours truly,

Nathan I. Goldin

Mr. Nathan I. Goldin
Attorney at Law
21790 Coolidge Highway
Oak Park, Michigan 48237

Dear Mr. Goldin:

This will acknowledge your letter of May 14 regarding your 1971 Cadillac.

We are always pleased to be of assistance to Cadillac owners whenever possible, Mr. Goldin; however, there are no provisions in the warranty whereby damage caused by other than an original defect in material or workmanship is covered.

We know of no automobile manufacturer whose warranties provide for impact damage such as you describe. Under the circumstances, we regret that we would be unable to comply with your request.

We do, however, appreciate having had an opportunity to review this matter for you.

Very truly yours,

A handwritten signature in cursive script, reading "A. P. Caputo".

-db

1920

STONECREST FURNITURE HOUSE,
June 8, 1971.

DEAR SIRS: With your add in the Life you invited your own trouble. You said you will answer, I do not think you will.

Let me introduce myself. Werner Wandschneider 69 years old. I worked for the Solex Carburetor Comp in Berlin Germany from 1923 until 1945, mostly as field engineer on the car manufacturer plants. I worked with Opl Iugescheiche in BMW Munich, Dipl Ing Uhlenhaut now Director Mercedes, Dipl Ing Porsche on racing cars and VW, with Adam Opel A6, General Motors Buick Div. Russelsheim and in your Ford Plant Koln.

To that time I didn't think of it that General Motors and you Ford bought or erected Plants in Germany and England to a time as here was something like a depression.

There was a Senate Committee hearing in Washington some weeks ago. Mr. Nader was a witness and I agree with him in many ways, let me explain why.

First, here are built cars, too large, too high in price and gas consumption to be sold overseas, this hurt our export-import balance.

These cars are built mostly for a short period of time and the models changed too often. This is good for tool and dye makers, but not for export.

The dealers overseas maybe not able to stock all parts for this fast changing models and can't serve their customers the right way.

The building of oversized cars here lead to the import of small European cars and now added Japanese cars.

To this imports some car manufacturers added more import with bringing in their overseas built small cars like Opel, Simca etc. Pontiac dealers in our section took on Datsun. I think you bring in some of your products out Köln Germany too? Does this help our export-import deficit?

Now look at the front view of our cars, does it look like an engineering job or more like an architects job?

I think it is high time that the Government set rules how cars have to be built. Limited in size and power with *straight* rubber guarded bumpers in front and back, all in a equal high from the ground, maybe springs added to the bumpers like shock absorbers to take a certain beating before costly parts get damaged. The building time for models should be set to 2-3 years before any change is made.

Look at the achievement of invisible headlights, I see nothing in it as danger. I know windshield wipers glare sometimes, but is it necessary to put them in what I call mudholes. Is it not possible to make them dark instead, what would be less costly.

I have a 1957 Studebaker Station wagon 184" long. I prefer to go with it to New York instead as going with our 1963 Chevy Biscayne Wagon 205" long.

Now, I want to buy a medium sized station wagon let's start it doing so. Your Falcon is dropped, the Dodge Dart is dropped, the Rambler Rebel grew to a Matador, the Rambler American is dropped. What's left is the American Motors (Rambler) Sportabout which has another achievement if you prefer to call it that, a deflated spare tire.

All other Ford, G.M. or Chrysler stations are 205 to 230" long.

Where I have my eyes on now is a Toyota 6 cyl Crown Wagon 185" long with *bucket reclining seats* what no one else offers here except in oversized stations in the \$5000.-range. The Toyota's, Datsun's, Volvo's all offer bucket reclining seats, why you don't?

Instead of using your brain power on the Pinto key, build me a station wagon 180 to 190" long, 150 HP 6 cyl engine, bucket reclining seats, *straight* rubber protected bumpers, visible windshield wipers and lights.

If that happens I would say Ford had a better idea. It will not happen and I will not get an answer.

Regards,

WERNER WANDSCHNEIDER

Senator VANCE HARTKE,
Washington, D.C.

DEAR SENATOR HARTKE: TV news flashes by fast and one cannot back up to check, but I believe you entered the Nader/Stevens debate about auto bumpers.

From memory, you were wringing your hands and you asked "Where did we [the Congress] fail in our legislation?"

1921

Congress did not 'fail'—the colossal auto-makers are simply ignoring.

It is I who over a decade ago prodded Antitrust into jailing the electrical executives who had put their heads together on pricing.

It worked—and soon after an Antitrust lawyer called on me, stating he wanted to meet the chap with the bright idea!

Just prod Justice into jailing auto executives for ignoring the new safety regulations—you'll then see action.

It's the colossal corporate BILGE. Weekends over TV, 'Esso' (Standard of New Jersey: Rockfellers) lathers the public on its early ecological pursuits.

It wasn't Jesus Christ after all but ESSO!

Sincerely yours,

LEON J. SALTER.

MAY 10, 1971.

Senator T. STEVENS,
Washington, D.C.

DEAR SENATOR STEVENS: You did not sound very logical in your argument with Ralph Nader as we saw and heard on tonite's TV news. Your comments to Nader leave serious doubts in my mind about your sincerity in representing the people. I only hope these pictures are seen by your constituents.

Nader isn't always right but you looked bad in this exchange. Nader couldn't be more correct and you argued (rather sillily) in a way that indicated your heart was not in it. What the hell do you mean by all this progress that you argue about. The automotive industry is negative on all progressive movements. They should be forced into bumpers that can be bumped, bearings that bear a load (for longer than 30,000 miles) etc.

Please help the consumer—just a little.

Sincerely,

A. E. LAURENCE.

MAY 11, 1971.

Re the Stevens clash.

[From Voice of the People, Chicago Tribune]

Recently Ralph Nader clashed with members of the Senate Commerce Committee when he accused the automobile industry of "massive thievery" and the committee with "groveling."

I wholeheartedly agree with Mr. Nader's arguments before this committee. Sen. Ted Stevens (R. Alaska) informed Mr. Nader he is too negative and looks for the worse in people, not what's good.

I am not familiar with Sen. Stevens' age, but I know for a fact, as well as other mature citizens of my age who still reminisce of how they used to manufacture automobiles.

Fifty years or so ago, the steel body of a car was constructed of a heavy gauge of steel and not of the tissue type of steel today. Not only that but the workmanship of the rest of the automobile was of a sturdy manufacture. In those earlier days, the ordinary motorist was able to perform his own repairs but today, the mechanism of a car is so complicated that a person has to use wrenches and screw drivers that turn around corners.

At this committee hearing Sen. Robert P. Griffin (R. Mich.) interjected this committee does not grovel and he informed Mr. Nader he does not need to use such statement to get attention. No wonder Sen. Griffin made this statement, he hails from the motor state of Michigan.

Respectfully yours,

GEORGE VERNAL.

MAY 11 1971

DEAR MR. NADER:

Read how you ~~steamed up the senators~~

Well, all I have to say is

Those Senators ~~in the Senate~~

They didn't care if we ~~lost~~

Those auto manuf ~~urers~~

They're interested in ~~the money~~

But you, who are ~~being~~

And doing what it is ~~to do~~

Are being maligned and falsely accused
 and what is more, verbally abused!
 Shame on them all!
 Don't they know that
 The public is fed up? So
 Keep on shouting loud and clear
 Until those bigwigs begin to hear!
 NEW CAR OWNERS ARE ANGRY!

U.S. DEPARTMENT OF TRANSPORTATION,
 NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION,
 Washington, D.C., April 23, 1971.

Mr. RALPH NADER,
 1719 19th Street N.W.,
 Washington, D.C.

DEAR MR. NADER: Mr. Toms and I thoroughly discussed your letter of April 20 relative to bumper costs discussed in last week's press conference. He asked that I respond.

Mr. Toms and several of the NHTSA staff have examined the 1973 and 1974 bumper devices presently developed by Detroit's big four. In the demonstrations there were detailed discussions as to cost, added retail cost, etc. Many configurations examined were openly labeled as to cost, and the range was considerable. As you point out in your letter, cost variations relate to the model, to the manufacturer, to offsetting design savings and to a host of other factors.

In the press conference Mr. Toms was strongly urged to discuss these costs and he did so, stating he would be "guessing." As stated at the conference, consumer costs have been estimated to us in amounts ranging from \$5 upward. Mr. Toms' guess as to the average was \$40.

Since these figures did come from the manufacturers and do represent their own claims of production-plus-markup costs, there is little more substantiation we can provide. We agree with your contention that it would be inappropriate for the NHTSA to estimate consumer cost on its own. It is appropriate that we substantiate manufacturer cost to the extent possible, and we will be doing so.

Sincerely,

GILBERT L. WATSON,
 Chief, Consumer Affairs, NHTSA.

APRIL 20, 1971.

Mr. DOUGLAS TOMS,
 Acting Director, National Highway Traffic Safety Administration, Department of Transportation, Washington, D.C.

DEAR MR. TOMS: Once again, your office has publicly estimated the added cost to the consumer of a proposed federal regulation (exterior protection). I am interested in knowing why you think it is appropriate for the Bureau to estimate the cost (added price) to the consumer when the presumption should be that figure is determined by market competitive factors which alleged competition should establish independently and, presumably, differently—i.e., some companies could absorb any added cost, have it displaced by other cost reductions, etc. To have the Bureau make this estimate is a presumption against the consumer. Have you asked for an evaluated cost information on bumpers from the companies? It would be more appropriate for the Bureau to estimate production cost to the manufacturers and leave the markups to the different companies. What is your opinion?

This is to request that you provide factual substantiation for the figures given by the Safety Administration at last week's press conference as to the estimated added cost to the consumer of the new bumper standards.

Thank you.

Sincerely,

RALPH NADER

APRIL 4, 1971.

STATEMENT BY RALPH NADER ON DOT EXTERIOR PROTECTION (BUMPER) STANDARD

There are five major deficiencies in the standard issued today by the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) on exterior protection (bumpers). Most important, the "protection" provided by this standard is for automobile exteriors, not for the vehicle occupants or the pedestrians who continue to be killed and maimed in record numbers.

1. Each year, more than 10,000 pedestrians are killed and tens of thousands injured by hostile vehicle exteriors. Many of these injuries are seriously aggravated by these sharp, slashing points and edges. The NHTSA first proposed a standard for pedestrian protection in 1967, but it has yet to be issued. Absent any government requirement to date, the auto manufacturers have refused to design the vehicle exterior to minimize injury to pedestrians. Obviously, they know how to do it and it would reduce costs as well. But, a recent General Motors Chevrolet Monte Carlo advertisement callously boasted: "We added a raised hood ornament."

What more is needed to convince the Department of the need to eliminate protruding and sharply-contoured bumpers and other harmful ornamental designs? No research and development are needed. Cost savings could be realized with the deletion of expensively sculptured bumpers, fenders and grills. Yet the Department of Transportation perennially fails to act.

The ridiculous distinction now made between injury protection and property damage reduction should be eliminated with amendatory legislation requested by the DOT immediately. The solutions to these problems are not only compatible but interdependent, and should take priority in manufacturing expenditures over the stylistic demons now produced by the auto companies.

2. In unconscionable capitulation to the auto manufacturers' pressure, the NHTSA has designated the level of protection for rear bumpers at half that required for front bumpers. The proposed standard contained identical five m.p.h. speeds for both. As the Insurance Institute for Highway Safety has pointed out, General Motors' argument for this change was based on its MIC data of front and rear bumper damage experience, which General Motors misrepresented by omission. The MIC data covers only collision damage insurance, or insurance for the striking vehicle, and most of these claims naturally concern vehicle front ends.

As General Motors boasted in 1969 congressional testimony their vehicles at that time could already withstand a 2.8 miles per hour pendulum test both front and rear. Thus, the Bureau's standard for 1973 models contains virtually no improvement in the rear bumper crash protection over 1970 and perhaps earlier General Motors vehicles.

3. The list of vehicle equipment and operating systems whose functions shall not be impaired as specified in the standard does not include the following crucial items: brakes, steering, tires, and turning radius.

4. Comments to the Department of Transportation suggested that the standard require minimum trailer hitch retention capability in the rear bumpers. A recent letter from a county coroner in Illinois documented actual serious crashes and injuries incurred when the rear bumper separated from the Mustangs, Cougars and Camaros pulling a trailer. This proposal was ignored, even though thousands of trailers pulled by passenger cars via weak rear bumpers are on the highways.

5. This minimal standard provides the manufacturers with the best of both worlds. They have already used it as a threat to dramatically raise vehicle prices, heaping the blame on the government, and at the same time it does not require significant upgrading of current designs. Thus, the new-car buyer will not only pay more initially, but will continue to pay outrageous repair costs, which for 1971 models ranged up to \$445 (Chevrolet Impala) for a five mph rear-end crash (documented by the Insurance Institute for Highway Safety).

'71 Monte Carlo. Changed? No, refined.

For '71 Monte Carlo remains much the way it was.

Because most people liked it the way it was.

A lot of research told us that. Along with a lot of sales, thank you. So, no big change. Rather, some small, but nice, improvements.

We replaced last year's grille with one having an even more classic grid pattern.

We widened the distance between the Power-Beam headlights, so the car assumes a slightly lower stance. We added a raised hood ornament.

Inside, we took last year's control knobs and wrapped them in soft black vinyl. They look better. They feel better.

But like we said, most people liked our Monte Carlo the way it was. So it still has steel guard beams built into the doors

and a steel bulkhead in the trunk. Still has power disc front brakes. And what people like best of all, it still has a Chevrolet price.

Actually, Monte Carlo hasn't changed one bit from what you wanted it to be. A person of luxury car priced hundreds of dollars less than other personal luxury cars.

A whole new field of

1971. You've changed. We've changed.

Monte Carlo

FEBRUARY 8, 1971.

Mr. HENRY FORD II,
Chairman of the Board,
Ford Motor Co., Dearborn, Mich.

DEAR MR. FORD: For years the egregious blunders, callousness and greed of your giant co-conspirator against the consumer-citizen—General Motors—have served to deflect attention from your modest corporation's performance. This giant buffer of a General Motors has permitted you many excesses and few public responsibilities. You have spent much time at European auto races, but no time at a single auto safety or pollution conference in Detroit or elsewhere. You watched the resignation of many of your more perceptive executives for want of a challenge, such as Donald Frey and Arjay Miller, while you elevated that socially insensitive corporate Mustang—Lee Iacocca—to the Presidency. You traveled to Washington many times to privately lobby Presidents and their cabinet but declined ever to testify publicly before Congress on your company's involvement in highway casualties and pollution. You spoke of the need for law and order while your lawless company violated federal and local laws around the clock.

Isn't it time you began paying close attention to your cars? Perhaps the following list of items will help convince you that Ford Motor Company, in addition to sharing common deficiencies with the rest of the auto industry, goes well below common denominators in important areas.

1. In the recent compilation of consumer information braking performance of 1971 passenger cars supplied by the auto manufacturers to the National Highway Traffic Safety Administration under the 1966 safety law, Ford vehicles dominated the *lowest* ranking automobile brake stopping capability. In the bottom eight out of seventy-four rankings, eleven of the thirteen model vehicles were Ford-manufactured. Your company's dealers are reluctant to supply customers with this notorious record which the law requires them to make easily available at the showrooms and to supply with every new vehicle. This is the second year in a row that such Ford braking performance dominated the lowest rankings. How many years does it take for Ford to get a better idea?

2. Your \$12 billion a year company cannot apparently build bumpers as protective as they were on your grandfather's automobiles. Picture the brave horizons described by your representative in an official company comment on the federal government's weak bumper standard proposal to go into effect August 1972. Objecting to the weak federal proposal for bumper protection front and rear from damage to vital car system, Ford Motor Company demanded a one year extension—to 1973—and a dilution of rear bumper protection down to the two mph level. The company stated it could do no better. This is a shameful exercise in deceit and prevarication. A five mph bumper is clearly not one of the latter twentieth century's major technological challenges. It would, however, save motorists one billion dollars a year in prevented damage to vehicles.

3. It would be helpful in leading your company to read its official statements before disgorging your colloquialism. On August 22, 1969, the *New York Times* reported that Ford engineers declared the air bag will be introduced on a 1971 Mercury model car. On December 3, 1970, Ford Motor Company filed a petition for reconsideration of DOT Standard 208 involving passive restraint systems to be installed on the 1974 models. The statement asserted: "We believe in the potential of the air bag system of passive restraint and, as a result, have committed substantial effort to the development of the system." But on December 10, 1970—a week later—the *New York Times* and the *Detroit News* reported you as asserting "We think those air bags are a lot of baloney" in reference to the government's proposals. Who speaks for Ford Motor Company, Mr. Ford?

4. Over 4 million Ford owners are driving certain Ford, Mercury and Thunderbird models 1965 to 1969 with defective lower control arms. In August of 1970 your company agreed to recall, for replacement of the lower control arms, approximately 85,000 Ford manufactured vehicles sold for police use over the past five years. You refused to recall the remaining 4 million cars with identical prone-to-collapse lower control arms on the grounds that these cars are not driven as hard as police cars. This decision will eventually involve your company in vast litigation by injured and class action plaintiffs and increasing pressure from government to recall. So, why not recall now?

'71 Monte Carlo. Changed? No, refined.

For '71 Monte Carlo remains much the way it was.

Because most people liked it the way it was.

A lot of research told us that. Along with a lot of sales, thank you. So, no big change. Rather, some small, but nice, improvements.

The company stated it could do no better. This is a shameful exercise in deceit and prevarication. A five mph bumper is clearly not one of the latter twentieth century's major technological challenges. It would, however, save motorists one billion dollars a year in prevented damage to vehicles.

3. It would be helpful in leading your company to read its official statements before disgorging your colloquialism. On August 22, 1969, the *New York Times* reported that Ford engineers declared the air bag will be introduced on a 1971 Mercury model car. On December 3, 1970, Ford Motor Company filed a petition for reconsideration of DOT Standard 208 involving passive restraint systems to be installed on the 1974 models. The statement asserted: "We believe in the potential of the air bag system of passive restraint and, as a result, have committed substantial effort to the development of the system." But on December 10, 1970—a week later—the *New York Times* and the *Detroit News* reported you as asserting "We think those air bags are a lot of baloney" in reference to the government's proposals. Who speaks for Ford Motor Company, Mr. Ford?

4. Over 4 million Ford owners are driving certain Ford, Mercury and Thunderbird models 1965 to 1969 with defective lower control arms. In August of 1970 your company agreed to recall, for replacement of the lower control arms, approximately 85,000 Ford manufactured vehicles sold for police use over the past five years. You refused to recall the remaining 4 million cars with identical prone-to-collapse lower control arms on the grounds that these cars are not driven as hard as police cars. This decision will eventually involve your company in vast litigation by injured and class action plaintiffs and increasing pressure from government to recall. So, why not recall now?

5. The following description of a serious crash comes from Vernon Von Qualen, coroner, Livingston County, Illinois, who completed a detailed inquest:

"On July 13, 1970 one man was killed and 3 persons were seriously injured on U.S. Route 66 here in our County. A 1970 Mercury Cougar automobile pulling a U-Haul trailer was traveling northbound on the highway, which has two lanes in each direction separated by a median strip. The bumper tore loose from the Cougar, causing the U-Haul trailer to careen across the median strip and onto the southbound lanes of traffic, striking a southbound automobile and causing death to one and injury to 3 others, all innocent victims of circumstance.

"Investigation showed the trailer hitch had remained securely fastened to the bumper and that the *actual bumper* tore loose from the car. Closer inspection revealed the metal brackets holding the bumper to the car to be of an extremely light weight quality."

Mr. Von Qualen also investigated a crash involving a 1966 Mustang whose rear bumper tore loose thereby releasing a U-Haul trailer and almost causing another serious crash.

It would seem that such careful investigations as conducted by Mr. Von Qualen be a sufficient prod for your company to rectify all such design deficiencies and to recall any such vehicles for correction before more crashes occur.

The above items are a few of many such situations particularly affecting your company which should be given the top level attention and action that only you can provide. It is time Mr. Ford for you to devote such concern and meaningful scrutiny to such problems. It is well known in your organization that vertical lines of communication up to your office about safety and pollution problems have neither been candid nor reliable. Somehow you must establish in your office the staff capability to reach deep into your company and obtain the necessary facts that will invoke your personal responsibility to bring about improvement.

Sincerely yours,

RALPH NADER

The new Eldorado... the world's most elegant personal cars.

In the Eldorado Coupe and Convertible, Cadillac presents two completely new and completely distinctive automobiles. A new, longer wheelbase provides superb riding qualities and new, more impressive beauty.

Individual touches, such as the jewel-like stand-up crest and the exclusive coach windows on the Coupe, typify the Eldorado's many styling innovations.

The Convertible, now the only luxury convertible built in America, comes equipped with an ingenious new inward-folding Hideaway Top. It provides a more

graceful top-down appearance and allows greater room for rear-seat passengers.

Both Eldorados share the same 8.2 litre V-8 (the world's largest production passenger car engine) in combination with the precise handling of front-wheel drive, variable-ratio power steering, power front disc brakes and Automatic Level Control.

Surely, these are the two most excitingly luxurious automobiles in the world of personal motoring... the Fleetwood Eldorados by Cadillac.

New Look of Leadership

INSURERS AND STATE REGULATIONS PUT DETROIT ON THE CARPET

(By John Kolb and Michael Sheldrick)

And the auto makers are listening. They agree in principle to demands for a system that would rate cars' crashability and repairability

In their demand for a safer, more rugged automobile, the consumer movement and the federal government are getting a formidable ally: the insurance industry. And the auto manufacturers seem to be listening with new respect.

At its semiannual meeting last month in Chicago, the National Assn. of Insurance Commissioners (NAIC), made up of state insurance regulators, invited a confrontation between the Big Three auto makers on the one hand and representatives of the insurance industry on the other hand. Stanley DuRose, NAIC vice president and insurance commissioner of Wisconsin, also invited people from the auto unions and the U.S. Dept. of Transportation.

The first surprise was when all three auto companies showed up. The second was when they unanimously accepted a suggestion made forcefully by insurance representatives: that an index of relative repairability be worked out for each auto design, as a basis for setting insurance rates and for comparison shopping.

LAYING IT ON THE LINE

It was clear from the outset that the state superintendents of insurance and the insurers themselves intend, one way or another, to force Detroit to make cars that will withstand crashes better and be less expensive to repair after an accident.

DuRose opened the meeting by insisting on development of indexes for crashability (ability of a vehicle to withstand physical damage) and repairability (the ease of restoring a vehicle to operation). "The public today is transported in eggshells," he said. An insurance industry representative offered another figure of speech. "Peanut brittle on wheels," he called present-day automobiles.

Other proposals for penalizing fragile design included a system of surcharges on auto insurance premiums for aspects of design that add to repair costs and of discounts for what the insurance industry would consider improved design.

SWALLOWING THE IDEA

The auto men almost sheepishly accept the principle of a rating system for crashability and repairability, and Don Seagrave of American Mutual Insurance Alliance chortled, "We've got them on the run, and we're going to force them to build better cars." In the face of the chorus of criticism, the harried auto industry representatives adopted a conciliatory tone.

"The idea of a rating system is appealing and will be welcomed by us," said John Bates, director of the service section of General Motors. Magnus Von Braun, director of Chrysler's service section, declared, "We endorse the action by the insurance industry." He added, however, that he hoped insurance industry action wouldn't conflict with the auto companies' dealings with the Dept. of Transportation. Finally, Richard Lindgren, Ford Motor's director of marketing operations, made it unanimous by saying, "We recognize the need for an index."

NEW BASIS OF PREMIUMS

In his opening, DuRose declared that autos today are designed for "ease of assembly rather than repairability." And it is very difficult, he said, to tailor insurance rates to various types of autos, even though one might be easier to repair than another. "Values are determined only on the basis of price," he noted.

"What we really hope to do," DuRose explained, "is to develop a rating index whereby an automobile purchaser could possibly determine what he will have to pay for automobile insurance in view of the delicacy and/or ruggedness of his vehicle, and how difficult it is to repair."

Richard Savage, representing a group of insurance rating boards, said he was not in favor of NAIC's coordinating the effort to create an index, as DuRose had suggested, but he endorsed the concept of an index. He also suggested another way insurance companies could force the auto makers to dispense with poor designs: simply get approval for higher rates on such cars.

Savage cited the wraparound windshield as an example. The great number of insurance companies seeking higher rates—and getting them—on cars so equipped led to abandonment of the wraparounds by the auto companies, he said. He also pointed to the higher rates that insurance companies have obtained for so-called high-performance cars.

MEASURING DAMAGE

Arthur Mertz, vice president and general counsel of the National Assn. of Independent Insurers, said his group had been working with Cornell Aeronautical Laboratories in attempting to predict the damage susceptibility of autos. Two situations were chosen: 5- and 10-mph impacts into a rigid pole. Mertz said predictions were highly accurate at 5 mph but erred on the low side at 10 mph. The Cornell lab hopes to refine some of the work, he said, and publish it early next year.

A spokesman for Allstate said: "What we're trying to develop here is a tool that will permit us to exert discipline on auto manufacturers and force them to design better cars."

WHAT NEXT?

No definite plan of action emerged from the meeting, but insurance people seemed please. "We've got the auto companies listening now," one said. "We've never been able to do that before." Another insurance company spokesman added: "This is all because of Ralph Nader. We could have done all of this 20 years ago ourselves."

PRODUCTION MACHINERY, TOO

The insurance industry is also reexamining its methods of evaluating the hazard potential in manufacturing equipment and processes. It is under pressure from still-increasing product litigation and the inability of the nation's workmen's compensation system to pay the costs of injuries caused by design and manufacture defects in production machinery.

Whereas the compensation system formerly covered workers' claims for injury, workers increasingly are suing manufacturers of the equipment allegedly responsible, and these manufacturers are the insurance companies' policyholders. At least some segments of the insurance industry seem to be reconsidering their relationship to the annual increases in accidental deaths and disabling injuries in industrial work.

Among the kinds of action being taken by insurance companies in relation to autos, industrial machinery, and even some consumer products are such safety-oriented aerospace disciplines as systems safety engineering and human factors analysis. These are being applied as a possible means of evaluating hazard potentials in designs of products that carriers are being asked to insure against product liability claims. Included so far are power tools, home appliances, and outdoor power equipment.

ENERGY-ABSORBING SYSTEMS VIE FOR ROLE BEHIND AUTO BUMPERS

(By Nicholas P. Chironis)

The race is on for the lucrative business of providing absorbers for bumpers. Winning design will have to be ingenious, inexpensive.

The auto industry is coming under intensifying pressure to provide cars with bumpers that minimize injury and property damage in collisions. A big push has been launched by the insurance industry, which wants to reduce an annual \$3.8-billion property loss from low-speed collisions (page 37). Allstate and two other companies have offered a 20% reduction in collision premiums on cars that can withstand 5-mph impacts, front and rear, without damage.

The National Highway Safety Bureau is working on bumper standards. Legislation is pending in Congress and nine state legislatures that would require cars to be able to stand up under a 5-mph impact (the Florida bill calls for a 10-mph capability).

Auto manufacturers can read the signs of the times. Ford Motor Co. is looking closely at two energy-absorbing designs (drawings), one by Tayco Development Inc., a subsidiary of Taylor Devices Inc., North Tonawanda, N.Y., and the other by Menasco Mfg. Co., Burbank, Calif. General Motors Corp. has started a test program and is reported analyzing a system by Houdaille Inc.

So the battle of the bumpers is on. Before it is settled, many more designers of energy-absorbing systems will be throwing their sketches into the ring.

BEHIND THE BUMPER

Improvements in bumpers themselves will involve the bumper face, making it wider, thicker, and with about twice the present yield strength. Shapes will be confined to certain structural configurations, without unnecessary curves and cutouts, and bumpers will be set at standard heights to avoid mismatching that allows override and underide.

All this is relatively simple to carry out. The crucial factor will be the choice of energy-absorbing system to put behind the bumper.

A plain coil spring system, even combined with a hydraulic shock absorber as in conventional wheel suspensions, has little chance of doing the job. Computations show that the spring would have to compress almost a foot for a 20-mph collision—and this distance is in addition to the solid length of the coil itself. Moreover, with coil springs the resisting force climbs steadily with deflection, inducing high propelling forces on a passenger during a collision.

LIQUID-SPRING SYSTEMS

Both the Tayco and the Menasco systems, therefore, have gone to liquid-spring designs, but with certain key innovations.

Conventional liquid springs are simple closed cylinders with moving pistons; the resisting force is created by passage of liquid around or through the piston head.

The Taylor liquid spring (PE-Jan. 1'68,p45), built by Tayco's parent company, uses a tapered metering pin entering a variable-diameter orifice, along with a pressure-responsive valve, to amplify motion so a more constant resisting force with the motion—approaching the so-called square-energy curve—can be obtained. This square-energy response is highly desirable for auto bumper applications, to prevent a high buildup of shock force.

The Taylor springs also employ a partially compressible liquid (a silicone oil that can be compressed to about 85% of its original volume). Such liquid springs are already in use on railroad and automotive wheel-suspension systems, where they replace both the coil springs and the shock absorbers.

FLUID-AMPLIFYING FEATURE

The Tayco system being evaluated by Ford (and reportedly also by Chrysler Corp. and American Motors) goes one step further. It combines the Taylor liquid-spring principles with a newly developed fluid-amplifier concept that flattens the curve of resisting force to the same characteristics as those obtained with collapsible auto frames.

The fluid-amplifying concept applies the same principle as that demonstrated in blowing across the top of a tube immersed in water: the higher the air velocity, the greater the amount of liquid entrained. It amplifies the flow around the liquid spring's piston, matching the flow rate more closely to the piston velocity and thus flattening out the force-stroke curve (graph).

The pressure-responsive valves are dropped from the system when the amplifier cutouts are put in. "We found that at high impact speeds the pressures were 20 times those of conventional shock-suspension conditions," says Paul H. Taylor, president of Taylor Devices. "This theoretically called for valves larger than the liquid spring itself."

FOR HIGHER-SPEED IMPACTS

Tests by Taylor Devices show remarkable impact capability for Tayco's system.

"Although the specifications enacted by some states and announced as a goal by the federal government only require damage-free impact operation to 5 mph in 1973 and 10 mph by 1975," says Taylor, "Tayco Development has built a shock-absorbing device with only a 9-in. stroke yet that will cushion and prevent damage to 5300-lb. car striking a solid barrier at 26.7 mph. This system will thus protect two cars similarly equipped and smashing into one another head-on at a closing speed of 50 mph or more."

Tayco's system has four parallel cushioning units mounted behind the bumper. Realizing that the 9-in.-stroke device may present problems in parking and ga-

raging. Taylor points out that another company product, the Linear Accelerator Shok, remains retracted until needed, then shoots out 9 in. in milliseconds to cushion an impact, under control of an impact sensor such as that in the expanding air-bag systems being considered.

COMPETITOR

The Menasco system (PE-Apr.27'70,p164) is also based on liquid springs, but a highly compressible silicone rubber plays a key role. At the extremely high pressures encountered, the rubber behaves like a liquid. But, unlike a liquid, it's a solid material with no problem of leakage, with need only for simple seals, and with no effect from normal temperatures. It requires no maintenance.

Most of the impact energy in a crash is absorbed by the rubber's resistance to flow. As the piston is driven by impact, the rubber is reduced in volume and is forced through orifices. Under pressure reaching 40,000 psi, the rubber stores energy that causes the material to reenter the isolator cavity when the pressure is removed, returning the piston to its original position.

INSIDE-OUT TORI

In the Tor-Shok system, ARA Products Inc., West Covina, Calif., found an ingenious way to get an almost constant resisting force from a coil spring. This candidate for use in auto bumpers is already serving in energy-absorbing guard-rails at key highway locations (PE-Apr.27'70,p164).

In the Tor-Shok, a helically wound coil spring is forced to act as a series of tori as it rolls inside out under the action of telescoping tubes. The coil, made of stainless steel wire in the annealed "dead soft" condition, is installed with what amounts to a press fit between the cylinders.

The press fit prevents the torus from sliding during actuation of the device as one cylinder is forced within the other. Instead, as the torus rolls, all points on the inner diameter move to the outer diameter, causing a vigorous stretching action. Simultaneously, the outer points move to inner position, causing a shrinking action. This plasticizes the metal, dissipating the kinetic energy of the impact force in the form of heat.

Ford Motor Co. has bought an interest in ARA Products.

OTHER SYSTEMS

The Houdaille system is described as having spring-steel columns that bow under impact and then resume normal position after a collision. In such a system, the energy is merely stored and then released, not dissipated. Another all-metal spring system—but one in which energy is dissipated—is the reverse-coil spring developed by Jet Propulsion Laboratory (page 86).

A safety car designed for very high speeds by Fairchild Hiller Corp.'s Republic Aviation (PE-June '68, p. 43) has a bumper system that is hydraulically extended farther and farther forward as the car picks up speed. The idea is to provide ample deflection capabilities without unduly lengthening the car while it is stationary or moving slowly.

Other shock-absorbing concepts on which Detroit designs will be based include frangible aluminum struts and collapsible car frames, both as means of augmenting the energy-absorbing bumper system.

THE GREAT ODOMETER RAID

In which the forces of consumer protection triumphed over the deceivers, thereby demonstrating that law enforcement is possible, even on used-car lots

Last summer, 12 investigators from the Massachusetts Attorney General's Division of Consumer Protection made consumer protection history. They staged an odometer raid.

The plan of attack was simple. Working in pairs, the investigators fanned out through the Commonwealth, selected 24 new-car showrooms at random, sauntered in, flashed their badges, and said they were conducting a "routine check" of cars on display in the dealers' used-car lots. For the next several hours they inspected hundreds of used cars and pored over dealers' records for possible evidence that odometers might have been rolled back from original trade-in mileages to lower, more salesworthy figures. Mainly on the basis of educated guesswork after com-

paring the odometer readings with the appearance of the cars; the investigators listed about 250 vehicles open to suspicion of odometer tampering.

The next step was to try locating the former owners of the suspect cars. About 70 per cent of the owners could not be traced at all because the dealers had purchased the cars from wholesalers, or because former owners couldn't be located. A few former owners, when located, refused to cooperate. But 70 persons did reply to the inquiry, and 20 of them said the reading on their odometers when they traded in their cars was much higher than the readings found by the inspectors. On average, between 20,000 and 30,000 miles had been subtracted. One man said his odometer reading had been pared from 80,000 to 45,000 miles.

PENANCE OF A SORT

Assistant Attorney General Robert L. Meade at length decided he had strong cases against six of the biggest new-car dealerships in his state. Massachusetts is one of four states with "little FTC laws" patterned on the antideceptive practices provisions of the Federal Trade Commission Act (the others are Washington, Vermont, and Hawaii). Acting under his state's laws, Mr. Meade succeeded, after several months of polite arm-twisting, in convincing three of the dealers to sign an assurance of discontinuance. That meant, simply, that they filed in Superior Court an agreement saying the would not offer "for sale any vehicle upon which the odometer has been adjusted in any manner . . . so that it does not disclose the . . . true mileage. . . ." As in consent orders filed with the FTC, assurances of discontinuance in Massachusetts are carefully worded so that the signer does not admit to having used certain specific deceptive sales practices in the past, but, nevertheless, agree *not* to use the same deceptive practices in the future.

Those who signed were Charles Chevrolet, Inc., and The Harr Motor Co., both of Worcester, and State Plymouth, Inc., of Springfield. At this writing, the state was still negotiating with two of the other dealers. Mr. Meade took sterner action against the sixth dealer on his list, North Ford, Inc., of West Medford. Saying it had flatly refused to cooperate, he filed suit for permanent injunction against North Ford.

All things considered, the Great Odometer Raid might have been a very bitter pill, indeed, for any auto dealer to swallow had it not been for a high-level decision to sugar-coat the pill with secrecy. As far as CU has been able to learn, little news of the raid ever reached the people of Massachusetts. The Attorney General's office could have given the names of the dealers to the newspapers, but it decided not to—this time. The only excuse offered by a state official was that it would have been "unfair to ruin these guys when everyone else is doing it, too." Of course, the names of the dealers thus far cited went into public court records (where CU eventually looked them up). But by not alerting the press, the state deprived itself and the public of a most effective enforcement tool in consumer protection cases—the glare of publicity.

Nevertheless, the Massachusetts Division of Consumer Protection deserves some credit for the first organized attempt to stamp out the ancient, odious and widespread practice of odometer tampering. And, Mr. Meade assures us, it won't be the last assault on what is, regrettably, a standard operating procedure of many used-car dealers, who know perfectly well that a high-mileage car is nothing but a drag on the market.

PICKERS AND SPINNERS

Technically speaking, odometer tampering is all too easy to do. The favorite technique in the trade is called "picking" because most operators use a home-made assortment of specially shaped ice picks. With a certain degree of skill and a modest capital investment, an odometer picker earns anywhere from \$3.50 to \$25 a car. The procedure takes only a few minutes. The picker simply reaches into the odometer drum—after first removing the instrument panel lens or boring through a partition behind the speedometer—and manipulates the digits mechanically, usually only the ten-thousandth place. If the picker is skilled, his handiwork is rarely detectable by a used-car shopper.

With less skill but much more patience, an odometer tamperer can spin the speedometer cable with a high-speed electric motor to the desired low reading. But since it can take hours to spin off just a few thousand miles, spinning is most commonly used by the amateur.

The simplest way to falsify an odometer is by disconnecting the speedometer cable. Dealers will sometimes do that on a new car to be used as a demonstrator or to be driven cross-country to the point of sale. In California last year a fairly strict state law against odometer rollbacks was weakened by an amendment expressly permitting dealers to reset new-car odometers at zero, provided they give the buyer a statement of the true mileage. But law or no law, you can't always be certain that the mileage on the odometer of a "factory-fresh" car recounts its true history.

Wisconsin requires that the odometers on all used cars be reset at zero. Arizona tried that, too, then changed its mind (CONSUMER REPORTS, June 1968). And in Florida dealers are permitted, but not required, to roll odometers back to zero. The idea is fine, of course—for the dealer. He can then disavow any knowledge of a car's true mileage and still be on the side of the angels. But the car buyer is deprived of the only base he has on which to add mentally the 20,000-or-so miles the dealer has subtracted mechanically. In states where antitampering legislation is pending, the back-to-zero idea is apt to be pushed hard by the dealer lobby.

Besides California, only Delaware, Kentucky, Massachusetts and New Jersey have laws making it illegal to tamper with an odometer. Several other states, including Hawaii, Maryland and Georgia, have similar laws under consideration. Unfortunately, state laws specifically aimed at odometer rollbacks are generally regarded as difficult to enforce and are therefore rarely invoked. "In order to convict under these statutes," says Paul J. Krebs, director of New Jersey's Office of Consumer Protection, "you practically have to catch these guys in the act."

Bearing him out, Massachusetts chose not to use its criminal statute against odometer tampering to prosecute suspects in the Great Odometer Raid. Although enforcement under the state's little FTC law provided possible, the act provides for no fines to penalize violators and no redress for victimized consumers unless they can sue privately and win an award for damages. The legislature is considering an amendment with stiffer penalties, but meanwhile the most the Attorney General can do is get an injunction ordering the unrepentant violator to stop his fraudulent practices. That has more muscle than an assurance of discontinuance, since anyone in violation of a court injunction is also in contempt of court.

WHO GYPS WHOM?

Massachusetts' Assistant Attorney General, Mr. Meade, while pleased at the results of his raid, asks, "Why hasn't the Federal Trade Commission itself declared odometer tampering an unfair trade practice?" He argues that the problem is, after all, interstate in scope, since so many used cars are sold to wholesalers, particularly in the South, and then auctioned off to dealers from all over the country. Therefore, the solution must be national in scope. The FTC, on the other hand, told CU the agency views odometer tampering in used cars as primarily a local rather than an interstate problem.

"We have no evidence to support the idea that it is being done by the wholesaler," said an FTC attorney. "If we did, we'd certainly investigate, but in my opinion, it's done at the retail level, the level at which the automobile is sold to an unsophisticated buyer. The wholesaler would have nothing to gain by resetting an odometer. He's certainly not going to fool the dealer, who doesn't buy on the basis of the odometer reading, anyway."

Still, he was willing to make at least a hypothetical concession: "I could visualize a dealer requesting the wholesaler to turn back an odometer for him, especially if it's illegal in his state, and I'm sure the wholesaler would do it. But, as I said before, we have no information on this."

Perhaps FTC doesn't, but evidence of a sort is apparently plentiful right across the Potomac River from Washington. The office of Virginia's Senator Harry F. Byrd, Jr. told CU: "The Automobile Trade Association of Virginia tells us that 90 per cent of all odometer rollbacks are done by wholesalers. They say it's a routine part of the 'reconditioning' process. Naturally, the dealer doesn't pay any attention to the odometer reading; he only buys a car on the basis of what he thinks he can sell it for. And when he buys from a wholesaler, he knows he is getting a product he can palm off with little or no risk because the former owner will be very difficult to trace."

The dealer can blame the wholesaler, and the wholesaler can blame the dealer, but it's obvious that neither could tamper with odometers on any large scale basis without the direct knowledge or the implied consent of the other. Few swindlers, after all, fall for their own swindle.

Senator Byrd has therefore taken up the cause of a Federal law against odometer tampering. The Byrd bill (S. 1185) would make odometer tampering subject to a stiff fine. It would also require used-car dealers to give their customers a statement signed by the last *private* owner of the vehicle certifying the mileage that was on the car when he sold it. Meanwhile, on the other side of the Hill, New Jersey Congressman Henry Helstoski has resubmitted his bill of last year (H.R. 4163), also prohibiting odometer tampering in interstate commerce. The chances for passage of either measure during the current session of Congress may be hard to assess, but it's not very encouraging to note that, even in the proconsumer atmosphere of the previous Congress, a bill sponsored by Senator William Proxmire to require auto manufacturers to install tamper-proof odometers in all new cars died in the Senate Commerce Committee.

The need for effective legislation is obvious. Norman Polovoy, chief of the Maryland Consumer Protection Division, puts it this way: "I know of no rational or reasonable justification for an automobile dealer setting the odometer back other than to try to convince the purchaser that the automobile has substantially less mileage on it than is in fact true."

According to one report, in 1967 alone Americans bought nearly 20 million used cars and paid an estimated \$20 billion for them. The trade journal *Automotive News* reports that prices start falling off sharply after a car has traveled 30,000 miles and beyond that distance, a two-year-old car loses about \$10 of value for every 1000 miles on the odometer. Assuming that only half the used cars sold in 1967 were two years old or older, and that only half of them had 20,000 miles picked or spun off their odometers, it doesn't seem unreasonable to estimate that consumers are being misled on used-car lots to the tune of \$1 billion a year.

But the cost must be assessed in terms of safety as well. Even with the best of care, a car with 75,000 miles on the odometer is not the car it was at 25,000 miles. The prudent owner knows this and is less likely to take his steering or wheel bearings or exhaust system for granted. But the owner of a "low-mileage" used car may be lulled by the odometer. Until the critical moment, he may have been completely unaware that his car was dangerously in need of repair—a menace to himself and to others.

The National Highway Safety Bureau agrees, and in 1967 it proposed a safety standard requiring tamperproof odometers on all passenger vehicles, including buses, trucks and motorcycles. The idea was assigned to an administrative pigeon-hole, however.

"Other proposed safety standards had a higher priority," a bureau spokesman told OU, "but this is not to say we won't have such a standard later on."

WHAT'S TAMPERPROOF?

But at the same time, the bureau questions whether it is possible to design a really tamperproof odometer, and except for General Motors, the auto industry has yet to market anything resembling one. GM's 1969 models have odometers that cannot be spun backward. But there is no way for the used-car buyer to detect whether the mileage reading has been spun forward beyond 99,999.9 to zero and then to some youthfully low second-time-around setting. Also, in GM cars made after January 1, the odometer will exhibit a telltale color separation between the numbers if it has been picked. But a GM spokesman admits, the buyer would have to be "a knowledgeable individual" to recognize the evidence. Despite those refinements, the new GM odometer cannot therefore be described as truly tamperproof. And whatever its positive virtues, the GM odometer will be of little use to the buyer of a used *Ford*, *Plymouth*, *Ambassador*, *Volkswagen*, etc., or, for that matter, to the buyer of a pre-1969 GM model.

CU's automotive engineers give a qualified Yes to the question of whether a tamperproof odometer is feasible. While anything Yankee know-how can put together, Yankee know-how can probably take apart, our engineers say a much less accessible odometer unit, one sealed in plastic perhaps, is certainly possible. But for the unit to be completely tamperproof, the speedometer cable would have to be sealed in two places—where it connects with the speedometer head and at either the transmission or the front wheel connection, depending on the car. (Some car rental companies seal odometers, for obvious reasons, and a spokesman for one of the biggest says sealing is highly effective.)

What about repairs? Would it be possible to fix a broken but tamperproof odometer or install a new one without breaking the seal? Probably not, but mechanics could be required to reseal the unit and verify the original mileage. Enforcement might be difficult—but no more impossible than any other weights-and-measures regulation. If it is important to protect the consumer from the butcher who cheats a few cents on the hamburger, it's at least as important to protect him from the odometer "artist" who chisels a few hundred dollars on a used car.

TITLE LAWS

Title registration laws could help, too, and 31 states already have them. Not only are they an effective weapon against auto theft, they also assure the car owner a clear title to his automobile by requiring that the chain of ownership be established to the satisfaction of motor vehicle authorities. (And possibly the mileage to the satisfaction of the consumer; see box above.) Such a title law is pending in Massachusetts, but the Massachusetts Consumers Council further proposes that the identity of the former owner become a part of the certificate of title the state gives the new owner. But even if the measure sailed through the Massachusetts legislature, it would be truly effective only if most other states passed similar laws.

It will be difficult but not impossible to make the used-car mile more nearly approximate the statute mile. For example, auto makers could develop better odometers; the National Highway Safety Bureau could require them; the FTC could compare notes with Senator Byrd; states could pass uniform title laws; and above all, Congress could pass meaningful antitampering legislation.

Meanwhile, there is something to be learned from Assistant Attorney General Meade's historic venture: Even weak laws *can* be enforced. His Great Odometer Raid certainly hasn't stamped out odometer tampering, but it has made the practice a good deal riskier in Massachusetts.

WASHINGTON, D.C. December 10, 1970,

MR. DOUGLAS TOM,
Director, National Highway Safety Bureau,
Department of Transportation,
Washington, D.C.

DEAR MR. TOMS: I am writing in reference to our conversation the other day about consumer information regulations. Contrary to your understanding, it appears that the NHTSB has taken steps to discontinue rulemaking on a number of these regulations.

Of the nine consumer information regulations initiated in the *Federal Register* on October 5, 1968, in the form of Advance Notices of Proposed Rulemaking, three have been issued as regulations applicable to passenger cars, and two are in the process of being extended to other types of vehicles. These regulations are:

- Braking performance.
- Tire reserve load.
- Acceleration and passing ability.

Two other regulations appear, based on the information in the Bureau's New "Program Plan for Motor Vehicle Safety Standards" to be on their way to final issuance. These are:

- Performance of passenger cars and MVPs when towing trailers.
- Field of view for drivers (first published as an NPRM two years ago on December 11, 1968).

However, it is our understanding that since publication of the "Program Plan", a decision has been made to discontinue the Field of View regulation and issue it as a motor vehicle safety standard, primarily because it might be too complicated for some consumers to understand. This argument should be rejected on the basis that the issuances of the Bureau should not be made to conform to the least capable interested party—either consumer or manufacturer.

The "Program Plan" lists three consumer information regulations as "Terminated". These include two of the original nine plus one new proposal. Those listed as terminated are:

Lateral intrusion protection of passenger compartments in a crash (first published as an NPRM on December 11, 1968).

Flammability of materials in vehicle interiors (first published as an NPRM on December 11, 1968).

Roof intrusion.

The two remaining proposals from the original nine have a apparently dropped out of sight. They are not mentioned in the program plan as being active or terminated. These are:

Illumination and glare Produced by headlamps.

Steering ratio (first published as an NPRM on December 11, 1968).

The Bureau's activity to date in the development, publication and termination of consumer information regulations raises several issues. First, a statement of policy is needed on the Bureau's future intentions including:

(1) An explanation of the reasons why proposed consumer information regulations have been terminated.

(2) Why there was no press release or explanation to the public?

(3) What new information regulations are expected to become effective on January 1, 1971 and January 1, 1972?

(4) Whether regulations relating to vehicle injury causation are now contemplated?

(5) The Bureau's view of the value of this program.

My concern over the administration of this part of the NHTSB's program which was added to the legislation by Representative John Moss, is not unfounded. It is fair to say that it has not received priority in funding, staff allocation or organizational level even though it potentially can play a key role in upgrading the safety of motor vehicles without the administrative expense or limitations of minimum vehicle safety standards. But, not until the true safety value of a vehicle is revealed and made widely known can it be expected that the public will buy a vehicle primarily on the basis of its safety qualifications. Your regulations will not serve this purpose until they are actively publicized in all forms of media, especially television. The publication of several thousand booklets about one or two aspects of vehicle safety performance has virtually no impact on the purchasing public.

With regulations covering critical aspects of vehicle safety performance and imaginative publicity this program could produce safety upgrading by the motor vehicle manufacturers through selective consumer feedback. As a matter of information I would appreciate an explanation of the Bureau's compliance activities to enforce these regulations. For example, have any violations been found to date? What percentage of the marketplace has the Bureau tested for conformance?

Perhaps one remedy might be the designation as a specific office and staff in the NHTSB to be responsible for development, enforcement and publicity of consumer information regulations as an integrated program rather than continued maintenance in its present status of merely another function of the already overburdened engineering staff.

Finally, I urge at the same time that the regulations be revised (as has been under consideration since your arrival at the Bureau) to require manufacturers to supply data on the actual safety performance of their new vehicles. The present regulations which permit manufacturers to supply minimum or maximum data masks and important differences between makes and models of vehicles. Unless revised regulations are proposed in the next few months, it will again be too late to make changes before the next model year tests are already structured in the old model.

I look forward to your clarifications and comments on these matters.

Sincerely,

RALPH NADER

JULY 9, 1971.

MR. DOUGLAS TOMS,

Acting Director, National Highway Traffic Safety Administration, Department of Transportation, Washington, D.C.

DEAR MR. TOMS: We have corresponded on the subject of vehicle safety consumer information regulations previously (see letters dated December 10, 1970 and February 23, 1971, and responses dated January 15, 1971 and March 10, 1971).

On March 10, 1971, Mr. Gilbert Watson stated the following in response to my letter of February 23 to you:

"The Consumer Information Series and its relevance to the various standards will become a Consumer Affairs project. I certainly understand the concept you suggest [issuance of a consumer information regulation accompanying each motor vehicle safety standard]. In large degree, I support it. But there still appears to me to be reporting areas—covered by Safety Standards—which almost defy the assignment of performance indices and ranking. I would resist any area of reporting and ranking which could result in undermining the Safety Standard because of consumer apathy or misunderstanding.

"The concept will require time to develop in terms of 20 or 30 standards and correlated reporting areas."

Could you please tell us what activities have been inaugurated in the four months since March 10 and their current status? We would also like to know which "reporting areas" defy "assignment of performance indices" and would undermine safety standards.

In contrast to Mr. Watson's letter, your testimony of June 16, 1971 before the Senate Commerce Committee suggests a different view. In that testimony you state:

"We have determined that publishing a regulation for consumer information, with an objective test procedure, is just as difficult and time consuming as issuing a safety standard. Therefore, we have concentrated our energies on developing safety standards to ensure that all purchases of new passenger cars receive a motor vehicle with a basic level of safety."

For over two years, no consumer information regulations have been issued by the NHTSA. During the same period you have been allotted a substantial increase in the size of your staff.

In view of the fact that you have not used the broad consumer information provisions in the present law, it is ironical that you should propose to the Congress in this same testimony a request for additional authority to act in this area:

"The Administration's bill would give the Secretary of Transportation the authority to do the following:

"1. To develop and disseminate as widely as possible information on the damage susceptibility and crashworthiness of all major makes and models of automobiles if the development of such information is feasible, and beneficial to the public interest.

"2. To request, and, if necessary, require automobile insurance companies to furnish the Department with accident claim data relating to personal injury and property damage and the cost of remedying the damage. The data would be used in determining the feasibility of the program and to develop such consumer information.

"3. To require automobile insurance companies to furnish the Department with a description of the extent their insurance rates or premiums for automobiles are affected by the damage susceptibility and crashworthiness of individual makes and models of automobiles.

"4. To require automobile manufacturers to furnish the Department with information relating to their efforts to improve the crashworthiness and reduce the damage susceptibility of their automobiles. The Secretary would have authority to make this information available to the public with appropriate safeguards.

"5. To conduct a research and testing program, including the crash testing of automobiles, to aid in determining the feasibility of developing the consumer information and in developing such information."

Since your proposed bill would not require you to report on even the feasibility of issuing vehicle crashworthiness consumer information regulations until July 1, 1973,¹ two years from now, it appears doubtful that this so-called new authority will result in the issuance of regulations for at least three or four years and of course they will not be effective for another year or more after issuance—1976 or so.

Under these circumstances, could you please tell me exactly when you intend to issue consumer information regulations under Section 112(d) of the National Traffic and Motor Vehicle Safety Act of 1966. Important and long-pending

¹ Such feasibility has already been endorsed and described by NHTSA in 1969 testimony before the Senate Commerce Committee.

candidates include vehicle interior flammability, side impact protection, roof intrusion, and field of view. None of these important items are outside the range of current standards or rulemaking. Could you also explain why these types of regulations cannot be issued with little additional effort whenever the equivalent standard is proposed and issued. Not only is there no evidence to support your comment that information standards are as time consuming to prepare as safety standards, but wholly ignored is the ease of issuing the former when the latter have been issued or when the latter have been proposed.

The reasons for your legislative requests numbered one, four and five are not clear. An explanation from your legal counsel as to whether or not you already have legal authority under Public Law 89-563 to conduct the programs they describe to the extent they concern automobile safety would be desirable to clarify some important ambiguities in your statements.

With regard to item 5, it would be important to have a clear explanation of why you discontinued the vehicle-to-vehicle and other crash testing programs, discussed in testimony before the Senate Commerce Committee in April 1969 and which Mr. Frank Turner subsequently and explicitly promised Senator Hartke would be resumed in December 1969. Again why do you now request legislation to resume a program you discontinued 18 months ago? If this new program you are proposing is different from the prior one, surely the Congress and the American public have a right to know that fact, and the nature of the differences.

On page 7 of your testimony you state:

"We have recently established an Office of Consumer and Public Affairs which will devote itself exclusively to the better means of informing the public on the vehicle and equipment which they use. We have a wealth of research and engineering information within the organization. Much of this can be translated into consumer information to provide very valuable guides to the consumer on safe operation and maintenance of his vehicle."

These statements are vague. Could you please provide an explanation of the "better means" you have in mind and the "research-engineering information" to which you refer? Do the former include use of television, for example. I noted last month the coverage given to the press release from the Federal Trade Commission on the effective date of the child seating standard. It was barely visible on the least significant page of the few newspapers which printed it.

If your suggested bill were enacted in the form in which it is proposed, what resources do you estimate are needed for fiscal years 1972, 1973, 1974 and 1975 in order to carry it out with maximum impact? It is hardly possible to comprehend its size and priority in the NHTSA without such information, which is noticeably absent from the bill.

I look forward to a factual response to this inquiry. Whatever additional comments you may wish to volunteer about this deplorable weakening of resolve would be useful to have for indications of future trends.

Sincerely,

RALPH NADER

FEBRUARY 23, 1971

Mr. DOUGLAS TOMS,
Acting Director, National Highway Traffic Safety Administrations, Department
of Transportation, Washington, D.C.

DEAR MR. TOMS: I am writing to confirm the substance of our meeting with you on February 8th. Our discussions were so wide-ranging that a written record of our agreements and unanswered questions is preferred.

DEFECTS

A. TESTING

We do not believe the National Highway Traffic Safety Administration (NHTSA) can make objective evaluations in defect investigations without conducting or contracting for its own vehicle tests with non-industry experts. This applies particularly to Corvair instability, Corvair carbon monoxide, and the Ford lower control arm.

1. Corvair instability

The only NHTSA testing of Corvair stability was conducted at the University of Michigan as part of its contract to test a machine to be used in development of Department of Transportation vehicle handling standards. However, the contract monitors in NHTSA have emphasized that this series was not designed to

test the Corvair but rather to develop handling standards. According to the University of Michigan and others, because of a claimed shortage of contract funds, accelerometers were not employed on the two most severe tests of stability—rapid lane changing and drastic steer brake maneuver—conducted during this contract. As a result of this omission, the Department now lacks the information to quantitatively distinguish the relative degrees of instability of the tested vehicles. Thus, although the tests show that the Corvair (and only the Corvair) would have turned over but for the outriggers in all the J-turn tests at both 48 and 35 mph, meaningful measurement of this was made impossible.

Moreover, except for this contract, the Bureau has confined its examination of test data to that provided by General Motors. An independent analysis of vehicle instability can hardly be made without any independent testing. In view of disclosures of GM's Proving Ground reports showing Corvair instability and the critically important nature of this investigation, I urge that you immediately initiate independent, dynamic, fully-instrumented stability tests of the 1960-63 Corvair to assure objectivity rather than accommodation toward the wealth of General Motors misinformation. As we mentioned to you, a 1961 Corvair has been donated by the owner in Detroit and would be available for you to test.

2. Corvair carbon monoxide

While the tests being conducted by the Automobile Association of Southern California of carbon monoxide level in individually-owned cars is a necessary type of test, we see two defects in this particular test program. First, it is being conducted by a group which consistently has opposed vehicle safety improvements and is thus historically biased against the very program it is now employed to analyze. This policy position stems naturally from the Automobile Association's close relationship with the motor vehicle industry. Second, of all sections of the United States, southern California is an area where the degradation of manifold joints and other parts is least likely to occur. Now that the tests are in progress, this bias should at a minimum be factored into any conclusions drawn from the data.

In view of the fact that winter is more than half over, many months of DOT investigation have elapsed already, and owners of these vehicles have been exposed to this danger without effective warning from the Department, I hope you will, with the Secretary, set a firm deadline by which the American public can expect your final report on this defect.

3. Ford lower control arm

The NHTSA investigation of this problem has consisted of many wasted man-hours looking at vehicles on the road without taking them apart (with a few exceptions) to test the lower control arms. The nature of this problem is such that a visual inspection has value only if the arm is about to break and the crack is visible. This condition will rarely be found in vehicles at the moment in time when it is viewed, even though the arm may in fact have a dangerous defect. Surely the cost of a thorough test program is not outside the limits of your budget. Yet no explanation is given of why one is not made. If the Safety Administration is so confident about the objectivity and efficacy of Ford Motor Company tests, does it follow that the Administration sees no need for an independent NHTSA compliance testing facility? I would appreciate your personal explanation of the Safety Administration's policy on this matter.

B. STATUS OF PENDING INVESTIGATIONS

We raised with you the length of time since the initiation of several defect investigations and requested a status report. These include:

1. Polyester/glass fiber belted bias tires

Since our conversation about the delay in release of the results of NHTSA's investigation of these tires, I received just today your letter and the copies of the contractor reports on the road tests. We would like to study this work before commenting further.

Since no NHTSA press release was issued with the contractor reports, are we to assume that the reports have been fully accepted by the NHTSA and that they represent the Department's views of the safety of these tires?

2. Ford ignition switch

This problem was first brought to NHTSB attention by a former Ford employee, Mr. John Roach, in March 1970. After he contacted us last November, my staff discussed it further with your engineers and urged them to advise the informa-

candidates include vehicle interior flammability, side impact protection, roof intrusion, and field of view. None of these important items are outside the range of current standards or rulemaking. Could you also explain why these types of regulations cannot be issued with little additional effort whenever the equivalent standard is proposed and issued. Not only is there no evidence to support your comment that information standards are as time consuming to prepare as safety standards, but wholly ignored is the ease of issuing the former when the latter have been issued or when the latter have been proposed.

The reasons for your legislative requests numbered one, four and five are not clear. An explanation from your legal counsel as to whether or not you already have legal authority under Public Law 89-563 to conduct the programs they describe to the extent they concern automobile safety would be desirable to clarify some important ambiguities in your statements.

With regard to item 5, it would be important to have a clear explanation of why you discontinued the vehicle-to-vehicle and other crash testing programs, discussed in testimony before the Senate Commerce Committee in April 1969 and which Mr. Frank Turner subsequently and explicitly promised Senator Hartke would be resumed in December 1969. Again why do you now request legislation to resume a program you discontinued 18 months ago? If this new program you are proposing is different from the prior one, surely the Congress and the American public have a right to know that fact, and the nature of the differences.

On page 7 of your testimony you state:

"We have recently established an Office of Consumer and Public Affairs which will devote itself exclusively to the better means of informing the public on the vehicle and equipment which they use. We have a wealth of research and engineering information within the organization. Much of this can be translated into consumer information to provide very valuable guides to the consumer on safe operation and maintenance of his vehicle."

These statements are vague. Could you please provide an explanation of the "better means" you have in mind and the "research-engineering information" to which you refer? Do the former include use of television, for example. I noted last month the coverage given to the press release from the Federal Trade Commission on the effective date of the child seating standard. It was barely visible on the least significant page of the few newspapers which printed it.

If your suggested bill were enacted in the form in which it is proposed, what resources do you estimate are needed for fiscal years 1972, 1973, 1974 and 1975 in order to carry it out with maximum impact? It is hardly possible to comprehend its size and priority in the NHTSA without such information, which is noticeably absent from the bill.

I look forward to a factual response to this inquiry. Whatever additional comments you may wish to volunteer about this deplorable weakening of resolve would be useful to have for indications of future trends.

Sincerely,

RALPH NADER

FEBRUARY 23, 1971

Mr. DOUGLAS TOMS,
Acting Director, National Highway Traffic Safety Administrations, Department
of Transportation, Washington, D.C.

DEAR MR. TOMS: I am writing to confirm the substance of our meeting with you on February 8th. Our discussions were so wide-ranging that a written record of our agreements and unanswered questions is preferred.

DEFECTS

A. TESTING

We do not believe the National Highway Traffic Safety Administration (NHTSA) can make objective evaluations in defect investigations without conducting or contracting for its own vehicle tests with non-industry experts. This applies particularly to Corvair instability, Corvair carbon monoxide, and the Ford lower control arm.

1. Corvair instability

The only NHTSA testing of Corvair stability was conducted at the University of Michigan as part of its contract to test a machine to be used in development of Department of Transportation vehicle handling standards. However, the contract monitors in NHTSA have emphasized that this series was not designed to

test the Corvair but rather to develop handling standards. According to the University of Michigan and others, because of a claimed shortage of contract funds, accelerometers were not employed on the two most severe tests of stability—rapid lane changing and drastic steer brake maneuver—conducted during this contract. As a result of this omission, the Department now lacks the information to quantitatively distinguish the relative degrees of instability of the tested vehicles. Thus, although the tests show that the Corvair (and only the Corvair) would have turned over but for the outriggers in all the J-turn tests at both 48 and 35 mph, meaningful measurement of this was made impossible.

Moreover, except for this contract, the Bureau has confined its examination of test data to that provided by General Motors. An independent analysis of vehicle instability can hardly be made without any independent testing. In view of disclosures of GM's Proving Ground reports showing Corvair instability and the critically important nature of this investigation, I urge that you immediately initiate independent, dynamic, fully-instrumented stability tests of the 1960-68 Corvair to assure objectivity rather than accommodation toward the wealth of General Motors misinformation. As we mentioned to you, a 1961 Corvair has been donated by the owner in Detroit and would be available for you to test.

2. Corvair carbon monoxide

While the tests being conducted by the Automobile Association of Southern California of carbon monoxide level in individually-owned cars is a necessary type of test, we see two defects in this particular test program. First, it is being conducted by a group which consistently has opposed vehicle safety improvements and is thus historically biased against the very program it is now employed to analyze. This policy position stems naturally from the Automobile Association's close relationship with the motor vehicle industry. Second, of all sections of the United States, southern California is an area where the degradation of manifold joints and other parts is least likely to occur. Now that the tests are in progress, this bias should at a minimum be factored into any conclusions drawn from the data.

In view of the fact that winter is more than half over, many months of DOT investigation have elapsed already, and owners of these vehicles have been exposed to this danger without effective warning from the Department, I hope you will, with the Secretary, set a firm deadline by which the American public can expect your final report on this defect.

3. Ford lower control arm

The NHTSA investigation of this problem has consisted of many wasted man-hours looking at vehicles on the road without taking them apart (with a few exceptions) to test the lower control arms. The nature of this problem is such that a visual inspection has value only if the arm is about to break and the crack is visible. This condition will rarely be found in vehicles at the moment in time when it is viewed, even though the arm may in fact have a dangerous defect. Surely the cost of a thorough test program is not outside the limits of your budget. Yet no explanation is given of why one is not made. If the Safety Administration is so confident about the objectivity and efficacy of Ford Motor Company tests, does it follow that the Administration sees no need for an independent NHTSA compliance testing facility? I would appreciate your personal explanation of the Safety Administration's policy on this matter.

B. STATUS OF PENDING INVESTIGATIONS

We raised with you the length of time since the initiation of several defect investigations and requested a status report. These include:

1. Polyester/glass fiber belted bias tires

Since our conversation about the delay in release of the results of NHTSA's investigation of these tires, I received just today your letter and the copies of the contractor reports on the road tests. We would like to study this work before commenting further.

Since no NHTSA press release was issued with the contractor reports, are we to assume that the reports have been fully accepted by the NHTSA and that they represent the Department's views of the safety of these tires?

2. Ford ignition switch

This problem was first brought to NHTSB attention by a former Ford employee, Mr. John Roach, in March 1970. After he contacted us last November, my staff discussed it further with your engineers and urged them to act on the informa-

tion provided by Mr. Roach. It appears that although this problem affects all 1968 and 1969 Ford cars, it has low priority in NHTSA. In fact, ignition failure is a severe problem. It causes the vehicle ignition to cut off at any time during vehicle use, without warning. When this occurs, the vehicle cannot be started again. It has been almost a year since this was brought to your attention and I think that, even acknowledging your staffing shortages, that is ample time to make a finding on the issue.

3. *Wheel investigation*

We have heard rumblings, and have seen in letters from the Safety Administration, statements that you have been conducting for a year or more an investigation of wheel defects. Has nothing been found of interest to the public? Is there any date for completion? At least several owners with serious wheel problems brought to the NHTSA's attention have been soothed with the response that there is "an investigation in progress." This is hardly useful information for those owners or others with similar wheels who are driving in ignorant danger.

4. *Defect reporting regulations*

The defect reporting regulations issued last week contain a significant defect. They require prospective reporting, including an accounting of the number of recalled vehicles which have been inspected by or for the manufacturer, and information about any accidents and injuries related to the defect, beginning only after issuance of the regulations. This means that from late 1967 until sometime after the date of issuance, the NHTSA will not have this information for analysis of the effectiveness of Section 113 of the National Traffic and Motor Vehicle Safety Act. Would there be any objection to requesting the manufacturers to supply this information retroactively? Senator Walter Mondale was successful in making a similar request in 1967 for the first year of the program. Surely NHTSA could accomplish as much for the three years since.

C. DISCOVERY OF DEFECTS

The ability and likelihood of Department of Transportation discovery of vehicle safety defects is directly proportional to the scope and depth of its information. The present practices and capability of the Defects Office for such discovery can only be rated negligible, a deficiency not likely to be corrected by a future Compliance Test Facility's ability to test a limited number of vehicles for defects.

However, under its statutory authority, the NHTSA can require the motor vehicle manufacturers to provide current information about accidents, deaths, injuries, warranty claims, product liability suits, repair and maintenance experience, and insurance claims by make and model for independent analysis by the government. This type of information is purchased (for example, from leasing companies like Peterson, Howell and Heather in Baltimore or taxi cab companies) or sent to the manufacturers and collated and analyzed for the manufacturer's purposes. It obviously is not trade secret information. If the Department is interested in effective monitoring for safety defects and in assuring that "NHSB expertise is current, that its judgment of vehicle performance is not limited to laboratory or theory," as Secretary Volpe wrote Senator Magnuson on January 2, 1971, it should be knowledgeable of actual vehicle experience in substantial numbers. It is incredible that such information is not routinely required by NHTSA regulation. Please consider this a request for its development.

In the absence of accurate accident reporting information from the states, consumer complaint letters are one of the few independent sources of defect information now available to the Safety Administration. It is for this reason that my staff spends the many hours they do in sorting the 250 auto complaint letters I get each week and forwards the pertinent ones to NHTSA. When your office fails to copy and code the initial backlog batch of 1500 of these letters for six months or more, however, there must be a presumption that little value is assigned to the computerized analysis of complaint letters. If this is true, it is unclear what your purposes were in establishing this analysis program. I hope you will assure that the total backlog of letters can be processed within the next few weeks.

Enclosed is a copy of the FTC press release concerning complaints on autos received by the FTC which I mentioned during our meeting. It appears that this information might be a valuable addition to your consumer complaint computer listing.

MOTOR VEHICLE SAFETY STANDARDS

A. MULTIPLICITY OF ISSUANCES

We are looking forward to a more detailed statement of your plans for issuance of system-oriented safety standards with longterm regulatory effect. The present emphasis apparently is one of speed at the sacrifice of depth, with the result that the standards are little more than a confirmation of manufacturer-scheduled modifications. The only burden on the manufacturer is that he must use values in manufacturing which assure that all the vehicles from the production line do not fall below the standard. The use of multi-stage requirements, confirming the state of the art in the near term and demanding its marked improvement several years later, avoids the ever-present lead-time defense and relieves your engineers and administrators from constantly updating outmoded standards. Incidentally, when do you intend to leap the 30 mph test barricade surpassed by industry manufacturing capabilities six decades ago?

B. COMMENTS ON SPECIFIC STANDARDS

1. *Passive restraints*

The recent statements by the motor vehicle manufacturers that they will comply with the passive restraint standard (presumably to be applicable to 1974 models) with bolsters and padding is a tragic commentary on their intentions toward vehicle safety and your ability to improve it. The manufacturers could have made such improvements in their vehicles 20 or 40 years ago, to the redemption of thousands of lives and millions of crippling injuries whose cost has been paid by the victims, not the promoters. The NHTSA's great promise of the air bag saving some 6,000 lives in the first year of use becomes an illusion with the issuance of a standard which permits minimal manufacturer expenditure rather than great strides toward a new generation of safe vehicles. When will the Department mandate performance which demands more than extra padding? For 1976 models, just like Ed Cole, President of General Motors, predicted?

In view of the recent efforts of the manufacturers to degrade the public image of the air bag (see "baloney" statement by Henry Ford, jokes at special GM performance for the press on January 26, 1971, misleading statements by Mercedes engineering staff on their human cadaver research, as well as recent television advertisement), please outline your thoughts above wide public distribution via television and other media of information from the Department of Transportation and industry tests, which in fact have shown the inspiring value of these devices.

2. *Uniform tire quality grading*

In 1968, the year the statute required the issuance of standards for uniform tire quality grading, the Department of Transportation stated that the job was complicated but could be accomplished in about five years. Now, three years later, you have repeated these same assurances. This is to request that your staff prepare an official briefing on the exact status of this program, with details about the research work still required, who will perform it, its cost, and its relevance to the issuance of the standard, for the benefit of consumer representatives, the press and interested parties on Capitol Hill. Attendance by manufacturer representatives would not be objectionable.

3. *Child seating systems and restraints*

The substantive compromises and delays in the effectiveness of this standard are history. The issue now is public information about the difference between systems manufactured after the effective date of the standard, April 1, 1971, and those manufactured before but sold after the effective date. A public advisory, in the manner of your past issuances, to advise the public of this critical difference, will be useless. It will appear on a filler on page 83 of the few papers that carry it and will not appear on the air. Isn't this a perfect item for public service announcement? Isn't it appealing enough to warrant paid television spots? Can this Administration seriously justify \$500,000 for a Commerce Department export sales advertising contract and not provide information about child safety to the public? If you help create a market interest maybe even General Motors and Ford will stock their dealers with the seating systems and recommend them adequately.

1942

CONSUMER INFORMATION

Your letter of January 15, 1971, responding to my questions of December 10, 1971, about your plans on the consumer information program is incomprehensible and unresponsive. A recall and correction would be appreciated.

I look forward to hearing your response to our suggestion that a consumer information regulation accompany the issuance of each motor vehicle safety standard. The standards prescribe the minimum and the consumer information regulations disclose the performance range. Because there is no institutionalized responsibility in NHTSA for consumer information regulations, it gets no priority. The burden should be on the engineering staff to justify why a consumer information regulation is not needed with each standard, rather than on the public.

YOUTH

In my view, this program as presently designed is a waste of time, expensive (NHTSA estimate for fiscal year 1971: \$75,000), and uses precious staff positions (NHTSA estimate for fiscal year 1971: three permanent and three temporary). If your goal is to inform and motivate young people to work for reduction of the high youth and injury rate, an effective program must be developed. As I promised, you will receive a suggested prospectus for your consideration.

PUBLIC READING ROOM AND INEXPENSIVE COPYING

A public reading room is a minimum administrative requirement for every government agency. If the local law schools can afford a nickel self-operated Xerox machine, surely one can be installed for public use in NHTSA.

REPORT ON AGRICULTURAL TRACTOR SAFETY ON PUBLIC ROADS AND FARMS

I most strongly disagree with the recommendation in this report against legislation authorizing mandatory safety standards for tractors and in favor of a five-year delay to allow voluntary industry action not forthcoming in the last 25 years. I will submit shortly a separate critique of the deficiencies in the report's recommendations.

WAIVER OF ANTI-TRUST LAWS

The discussions which have been pursued in the National Motor Vehicle Safety Advisory Council suggesting waiver of the anti-trust laws to allow so-called "industry cooperation" and favoring informal meetings with NHTSA staff prior to initiation of formal rulemaking were discussed in the Congress and in the Department before you were appointed. Both suggestions were firmly rejected. If there is any temptation on your part to acquiesce to these repeated intrusions on the legal and ethical administration of the vehicle safety program, I suggest you first read the letters sent in the spring of 1966 from Mr. Ramsey Clark and Mr. Donald Turner of the Justice Department to Senator Warren Magnuson. It was on the basis of the assurances in these letters that the following language was included in the National Traffic and Motor Vehicle Safety Act of 1966:

Nothing contained herein shall be deemed to exempt from the antitrust laws of the United States any conduct that would otherwise be unlawful under such laws, or to prohibit under the antitrust laws of the United States any conduct that would be lawful under such laws.

Further, as a matter of clarification for all concerned, particularly your staff, I would appreciate your views on our suggestion for an Administrator's order defining the legal and ethical boundaries for exposure of NHTSA staff to informal commentary by interested parties during rulemaking.

HIRING OF TOP STAFF

Since the Safety Administration was formed in 1966, there has been an absence of fully qualified top staff in key positions. Today, five of your key officials and numerous others are in "acting" capacities. After 14 months in office, this is not a creditable record. It is demoralizing to the staff and destructive to productivity. If I can be of any assistance to you in making changes in this arrangement, please let me know.

EFFICACY OF HEAD RESTRAINTS

As the enclosed article from the *New York Times* shows, Mr. Lee Iacocca is stating publicly that head restraints (required by federal standard) may be virtually useless and that "government officials now agree that the head restraints may be of little safety value". Will you publicly clarify your position on this matter?

DIAGNOSTIC ANALYSIS OF VEHICLE MALFUNCTION

The recent developments by Volkswagen with built-in vehicle diagnostic equipment for analysis by dealers appears to be a promising device. Your comments on its possible application by federal safety standard to all vehicles would be appreciated.

Sincerely,

RALPH NADER

MARCH 10, 1971.

Mr. RALPH NADER,
Washington, D.C.

DEAR MR. NADER: Since the major portion of your February 23rd letter covers inquiries assigned to my office for coordination and reply, Mr. Toms has asked me to give you a point-by-point report on our progress to date.

DEFECTS

A. TESTING

NHTSA has long recognized and agrees there is urgent need for a defects-investigating capacity which is independent of the manufacturer as to facilities and personnel.

While your letter enumerates the Ford Lower Control Arm and Corvair's problems as examples, we see fundamental differences in the investigative expertise required for Compliance investigation as opposed to Defects investigation. The differences point to an urgent need for real separation of the two functions. We welcome your observation and agree with it. We are in the process of tackling the problem now. Unfortunately, if our previous experience is any indicator, it will be a while before we can implement.

1. Corvair instability

Our immediate reaction to your offer of a 1961 Corvair for testing use is "Where is it? . . . We want it." You are correct in stating the Michigan tests did not provide an index of relative stability. They were not designed to do so; neither facility nor test procedures having evolved to a stage of reliability capable of giving us conclusive answers—whether positive or negative.

Our staff estimates we are still some nine months away from completion of this exercise. That is too long a time, but I do not want to mislead you on how long it will take.

As a special project we can conduct a series of cornering and lateral acceleration tests, setting up arbitrary test criteria, and coming up with a relative performance for the test vehicles. This we will do.

2. Corvair carbon monoxide

As noted previously, firm deadlines for completion of the California test program have been set. We note your criticism of the contractor and the test region. We do not believe there is reason to prejudge the test conclusions but agree that if there is weight to your criticism it must bear on those conclusions.

As a effective warning from the DOT, we acknowledge that the media coverage of our Consumer Protection Bulletins fall short of perfection. We are exploring means to make use of TV public service spots—perhaps paid spots—where public safety is an urgent, immediate objective. My office will work toward this and other coverage methods which show promise of reaching a larger public.

3. Ford lower control arm

The difficulty of dismantling Lower Control Arms is such that it nearly exceeds our resources. Admittedly, such testing might conceivably disclose and prove a frequency level our investigations have failed to prove. But if it did not—and investigation points to this negative—NHTSA would have made a heavy expenditure of public funds to confirm its own findings.

We have *not* closed this investigation. We have received a continual flow of information and have acted upon it to verify the particulars of every alleged failure. Within the next thirty days we expect to make a public report on this material.

As to the need for an independent compliance test facility, we certainly *do* need this, urgently. We have included this need once again in our legislative and budgetary requests. We welcome your support in the effort to acquire it.

B. STATUS OF IMPENDING INVESTIGATIONS

1. *Polyester tires*

As noted, you have both our letter and the contractor's report on this matter. You question the reasons for withholding a press release at the time of our report to you. First, in view of the report's conclusions and the broader questions you have raised, a press release may be both premature and misleading. Second, there is little justification for announcing the investigation closed. We are not ready to reassure the manufacturer nor to realarm the user.

2. *Ford ignition switch*

This matter needs investigation. My office hold this assignment. A complete report will be submitted as promptly as possible.

3. *Wheel investigation*

The same need exists as above. I will submit a detailed report when our inquiry is complete.

4. *Defect report regulations*

This matter is no longer in question, excepting your suggestion that NHTSA apply the current regulations retroactively.

We fully intend to make such a request. Manufacturers can respond with a refusal—a response we do not expect from them. More probably they will object on the ground that they do not have the information in the detail and form required. We doubt that NHTSA has any alternative to acceptance of whatever information is furnished for the 1967-71 period. But we intend to make the request and to use the information supplied.

C. DISCOVERY OF DEFECTS

Your questions raise two matters closely related: our failure to utilize many ripe sources of information which could significantly define the areas needing investigation, and our on-going capacity to utilize this information if we called for it.

Our project to computerize the flow of consumer correspondence supplied by your office demonstrates the problem. Manpower to transcribe information from consumer letters to data sheets—an expert will handle some fifty letters per day—can be figured for your 3,000 letter backlog as 60 man-days or a four-week task for three experts, fulltime. We are processing our own flow of consumer correspondence and the current flow from Lowell Dodge's office. We do not have three experts left over. In this case we expect to complete an RFP for submission to an outside contractor to get this job done.

We hope to remedy the problem; looking to our growing computer facility, to outside expertise and to budgetary relief to bring the cure. For the present, we have none of these available to process the information we might ask for.

MOTOR VEHICLE SAFETY STANDARDS

A. MULTIPLICITY OF ISSUANCES

1. *Passive restraints*

Your comments on this item define some areas in which we differ. We regard bolsters and padding as Passive devices. If their use brings compliance with the Standard and the established test criteria, we cannot look on the improvement as tragic, even though it *is* tragic that the same improvements could have been effected many years ago.

It is up to the manufacturer to decide the point at which he will not be able to meet the test criteria with "extra padding" or achieve a certification under this Standard. It is up to us to enforce the Standard's progressively demanding requirements.

2. Uniform tire quality grading

Research and hard data for this Standard have progressed to the point of preparing an NPRM covering four out of six grading criteria eventually intended for consumer grading. The six are Highspeed Performance, Static Strength, Endurance, Force Variation, Traction and Treadwear. The last two named are characteristics which tend to relate inversely in any single tire. The exact nature of this inverse relationship is still in the research phase and will not be covered in the "first generation" UQGS Standard. It will be phased into the Standard when research is completed.

Target date for the NPRM is May 1, 1971. Following issuance of the NPRM a public briefing will be held.

3. Child seating systems and restraints

We are informed that some ten manufacturers definitely plan to meet the effective April 1 dating of this Standard with products certified under the Standard. We hope this means an adequate shelf-supply of Child Seating devices for the public in the very near future.

As to public advisories explaining the inadequacies of pre-Standard products, we couldn't be in more complete agreement. The situation calls for Public Service TV time, and, if possible, for paid spots in prime time. Hopefully, we will lay the groundwork at the same time for regular use of TV coverage to get our Consumer Bulletins and Public Advisories maximum visibility.

CONSUMER INFORMATION

Since I "perpetrated" the January 15th letter in an attempt to expedite a response, you have my apology if it seemed unresponsive, etc. It seemed to represent a "pattern of fire" to me and I responded with a discussion rather than a detailed list of answers. If there are specifics which have not been exhaustively discussed since, I will answer those questions in the next few days.

The Consumer Information Series and its relevance to the various Standards will become a Consumer Affairs project. I certainly understand the concept you suggest. In large degree, I support it. But there still appear to me to be reporting areas—covered by Safety Standards—which almost defy the assignment of performance indices and ranking. I would resist any area of reporting and ranging which could result in undermining the Safety Standard because of consumer apathy or misunderstanding.

The concept will require time to develop in terms of 20 or 30 Standards and correlated reporting areas. Discussion with you or your staff on this project could be of benefit to me. I would welcome it.

YOUTHS

This project has undergone revision within the last week, being removed from the status of a Task Force under Mr. Roche and placed under the line administration of Dan Fulmer's office. Mr. Roche will continue to be a principal in the Youths effort, but primarily in its administrative demands as opposed to direct interface with the Youths Committee and their future activities in highway safety. Mr. Fulmer is aware that you have offered to submit a prospectus for our consideration. It would be most welcome.

PUBLIC READING ROOM AND INEXPENSIVE COPYING

We are still in hope of supplying these facilities. We agree without question they are needed. The problem is double: a definition of any policy which may limit or prevent us from setting this up, a decision to make a special policy for our special need. We are following this.

REPORT ON AGRICULTURAL TRACTOR SAFETY

We will await your critique and give it careful study.

WAIVER OF ANTI-TRUST LAWS

We are in agreement in regard to any general waiver of anti-trust provisions. Where special and specific situations arise in which the cause of highway safety and the motorist's benefit may depend on a waiver we would favor examination on a case-by-case basis to determine if waiver might be justified.

1946

In regard to a suggested Administrator's order to define the conditions in which NHTSA may comment informally on actions during rule making, there exists already a detailed Executive Order, which I am enclosing with this letter. This Order # DOT 2100.2 is specific and spells out the limitations during rule making.

HIRING OF TOP STAFF

You describe a situation which the Acting Administrator recognizes and deprecates. We continue to hope that prompt improvement can be effected. Your offer is appreciated.

EFFICACY OF HEAD RESTRAINTS

Your request for clarification of the Acting Administrator's position seems unnecessary. We don't know what "government officials" Mr. Iacocca is supposed to have quoted, nor whether the *Times*' article accurately quoted Mr. Iacocca.

DIAGNOSTIC ANALYSIS OF VEHICLE MALFUNCTION

We are closely watching the Volkswagen development and agree that it could represent a significant forward step if successful and accepted. It is too soon to predict any rulemaking action related to diagnostics in this area, but the Administration will continue to follow the Volkswagen project with a great deal of interest.

Sincerely yours,

GILBERT L. WATSON,
Consumer Affairs Officer.

U.S. DEPARTMENT OF TRANSPORTATION
NATIONAL HIGHWAY TRAFFIC SAFETY ADMINISTRATION
Washington, D.C., January 15, 1971.

Mr. RALPH NADER,
Washington, D.C.

DEAR MR. NADER: Thank you for your letter of December 10, 1970. It raises a number of specific questions but in its entirety seems to ask for a discussion of policy.

If I may paraphrase what comes through to me as your concern in this instance it is, "What policy guides our determination in choosing the Motor Vehicle Standards-approach (to safer auto performance) as opposed to the Consumer Service and Information-approach?"—and this could easily be put in reverse order.

Rather than go to the specifics of your letter, which are really answered by the policy determination anyway, I think your concern is timely and I welcome the chance to discuss the broader question.

First, your letter comes at a time when both "approaches" are under intensive study. The question of proliferation of Vehicle Safety Standards poses real concerns for us as for the auto industry. Continual revision and reassessment must not be just a catch-phrase and we are deeply involved in this process. We aim, wherever possible, at consolidation of standards and towards a performance oriented family of standards in which total vehicle and component performance guarantees a higher and higher level of motor vehicle safety.

The other "approach", that of direct consumer information and service, is one we are working to develop more fully. We have given a great deal of study to the possibility of a National Highway Traffic Safety Administration Consumer Affairs Office and to placing within its responsibility many of the functions your letter suggests. The idea is very much alive, still. No matter what entity evolves from this effort, what is important is that a greatly improved and comprehensive approach to direct consumer services will be the result.

As to policy determination—a balanced drive for safe vehicle performance, in which both "approaches" are used to maximum effectiveness—I believe you have made the point in prior correspondence that we must never let Consumer Bulletins, for instance, become a relief valve for industry's responsibility to comply with the motor vehicle standards. In the same way, of course, we must not attempt in a proliferation of standards to handle those consumer needs which are better handled in direct and timely consumer information.

The specific questions of your letter really go to this question of which "approach" is chosen. For us the matter must be a case-by-case, or regulation-by-regulation determination.

Very briefly, for instance, the Field of View matter evolved into a determination of (1) what could be accomplished in vehicle safety payoff; (2) what reliable, measurable feedback from consumer buying could be accomplished as a result of a consumer approach; and (3) which approach could be counted upon to bring design and structural improvement to a significant portion of the vehicle population, in the shortest time. It is a bad over-simplification to name "complication" as the basis of our determination, and this was not the case.

It was our judgment that the regulation was very difficult to present in criteria measurements which were understandable. But more important, resulting feedback could not bring the same clear mandate for more adequate field of view which we could legislate through the standards process. Whenever the correlation between greater safety and consumer preference is not abundantly clear to the consumer, I believe we must be sensitive to the possibility that market feedback from the buying public *can be* a measurable negative instead of the positive impulse we are trying to create.

Put another way, whenever reliable feedback depends on our successful conduct of a considerable public education program we must also consider the surer "approach" of a motor vehicle standard to upgrade the level of safety as rapidly as possible.

We have no intention of letting the Consumer Information Series decrease in its scope or in its expanding function toward a general performance ranking of automobiles coming onto the market. For the present it appears that additions of other performance "areas" and the ranking of each in turn, is more feasible than a total vehicle performance index—and better serves the various tastes and needs of the total public.

Finally, with regard to the issue of actual versus minimum or maximum data, our current plan is to continue the regulations on the present basis. Some types of regulations are amenable to the furnishing of information within specified tolerances, and where it is feasible we intend to use such methods to make the information as realistic as possible. In others, such as braking and acceleration performance, the requirement for "actual" information would present great difficulties, particularly with respect to defining in general terms which of a manufacturer's vehicles must be tested, how they are to be equipped, how many vehicles of a given type should be tested, and precisely which results should be reported (best, worst, average, etc.). The cost of such test programs, which would be passed on to consumers, is another consideration taken into account.

Your suggestions are to the point and of significant value to us. While we are in the throes of reassessment and upgarding part of our effort toward more direct consumer services, I especially appreciate and share your concern for policy determinations which can bring the best results from both "approaches" to maximum vehicle safety performance.

Thank you, again, for your letter.

Sincerely,

DOUGLAS W. TOMS,

Acting Administrator, National Highway Traffic Safety Administration.

LYNN M. F. HARRISS, FASLA,
Washington, D.C., March 12, 1971.

HON. PHILIP A. HART,
The U.S. Senate, Washington, D.C.

DEAR SENATOR HART: The news account of the testimony of Dr. William Had-
don before your Senate Commerce Committee was most interesting to me. For
some time I have viewed with concern—and recently with alarm—the trend to-
ward emasculating bumpers to the present sad state of little more than orna-
mentation. The almost incredible thing is that while bumpers have become less
and less, modern traffic has been needing them more and more.

I sincerely hope that you and your committee will see fit to report favorably
on the bill to require manufacturers to equip *all* cars with heavy and service-
able bumpers, and even to require a uniform height above the pavement so that
on impact they will meet and protect rather than overlapping and hooking
into one another.

Some years ago, there were proposals for building bumpers all the way around
the car, not just on the front and rear. This may be too much to hope for now,
but the bill now before you certainly seems a much-needed step.

Very sincerely yours,

LYNN M. F. HARRISS.

NATIONAL ASSOCIATION OF INSURANCE AGENTS, INC.,
Washington, D.C., March 19, 1971.

HON. WARREN G. MAGNUSON,
Chairman, Senate Committee on Commerce,
New Senate Office Building, Washington, D.C.

DEAR MR. CHAIRMAN: On behalf of the members of the National Association
of Insurance Agents, representing some 33,500 independent agencies with ap-
proximately 150,000 individually licensed insurance producers located through-
out the nation, I am writing to you to express our deep interest in and concern
for the public interest, as well as our own, in connection with automobile acci-
dent reparations.

We believe some remedial action is warranted to correct the now recognizable
imperfections, that, under the unique conditions of the past several years, have
developed in our present system. We remain firmly convinced, however, that
basically the fault concept best serves the public, although it now does appear
to have some shortcomings.

Our deep concern for improvements in the present automobile accident repara-
tions system has taken the form of a careful study by the Casualty Committee
of this national association. This committee's recommendations were unanimous-
adopted in January by our National Board of State Directors. This action is
most significant in that it provides an accurate public reading of the feelings
and attitudes presently existent among agent leaders and memberships in each
of our 50 state associations.

The recently modified position of the National Association of Insurance
Agents, which we now find closely parallels the position taken by some other
major insurance organizations, is as follows:

1. That the National Association of Insurance Agents supports a system which
provides for immediate first-party payments for economic loss due to bodily in-
juries caused by or resulting from automobile accidents.

2. That the National Association of Insurance Agents reaffirms its position
that the tort liability principle should be retained.

3. That the National Association of Insurance Agents maintains the firm con-
viction that every effort should be made to correct the deficiencies of the present
system, on a state-by-state basis, before the basic principles of the system are
subjected to a major modification.

4. That the National Association of Insurance Agents recognizes the public
need to develop some objective standards for measuring general damages.

From these four basic points you will recognize that the many thousands of
independent insurance agents comprising our association's membership, while
they do recognize some imperfections in the present fault concept under which
our society has operated for decades, firmly believe that such conditions do not
call for a complete scrapping of the whole fault concept. Individual wrong-
doers should continue to be held basically responsible for their negligence, even

1950

though some form of basic first-party reparations now may be in the public interest.

It is recognized that these four basic recommendations are broad in scope, but they are purposely so in order to leave the ultimate and proper decisions of specific actions to individual states where variations and conditions dictate varying solutions. We agree wholeheartedly with the statement of Secretary of Transportation, John A. Volpe, in his testimony before your committee on March 18, 1971, when he said, "We need not and do not insist that a single reform system be imposed upon all the states. The experience of the states should have much to tell us about the most desirable final configuration of the motor vehicle operation system."

We also concur with Secretary Volpe's statement that "as various first-party no-fault plans are implemented in various states, answers will be forth coming to the question of whether some variants of the program we suggest work better than the present system or not. In this manner, states may be able to spare themselves most of the uncertainty, and greatly reduce the financial risk, that would be involved in any single step, 'all the way', perhaps irreversible change of the system."

This expression of our feeling is submitted to you, Senator Magnuson, with the earnest hope that it will assist in reaching a final decision so momentous to the public, the individual states, and the several industries involved.

Respectfully,

HOWARD H. LEIGHTON,
President.

WASHINGTON STATE COUNCIL OF CHURCHES,
Seattle, Wash., April 22, 1971.

HON. WARREN G. MAGNUSON,
*Chairman, Senate Commerce Committee,
Senate Office Building,
Washington, D.C.*

DEAR SENATOR MAGNUSON: We understand that there will be hearings from May 3 to May 7 and from May 10 to May 14 on Senate Bills 945, 946 and 976 and a concurrent resolution regarding the present auto insurance system and proposals for effective changes.

It is difficult for us in the Northwest to afford the trip to Washington, D.C., but we wanted you to know our particular position.

We most heartily encourage you to examine such possible legislation and then push for it. We find that poor people in our State are unable to pay for insurance and that many people are risking imprisonment by driving without valid insurance or licenses because of the great cost to them.

Because of these conditions there are many people, therefore, who have automobile accidents with these uninsured motorists who have no way of being compensated for any loss that might be theirs. We are equally interested in the diagnostic inspection for the safe repair of vehicles involved in auto accidents. Once again your committee has exhibited a great interest in the protection of the consumer and for this we give you our thanks.

If there is anything we can do from here to be of further assistance, do not hesitate to have your staff let us know.

Sincerely,

EVERETT J. JENSEN,
General Secretary.

SOUTHERN SERVICE COMPANY,
Arabi, La., April 26, 1971.

Senator PHIL HART,
*Old Senate Office Building,
Washington, D.C.*

DEAR SENATOR HART: It was with great interest that I read an article in the New Orleans States Item, a few days ago, regarding the findings of your anti-trust subcommittee based on studies of car inspection and repair figures. The comments of what your investigations had turned up in regard to the condition of new cars on delivery to the consumer is very interesting, and I thought you might be interested in what is happening here in New Orleans in regard to this very same situation.

For many months the management of Southern Service Company, which is an automotive import terminal, has recognized the fact that the automotive manufacturers, both domestic and import, have relied far too heavily on their dealer organization to act as the final inspector for quality control of their products before being delivered to the consumer; and because of this have created the customer dissatisfaction that has become evident across the nation today.

Southern Service Company has developed and is presently installing for one of their import accounts, (Mid-Southern Toyota Distributors) which covers a fourteen state area in the Mid-West, a complete new concept which could be adopted by any manufacturer, either domestic or foreign; and which would virtually eliminate the consumerism attitude of today.

Under this concept, Southern Service Company has set up for the Toyota account two complete production type diagnostic lanes by which every Toyota product being brought into the Mid-West through the Southern Service port facility will undergo a complete quality control inspection encompassing over seventy-five various mechanical and visual inspections, enabling the dealer to deliver a totally quality controlled vehicle to the consumer. These diagnostic lanes are complete to the extent of checking both Hydrocarbon and Carbon Monoxide content from each vehicle to ascertain the meeting of all present ecology requirements and making a full load dynamometer check for total engine performance. We are offering this service to other import manufacturers and are presently negotiating to set up services of this type in other areas and felt that our contribution to this cause might be of interest to you.

I would like to extend to you and your committee an invitation to visit our facility here in New Orleans which is located in the suburb of Arabi directly on the Mississippi River, in the old Ford Motor Company Assembly Plant. We have at this location a complete auto import terminal facility and we feel that it would be very interesting for you to stop by and look us over at your convenience, to see first hand what can be done to benefit the consumer and ecology.

Sincerely,

SHERMAN T. SMITH,
Plant Production.

STATE OF NEW YORK,
STATE CONSUMER PROTECTION BOARD,
New York, N.Y., April 27, 1971.

Senator PHILIP HART,
*U.S. Senate,
Washington, D.C.*

I strongly support the No-Fault Auto Insurance Bill which you and Senator Magnuson jointly sponsor and on which you are presently holding hearings. Too many of us know through painful experience that the present system is unfair. It costs too much, compensates too few, encourages dishonesty and rewards its subscribers with unwarranted policy cancellations. The No-Fault Auto Insurance system, on the other hand, would compensate all auto accident victims, except deliberate lawbreakers, while costing us less and paying us sooner. A recent Gallup Poll showed that a majority of American consumers who understand the concept of No-Fault Auto Insurance support it. I think it is up to those of us who do understand to make our voices heard. I urge you to spare no effort in passing this badly needed legislation.

BETTY FURNESS.

STATE OF NEW YORK,
STATE CONSUMER PROTECTION BOARD,
New York, N.Y., April 27, 1971.

Senator WARREN MAGNUSON,
*U.S. Senate,
Washington, D.C.*

As hearings begin on your proposed No-Fault Automobile Insurance Bill, I want to add my voice to the many others who will be speaking out in favor of it. Our present system denies compensation to one-quarter of all persons injured in automobile accidents. Our present system allows insurance companies and agents, lawyers and claims investigators to take up to 56 cents on every personal injury liability insurance premium dollar. The fault system encourages dishonesty and overreaching by both claimants and insurers. The system abounds with unwarranted policy cancellations. I strongly favor the No-Fault Insurance concept. I support a system which will lower insurance premiums while compensating all

auto accident victims, except deliberate lawbreakers. I am confident all the testimony given at your hearings will clearly demonstrate that the time for No-Fault Auto Insurance is long overdue.

BETTY FURNESS.

MCDONALD, McDONALD & McDONALD,
Dalton, Ga., May 5, 1971.

Hon. DAVID GAMBRELL,
U.S. Senate,
Washington, D.C.

MY DEAR SENATOR GAMBRELL: I am enclosing herewith a page from "American Bar News, Vol. XVI, No. IV, April, 1971" containing a publication under the heading "Senate Begins Auto Insurance Hearing" and is circled on said enclosure.

I have been present at meetings of several of our local bar associations in this area of the State and find that the consensus of opinion of members thereof is strongly against "No-Fault" system discussed in the enclosed article.

I am sure that you are more familiar with this proposed legislation than I am and that you are in a much better position to express an intelligent opinion concerning same than I am. However, I did want you to know my views and apparently the prevailing view among lawyers of this section on the subject matter. I very definitely feel that this proposal would amount to a step in the wrong direction.

If Senator Baker is being correctly quoted in said publication, although I agree in principle with what he says, I cannot fully agree that "the fact that so many persons are willing to abandon the system . . . is, 'a sad sad commentary on the failure of the judicial system in America.'" Concerning this, I, rather, feel that the fact that so many may be willing to abandon the present system is not due primarily to the fallacy of the system, but is, rather, due to a lack of information concerning the present system being passed on to the public and a resulting failure of the public to understand the operations of the present system. Some means of educating the public with reference to governmental functions generally, of course, is much needed. This situation, of course, certainly applies to the functions of the judicial system. Probably the responsibility should fall upon the bench and bar of the nation. However, help from any source would certainly be beneficial.

Any suggestions that you may have that might be helpful concerning this matter will, of course, be greatly appreciated. Meanwhile, we extend our continued best wishes for your much success in all your undertakings.

Yours truly,

ERNEST McDONALD.

Enclosure.

SENATE BEGINS AUTO INSURANCE HEARINGS

Only one voice was raised in clear defense of the present tort liability system at the opening of Senate Commerce Committee hearings on S. 945, the Uniform Motor Vehicle Insurance Act of 1971.

Sen. Howard H. Baker, Jr. (R-Tenn.), said the present system "is not all that bad but its execution has been very poor." The fact that so many persons are willing to abandon the system he said, is "a sad, sad commentary on the failure of the judicial system in America." The Senator also said it is important that neither side become so inflexible and dogmatic that it loses sight of the obvious problems with both the fault and no-fault systems.

S. 945, co-sponsored by Sens. Philip A. Hart (D-Mich.) and Warren Magnuson (D-Wash.), the Commerce Committee chairman, would create a comprehensive first-party, no-fault system of compensating auto accident victims under federal standards administered by the Department of Transportation. It would provide for all medical and incidental expenses plus lost income up to a maximum of \$30,000. Further recovery under the present tort system would be limited to victims suffering "catastrophic harm" through permanent disability or disfigurement and the survivors of fatally injured wage-earners.

The first witness on the bill was Secretary of Transportation John A. Volve, testifying on behalf of the Nixon administration. He also called for a shift to a comprehensive no-fault system but said it should be adopted on a state-by-state basis, allowing for a broad basis of experience. He submitted a concurrent

resolution to that effect, but with the admonition "that Congress cannot, and will not, long ignore the need for evolving new and updated approaches to insurance and accident compensation."

The resolution also calls on Council of State Governments, using appropriate instrumentalities, to develop model no-fault legislation for submission to the states. A step in this direction already is underway by the National Conference of Commissioners on Uniform State Laws which recently named a Special Committee on a Uniform Automobile Accident Claims Act.

MILQUON, PA., May 11, 1971.

HON. PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: This refers to the hearings presently being carried out by the Senate Commerce Committee, concerning automobile safety.

It is obvious that the merits of the issues being considered by the Commerce Committee are in danger of being obscured by emotion. Reduced to its simplest terms, the basic issue is this—is the automobile industry subject to Congressional control or not? The question of automobile safety is merely the vehicle (no pun intended) for bringing the basic issue to light.

Bear in mind that General Motors (not the entire automobile industry, but just one company comprising that industry) employs more people than the population of most states; has assets which exceed the assets of most states; has a budget roughly equal to that of West Germany; has profits equal to the sales of its largest foreign competitor; in short, enjoys a position of power roughly equal to that of most sovereign countries. Their sovereignty is the issue at hand.

Bear in mind also that automobile accidents account for more fatalities per year than war—even declared war; that air pollution emanating from automobile exhausts is a major (some say "the" major) factor in pollution; that the amounts being spent on highways can only be described as enormous; and that, at least for most people, purchase of an automobile represents the largest investment they make outside of the purchase of their home. Taken together, this means that the automobile industry, directly or indirectly, has a tremendous impact on the lives of individual citizens.

I think the automobile industry is saying to Congress that, to the extent that the welfare of the individual citizen is in any way related to the automobile industry, this is a matter which is out of bounds for Congress to regulate. Consider the statement of John J. Nevin,* that—

"If an automobile buyer elects to accept a damageability risk in exchange for an appearance gain or some other benefit that is important to him, that would seem to us to be his decision to make and not a matter of public policy."

First of all, I think the statement is an outrageous one, because it assumes that it is impossible to manufacture an automobile that is both attractive, from a design point of view, and safe. Personally, I refuse to believe that the automobile industry is incapable of doing this, even though Mr. Nevin seems to be convinced of it.

Beyond that, however, Mr. Nevin makes it clear that Congress should play no role in defining the product characteristics of a motor car, even though, as alluded to earlier in this letter, that product has a major impact on all of us.

Unfortunately, I think there is considerable ground for questioning the good faith of the motor car industry. Mr. Roche's constant comments to the effect that the technology does not exist at the present time to permit compliance with the pollution levels established by law has a very hollow ring to it; the statement has been directly contradicted by a number of other scientists who appear to be familiar with the problem, and at least one foreign manufacturer is willing to invest \$2,000,000 in a design developed by an American scientist (who has stated as a matter of record that the American companies have indicated no interest whatever in the approach). In addition, others are investing substantial amounts of money in the development of nonpolluting engines, and I would doubt that they would be willing to make such large investments without significant promise of a return. Foreign car companies say simply that they will comply. Do they know something that the American automobile industry does not?

*A Ford vice president who testified before the Commerce Committee.

auto accident victims, except deliberate lawbreakers. I am confident all the testimony given at your hearings will clearly demonstrate that the time for No-Fault Auto Insurance is long overdue.

BETTY FURNESS.

McDONALD, McDONALD & McDONALD,
Dalton, Ga., May 5, 1971.

Hon. DAVID GAMBRELL,
U.S. Senate,
Washington, D.C.

The resolution also calls on Council of State Governments, using appropriate instrumentalities, to develop model no-fault legislation for submission to the states. A step in this direction already is underway by the National Conference of Commissioners on Uniform State Laws which recently named a Special Committee on a Uniform Automobile Accident Claims Act.

MiQUON, PA., May 11, 1971.

HON. PHILIP A. HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR HART: This refers to the hearings presently being carried out by the Senate Commerce Committee, concerning automobile safety.

It is obvious that the merits of the issues being considered by the Commerce Committee are in danger of being obscured by emotion. Reduced to its simplest terms, the basic issue is this—is the automobile industry subject to Congressional control or not? The question of automobile safety is merely the vehicle (no pun intended) for bringing the basic issue to light.

Bear in mind that General Motors (not the entire automobile industry, but just one company comprising that industry) employs more people than the population of most states; has assets which exceed the assets of most states; has a budget roughly equal to that of West Germany; has profits equal to the sales of its largest foreign competitor; in short, enjoys a position of power roughly equal to that of most sovereign countries. Their sovereignty is the issue at hand.

Bear in mind also that automobile accidents account for more fatalities per year than war—even declared war; that air pollution emanating from automobile exhausts is a major (some say "the" major) factor in pollution; that the amounts being spent on highways can only be described as enormous; and that, at least for most people, purchase of an automobile represents the largest investment they make outside of the purchase of their home. Taken together, this means that the automobile industry, directly or indirectly, has a tremendous impact on the lives of individual citizens.

I think the automobile industry is saying to Congress that, to the extent that the welfare of the individual citizen is in any way related to the automobile industry, this is a matter which is out of bounds for Congress to regulate. Consider the statement of John J. Nevin,* that—

"If an automobile buyer elects to accept a damageability risk in exchange for an appearance gain or some other benefit that is important to him, that would seem to us to be his decision to make and not a matter of public policy."

First of all, I think the statement is an outrageous one, because it assumes that it is impossible to manufacture an automobile that is both attractive, from a design point of view, and safe. Personally, I refuse to believe that the automobile industry is incapable of doing this, even though Mr. Nevin seems to be convinced of it.

Beyond that, however, Mr. Nevin makes it clear that Congress should play no role in defining the product characteristics of a motor car, even though, as alluded to earlier in this letter, that product has a major impact on all of us.

Unfortunately, I think there is considerable ground for questioning the good faith of the motor car industry. Mr. Roche's constant comments to the effect that the technology does not exist at the present time to permit compliance with the pollution levels established by law has a very hollow ring to it; the statement has been directly contradicted by a number of other scientists who appear to be familiar with the problem, and at least one foreign manufacturer is willing to invest \$2,000,000 in a design developed by an American scientist (who has stated as a matter of record that the American companies have indicated no interest whatever in the approach). In addition, others are investing substantial amounts of money in the development of nonpolluting engines, and I would doubt that they would be willing to make such large investments without significant promise of a return. Foreign car companies say simply that they will comply. Do they know something that the American automobile industry does not?

*A Ford vice president who testified before the Commerce Committee.

GM's outrageous behavior, in its investigation, and their denial of any investigation, of Mr. Nader unfortunately seems to be more typical than atypical of their overall attitude.

Perhaps the best thing to do is simply to split the motor car companies up into a number of companies; after all, the great progress in the industry was made between World War I and World War II, not in recent years. That, however, is a longer term question.

The immediate question which is being debated is whether or not it is proper for Congress to regulate the design of an automobile, with a view to automobile safety. No other product of such personal impact or of potentially lethal consequences is unregulated by Congress. Even chemicals which are used in the process of manufacturing containers have to be cleared by the FDA. I cannot, personally, see that the automobile industry has done anything on its own with respect to designing a car that is safer. A Model A Ford had a bumper that would very effectively absorb the impact of a crash at considerably more than 5 miles an hour—and some of today's cars have no bumper at all across the center of the car. Indeed, if you look at the cars going up and down the street today, you will see that many of them have a grille that is designed more like a battering ram or a meat cleaver. Additional examples could be listed for several pages.

The argument that competition alone will produce cars less vulnerable to damage is clearly without merit. You will recall that Mr. McNamara, when he was President of Ford Motor Company, emphasized safety in his sales campaign, and was ridiculed at the time for selling safety instead of automobiles. Unfortunately, the sales of Ford Motor Company make it abundantly clear that safety did not sell a car.

A massive injection of Congressional control is required at the present time, not only for the welfare of the consumer, but also to restore—or perhaps establish for the first time—a needed balance of power as between Congress and the motor car industry. In establishing standards for auto safety, while it is clear that standards should not be set which are obviously not attainable, it is also clear that the much-vaunted talents of the motor car industry should be adequate to produce a very substantially safer car than is currently the case.

Yours very truly,

KARL H. SPAETH.

BARRICK, JACKSON, SWITZER & LONG,
Rockford, Ill., May 11, 1971.

Re "No-fault insurance"

SENATE COMMERCE COMMITTEE,
U.S. Senate,
Washington, D.C.

GENTLEMEN: I am deeply distressed at the snowballing effect that has transpired concerning no-fault insurance, and particularly the proposal of Senator Hart.

In the more than 18 years that I have practiced law I have represented both injured parties and defending insurance companies, as well as uninsured defendants. I am thoroughly and completely convinced that no-fault insurance is a mistake. Amongst its shortcomings are as follows:

1. The costs will increase rather than decrease. We have heard a lot of talk about large verdicts and increase in costs, etc., but whenever anyone who is injured, hears of no-fault, there will be probably several hundred thousand more claims paid than are now paid. I have heard an estimate of slightly in excess of a million more claims each year. In addition, I am sure this will not bring about the hoped-for decrease in law suits and court congestion.

2. An innocent injured person will not be able to secure from the guilty driver the intense pain and suffering and other losses beyond merely the cold, hard medical bills and wages unless they exceed an arbitrary set figure. This is a penalty which should not be imposed upon the innocent victim and also creates a temptation to persons to inflate claimed medical bills and claimed lost wages. It even promotes more than we already have to malingering of an injured person. Why should he return to work if he can stay home and thus get over the minimum amount of lost wages necessary to permit him to collect even more money.

3. The system completely destroys a basic concept in America, that of a wrong-doer having to pay for his wrongs. Why, oh please why, should we

1955

eliminate our basic legal concept that an individual who causes an injury to another one must be called to account for his negligence or fault?

4. Why should a reckless or negligent driver be permitted to escape the consequences of his recklessness or negligence which results in injury to other persons?

I sincerely hope that this proposal is soundly laid to rest immediately. I implore you to consider the devastating and far-reaching and even unknown consequences of the adoption of such a proposal.

Thank you for your cooperation.

Very truly yours,

WILLIAM C. JACKSON.

[Telegram]

COLUMBIA, S.C., May 11, 1971.

SENATOR PHILLIP H. HART,
Senate Office Building,
Washington, D.C.

DEAR SIR: In being an insurance agent, for life, health and accident for six years, I have had to settle many claims unfairly. Then in February of 1968 I was involved in a near fatal accident which was no fault of mine. In my deficit and medical bills which totaled \$24,011.98 by March of 1970 I was forced to settle for \$23,828. net. My attorney received \$8,125 net for almost doing nothing because I was informed that I would be awarded no more. Now after being in the hospital nine times, two operations and \$60,000 medical bills incurred already and at a minimum it is still costing be \$400 every 3 months. Being on total disability of \$160 per month it seems I have no further recourse against the defendant's insurance company.

In South Carolina liability insurance is compulsory and it has become a political football. The lawyers and legislators which some of the lawmakers has insurance first of their own and the bar association work with the insurance companies against a no-fault or fixed-premium for the insurance company. I hope this will help out in the federal intervention of the insurance companies for their unfair settlements. If it is necessary when able I will even come to Washington at my own expense with legal documents to testify before your committee.

Respectfully,

ROSS D. BERRY.

MARINA DEL REY, CALIF., May 13, 1971.

HON. PHILLIP HART,
Senate Office Building,
Washington, D.C.

DEAR SENATOR: Your efforts with respect to no-fault insurance are to be commended. I am an attorney, and am somewhat chagrined by the bread-and-butter reactions to your plan, on the part of some of my colleagues. In spite of their protests, trial attorneys can make a living by litigating matters other than automobile accidents.

I would also endorse your efforts in the Commerce Committee with respect to auto safety—i.e., automobile bumpers. My parents 1964 Chevrolet was hit in the rear some years ago, by a taxi travelling approximately 10 m.p.h. The total repair bill was over \$400, and the Chevrolet agency that did the work never really did it properly. The frame, which had been bent, was not straightened, and the tail lights would often short circuit.

Lastly, I would ask you to be among those voting not to divert SST wind-up funds to further production of the two prototypes.

Sincerely yours,

ROBERT R. NIELSEN.

1956

Rehabilitation Institute of Chicago

May 24, 1971

Honorable Warren G. Magnuson
Chairman, Senate Committee on Commerce
United States Senate
Washington, D.C. 20510

Dear Senator Magnuson;

My purpose in writing is to add the endorsement of the Rehabilitation Institute of Chicago to the rehabilitation provisions which are incorporated in pending legislation on motor vehicle insurance now being considered by the Senate Commerce Committee (S. 945, 946 and S. Con. Res. 23). We note that S. 945, of which you are a sponsor, requires that insurance policies shall provide "all appropriate and reasonable expenses necessarily incurred for medical, hospital, surgical, professional nursing, dental, ambulance and prosthetic services" and "all appropriate and reasonable expenses necessarily incurred for physical and occupational therapy and rehabilitation." We should like to lend our support and encouragement to these provisions of the legislation.

I need not point out that our population is increasing, that there are more disabling accidents involving motor vehicles, and there are more heroic attempts at saving these lives. At the RIC we are engaged in rehabilitating those who are saved, but who may sustain extensive injuries and disabilities. Total rehabilitation care should be made available immediately to those who need it. Often this is a crucial factor in lessening the extent of the disability. It is encouraging, therefore, to find legislation that recognizes the very costly and time-consuming nature of this rehabilitation care and provides for it without undue delay and complications.

We greatly appreciate this opportunity to comment on this legislation.

Sincerely,

James O. Heyworth
President

THE AMERICAN OCCUPATIONAL THERAPY ASSOCIATION, INC.
251 PARK AVENUE SOUTH, NEW YORK, N. Y. 10010 • (212) 777-5890

May 28, 1971

The Honorable Warren G. Magnuson
Chairman, Committee on Commerce
United States Senate
Washington, D.C. 20510

Dear Senator Magnuson:

The American Occupational Therapy Association would like to record its support of the rehabilitation provisions contained in S.945, S.946, and S.Con.Res.23, bills regarding "no-fault" motor vehicle insurance.

The membership of The American Occupational Therapy Association includes over 10,000 registered occupational therapists and certified occupational therapy assistants. As health personnel directly involved in providing medical care to the many thousands of individuals injured annually by motor vehicle accidents, we would like to call your attention to the following:

Motor vehicle accidents are probably the greatest single cause of injuries requiring extensive rehabilitative and restoratory care. They produce a shockingly high number of spinal cord injuries each year, resulting in paraplegia (permanent paralysis from the waist down) and quadriplegia (permanent paralysis from the neck down). Auto accidents are the cause also of large numbers of amputations, extensive and often permanent damage to vital joints, internal injuries so severe that they are disabling for years or for life, and a great variety of other serious handicapping conditions.

The care required involves long periods of time in expensive hospital facilities, a vast array of medical equipment and devices (some of which must be custom-made), and the services of many types of health professionals. The amount of money required is usually far beyond an individual's or family's financial means, even with the assistance of hospital and medical insurance. If the injured person is the family's bread-winner, financial problems are obviously compounded.

1958

The tragedy of accidental injury should not be unduly complicated by financial distress. To be most effective, total rehabilitation of the injured should proceed promptly, without delay due to financial problems. Large numbers of our professional occupational therapists work daily with patients who are the victims of these accidents and they see first-hand the results of neglect after injury, and particularly delays after the acute stages, because of the lack of an adequate system for paying the costs of full restorative care.

It is heartening, therefore, to note that the several measures now being considered by your committee embrace the concept of adequate coverage for total rehabilitative care for victims of accidents involving motor vehicles. We should like to endorse those provisions which provide coverage for "all appropriate and reasonable expenses necessarily incurred for medical, hospital, surgical, professional nursing, dental, ambulance, and prosthetic services" and "all appropriate and reasonable expenses necessarily incurred for physical and occupational therapy and rehabilitation."

We appreciate your action toward finding a better solution for these problems which are so devastating to so many of our people.

With our good wishes,

Sincerely yours,

(Mrs.) Harriet Tiebel, O.T.R.
Executive Director

MOTOR AND EQUIPMENT MANUFACTURERS ASSOCIATION

MEMA BUILDING, 304 WEST 50TH STREET, NEW YORK, N. Y. 10019 CODE 212 PHONE 265-4544

WILLIAM A. RAFTERY
EXECUTIVE VICE PRESIDENT

May 28, 1971

The Honorable Philip A. Hart
Chairman
Subcommittee on Antitrust and Monopoly
Committee on Commerce
United States Senate
Washington, D. C. 20510

RE: S. 976 -- "Motor Vehicle Information and Cost
Savings Act"

Dear Senator Hart:

I am writing this letter on behalf of the Motor and Equipment Manufacturers Association (MEMA), which I serve as Executive Vice President, concerning S. 976, the "Motor Vehicle Information and Cost Savings Act." The Association requests that this letter be made a part of the official record of the Hearings on the bill held by the Subcommittee on Antitrust and Monopoly.

As you know from our previous submissions to and testimony before your Subcommittee, MEMA is composed of over 500 manufacturers of automotive parts, equipment, chemicals, accessories and tools, with plants located throughout the United States. As the trade association for the manufacturers of these automotive products, MEMA's membership is comprised of the producers of virtually every piece of equipment that is employed in, on or in connection with the servicing of motor vehicles. Some of these suppliers sell in the aftermarket only, some sell original equipment only, while still others sell both channels.

The provisions of S. 976 treated by this letter deal primarily with those providing for a nationwide system of diagnostic inspection stations and the promulgation by the Secretary of Transportation of property loss reduction standards.

MEMA is in full agreement with the bill's objective of reducing motor vehicle property damage and, as you aptly stated in your remarks when introducing the bill, the frustration felt by automobile owners when lengthy and expensive repair work is necessary though we believe that certain aspects of the bill can be fairly interpreted as not being directly safety-related. However, we cannot give our unqualified support to certain approaches suggested in S. 976 to accomplish these worthwhile objectives.

It must, of course, be recognized that support of this bill must also involve a commitment by the Congress to provide the necessary funds for implementation of it.

Section 501(a) of the bill requires that there be an inspection of a motor vehicle whenever title is transferred for purposes other than resale, or when the vehicle sustains damage of a safety-related mechanism. In general, the inspection must be conducted by a state-certified inspector who receives no compensation from a motor vehicle related business. Such an inspection procedure should, of course, serve as an adjunct to motor vehicle surveillance (inspection) programs which appear vital for implementation of vehicle-in-use standards which, unfortunately, have not as yet been adopted by the Department of Transportation.

Based upon available data, MEMA has been an advocate of periodic motor vehicle inspection, and until such time as contrary data is developed, we will continue to support this position. We suggest that the bill be expanded along these lines. A comprehensive motor vehicle inspection program for noise and air pollution, radio interference and sound suppression, in addition to the primary safety requirements, should, in our judgment, also be required since these are related areas in which the public has a justifiable interest. S. 976 does not provide for such a comprehensive program, however, but in fact limits the inspection program by requiring only post-crash and presale safety inspections. If these inspections are mandatory, it is reasonable to assume that neither state legislators nor the public will press for further comprehensive inspection programs. This problem is complicated by the uncertain meaning of "safety-related mechanism," since this would undoubtedly be interpreted differently by many states. It might also serve to encourage motorists not to report minor accidents so that they could avoid the otherwise required vehicle inspection.

The restrictive language in the bill pertaining to state-certified inspection stations should, we feel, also be amended. It seems reasonable to assume that an automotive repair outlet would encourage its inspectors to find defects during an inspection so that the outlet could also obtain the repair work. This is a problem which should concern anyone who drives a car. However, we do not believe that it is feasible for the federal government to prohibit inspections by these businesses. The bill recognizes the problems presented by lack of inspection facilities and capabilities in sparsely populated rural areas; however, there are many areas where mechanics and potential inspectors are in such short supply that a state would have difficulty operating its own inspection stations. In addition, a state may find the monetary investment in buildings, equipment and personnel prohibitive.

MEMA believes that the foregoing problems suggest that section 501 of the bill should be amended so that a determination of when and where vehicles shall be inspected is left to the individual states. Perhaps minimum requirements could be included which require states to insure that every motor vehicle is inspected at least annually for safety, noise and air pollution, radio interference and sound suppression, by a state-certified inspector.

Such minimum requirements would leave each state free to require additional inspections if it felt this necessary, and to specify when such inspections should occur. Further, it would permit a state which was hard pressed either for inspectors or funds to operate a state inspection or state-certified inspection program which met its own particular needs, within the minimum requirements of applicable federal legislation.

In the long term, MEMA is of the view that comprehensive changes should take place in vehicular inspection programs. I have discussed with officials of both federal and state governments, industry representatives and consumer representatives, the possible formation of a quasi-governmental corporation, structured along the lines of COMSAT and the newly formed Post Office Department. State governments will in the future be relying more and more heavily upon the resources of the federal government in this as well as other fields. Briefly, I urge that a study be undertaken to confirm the apparent advantages of forming such a corporation. This corporation would be initially funded (capitalized) either through the sale of federal bonds or through private capital (guaranteed by the Government), to develop research data and inspection program procedures for the inspection of all motor vehicles, with regard to their safety systems as well as noise and air pollutants, radio interference and sound suppression. It would, of course, work closely with such government agencies as the National Highway Traffic Safety Administration, the Environmental Protection Agency, the Federal Communications Commission and any other involved federal or state agencies. Such a corporation could develop inspection programs and offer them on a "franchise" basis to the individual states, the latter determining the type of franchise each would prefer, such as private inspection stations, government stations, mobile stations, etc. The franchise would, among other things, include inspection procedures, training of inspectors, and the improvement of inspection methods and equipment. As a "franchisee" the individual state would, in turn, pay this corporation on the basis of a pre-established fee per vehicle inspected. These inspection fees in many cases are already included in registration and license fees but, unfortunately, all too frequently the funds are diverted to other uses. I am therefore proposing that such a program would be financially self-sustaining without the need for further substantial financial commitments from the Congress.

We recognize that the development of such a corporation would involve extensive preparatory studies, and it is for this reason that we are making suggestions relating to the inspection provisions of S. 976 which can be implemented in the short run. We did, however, want to bring this idea to your attention, and felt that this letter was an appropriate medium in which to do so. I am, of course, available to discuss the concept and functions of such a government-sponsored corporation as has been outlined above, with you or your staff, so that a detailed proposal can be developed along these lines, should you desire to pursue this area further.

Before closing we would like to comment briefly on section 125 of the bill. Again, MEMA applauds your attempts to lessen the damage which occurs during minor accidents. However, we believe that any statutory authorization for vehicle standards dealing with property damage should clearly specify that

no such standard should jeopardize motor vehicle safety. Further, the inclusion of both safety and property damage standard authorizations in the same statute could very likely cause undesirable confusion on the part of the National Highway Traffic Safety Administration as well as automobile manufacturers. We also believe that such legislation should specify that the resultant cost to the car purchaser should be considered before any standard is enacted, so that new car prices do not rise so substantially that any decrease in repair costs becomes insignificant or is obscured entirely in the tradeoff between new car prices and vehicle in use repair costs. Further, we suggest that the bill should carefully distinguish, as it does not presently do, between passenger cars, trucks, buses and multipurpose passenger vehicles.

Finally, MEMA submits that Congress should not act as a standards' writing authority. Consequently, we believe that section 125(c), establishing minimum bumper damage performance standards, should be deleted. The Department of Transportation's bumper safety standard, although not as stringent as the S. 976 requirement, becomes effective more than two years before section 125(c)'s proposed effective date. The earlier effective date should act as a compensating factor for the somewhat weaker requirements under the DOT standard. In addition, as noted by former National Highway Safety Bureau Director Dr. William Haddon, Jr. in his testimony before your Subcommittee, writing such a standard into legislation serves to "freeze technology" and should be avoided if at all possible.

* * * * *

MEMA appreciates this opportunity to present its views on S. 976. The Association shares your continuing interest in automotive safety and the all too frequent, frustrating situations in which the automobile owner finds himself. The changes which we have recommended in S. 976 do not involve the bill's intent or purpose, but only the proper method of implementation.

Sincerely,

 William A. Rattery
 Executive Vice President

Dear Senator Hart:

As an independent diagnostic center who does not make repairs, we have been following, with interest, the Committee Hearings on your Hart-Magnuson Repair Bill.

Testimony in opposition to this section of the Bill has been erroneous and extremely self-serving. We can state from four years of experience and prove that:

- 1) Independent diagnostic inspection can be conducted promptly, professionally, and profitably.
- 2) The best diagnosticians are not drawn from the ranks of skilled mechanics since the nature of diagnostic inspection is completely different from the skills required in overhaul and repair.
- 3) In truth, it would do considerable toward relieving the problem of good automotive mechanic shortage by eliminating the costly "do over" time and diagnostic time which consumes so much of a mechanics time presently.

Independent diagnostic centers would go a long way toward curing the complaints of overselling, overcharging, and unnecessary repairs which are the greatest evils in the automotive repair business today.

It will also reduce the smog problem and help cut down on highway accidents. As a matter of interest, we took a random cross-section of automobiles checked out by our diagnostic service and found that 70% of them had smog equipment defects; 80% had one or more safety defects; and 30% had muffler-exhaust problems.

We have operated successfully and profitably in the Riverside-San Bernardino Metropolitan area (population 250,000) for over three years. During that time, we have participated in Department of Transportation Highway Safety Research, and in Mechanic Training Programs for the U.S. Government. For these reasons, we feel that our viewpoint is based on considerable experience, as opposed to the theoretical opinions previously expressed before your Committee.

Please feel free to call on us if we may furnish any further information to you or your Committee.

Sincerely yours,

RIVERSIDE AUTO LAB, INC.

Senator Philip Hart
Senate Office Building
Washington D.C.

Dear Senator Hart:

I testified along with Mr. Charles Rue for the Independent Mutual Agents of New York, New Jersey, and Connecticut on Friday, May 14. Your aide in the cross examination asked me a question regarding whether we would like auto to be primary or whether we would accept a federal hospitalization plan as primary. At that time I indicated that I thought we would. However, on reflection I must change my opinion.

From a philosophical view point we have always been in favor of the automobile paying its own way. However, one further thought has occurred to me in that the automobile is one of our major sources of air pollution along with other attendant problems. It seems ludicrous for us to spend millions of dollars to clean up air pollution and then to talk about encouraging the use of the automobile by shifting the insurance burden to the general population as a whole rather than the owners of the vehicles. For this very same reason I would have to be fundamentally opposed to your bill which advocates tax credits for employee mass merchandising programs. I feel much more should be spent in attempting to improve the rapid transit facilities of the country and in saving the existing railroad system and I do not see how, with any sense of priorities, we can turn around and encourage any further utilization of the automobile beyond that which is absolutely necessary.

Very truly yours,

RE: Public Hearings S. 945, S. 946, S. 976
and S. Con. Res. 23
Auto Insurance Reform

Dear Senator Magnuson:

We understand that the Senate Commerce Committee held the last day of hearings on the above subject bills dealing with auto insurance reform on Friday, May 28th and that the hearing record will be held open for additional statements for ten days from such date.

The American Automobile Association supported Congressional Resolution calling for the two-year study by the Department of Transportation into all aspects of automobile insurance. We have carefully analyzed interim and final study reports and findings by the Department of Transportation.

The AAA Executive Committee, the later part of last month, approved a policy position on this subject which is herewith set forth.

"AUTOMOBILE INSURANCE AND ACCIDENT COMPENSATION

The American Automobile Association has a profound and continuing interest in the general availability of auto insurance that provides fair and equitable protection against economic loss and suffering resulting from motor vehicle accidents.

The AAA analysis of the study findings of the Department of Transportation confirms the immediate need for positive action to correct the present automobile accident compensation system.

1966

AAA believes that private enterprise in a competitive market can best provide the quality of insurance protection required by the public. The AAA also supports continued State regulation of auto insurance to insure maintenance of a system which is responsive to local needs.

AAA advocates and calls upon the state legislatures to enact an auto insurance compensation system which embraces the following principles:

- A) Basic benefits, within limits prescribed, should be payable to the injured person by his own insurance company without regard to fault.
- B) Such basic benefits should provide coverage for the insured, resident relatives of his household, his guest passengers, and pedestrians struck by the insured automobile.
- C) Such basic benefits should provide compensation for economic loss without regard to fault, subject to reasonable deductibles and limits, including the costs of medical care, hospitalization and wage losses. Insurance companies making such payments should be entitled to reimbursement by the responsible party or his insurer, with the requirement of inter-company arbitration between insurers in appropriate cases. So far as possible, claims other than basic benefits below a stated amount should be arbitrated.
- D) Recovery by an injured party for any loss already covered by basic benefits should not be permitted in any private action for damages.
- E) Reasonable standards for pain and suffering damages should be established.
- F) Reasonable regulations limiting contingent attorney fees in auto accident cases should be established.

The AAA recognizes the problem of protecting persons justly claiming against insolvent automobile insurers. AAA supports speedy enactment at the state level of legislation to provide for assessment of sufficient funds to cover such losses from other automobile insurers doing business in such state after the insolvency has occurred."

It is requested that this letter be made a part of and be included in the committee's printed hearings.

Sincerely yours,

John de Lorenzi
Managing Director
Public and Government Relations

1967

WHITE MOTOR CORPORATION

100 Erieview Plaza · Cleveland, Ohio 44114 · Area Code 216 / 523-3800

June 11, 1971

Senator Phillip A. Hart
Senate Commerce Committee
Room 5202
New Senate Office Building
Washington, D.C. 20510

SUBJECT: Senate Bill 976
Motor Vehicle Information and Cost Savings Act

Dear Senator Hart:

The White Motor Corporation is a diversified manufacturer of motor trucks, farm and construction equipment, and industrial power. In the case of motor trucks, we manufacture and/or distribute vehicles with a gross vehicle (total of chassis, body and payload) weight of approximately 24,000 pounds and up only.

This letter is intended to express our concern with certain provisions of the subject bill which would apparently be applicable to heavy trucks of the type which we manufacture and/or distribute. It is our opinion that the bill is primarily intended to bring about a reduction in the reported high repair costs of automobiles that are damaged in accidents occurring at relatively low vehicle speeds. However, the bill refers to "motor vehicles" in certain of its provisions, with the result that, in addition to automobiles, other types of vehicles, including heavy trucks, would be subject to these provisions.

Heavy trucks may be defined as those falling in gross vehicle weight classes 6, 7 and 8 which have gross vehicle weight ratings of 19,501 pounds and up. It is important to recognize that these G.V.W. classes represent a relatively small percentage of the total motor vehicles produced. Table I entitled "Motor Vehicle Factory Sales - By Type" shows the 1969 and 1970 total factory sales of motor vehicles by types. The total truck factory sales represent approximately 19-20% of the total vehicle production and represent a reasonably substantial number of vehicles.

However, Table II entitled "Truck Factory Sales - By G.V.W. Classes" provides data on the 1969 and 1970 factory sales of trucks by gross vehicle weight classes. It will be noted that G.V.W. classes 1 and 2 which have gross vehicle weight ratings of 10,000 pounds and less, represent approximately 81% of the total truck production, and that G.V.W. classes 6, 7 and 8 with gross vehicle weight ratings of 19,501 pounds and up, represent but approximately 14% of the total truck production and less than 3% of the total motor vehicle production. In 1969, total factory sales of such trucks were but 299,241, and in 1970 267,169.

Table III, "1970 Truck and Bus Factory Sales from U.S. Plants by Body Types and G.V.W." indicates that, after deducting buses, less than one percent of the total quantity of trucks in G.V.W. classes 6, 7 and 8 were produced as completed trucks. In other words, less than 2,000 of such vehicles were produced as completed trucks, with the remainder requiring further manufacture or modification after leaving the truck manufacturing plant.

In addition to this problem, combined with the relatively low total volume of such heavy trucks, there are a wide variety of basic types of such trucks produced. Among the various basic configurations are the following:

1. Types - Conventional; cab forward; cab over engine.
2. Cabs - Non-sleeper and sleeper; 2 and 3 man; half cabs; crew cabs, etc.
3. Front Axle Position - Front axle positions relative to the front bumper vary substantially from a minimum of approximately 25" to a maximum of approximately 100".
4. Types of Engine - Gasoline, LPG and diesel in a wide range of types, number of cylinders and horsepower output.
5. Gross Vehicle Weight Ratings - From 19,501 pounds up to approximately 80,000 pounds.
6. Number of Axles - From two to five.
7. Bumper to back of cab dimensions - Cab over engine and cab forward range from approximately 48" to approximately 104". The conventional models range from approximately 90" to approximately 156".

With these wide variations in basic configurations, the production of any one basic type of vehicle is necessarily limited. Furthermore, to meet the varied operating conditions encountered, it is necessary for each heavy truck manufacturer to offer a wide variety of standard and optional specifications in each basic configuration.

The above data have been provided to serve as background information in connection with the following specific comments and recommendations. One of our major concerns deals with the provision that all motor vehicles manufactured on or after a certain date and offered for sale in the United States must be designed and constructed with energy absorbing bumpers capable of withstanding impacts front and rear at fairly low speeds into a solid fixed barrier with a minimum prescribed amount of damage as may be determined by the Secretary of the Department of Transportation.

We strongly recommend that the term "motor vehicle" be deleted from this provision and the term "passenger car" or "automobile" be substituted. Our reasons for making this recommendation are as follows:

1. Damage to heavy trucks at relatively low impact speeds is limited because of the heavy construction furnished on such vehicles.
2. Because of the limited total production of heavy trucks and the fairly substantial variation in the quantities of specific types of heavy trucks, the volume in which certain parts of these vehicles are produced varies rather widely. Furthermore, the amount of tooling that can be justified on an economic basis varies with the volume, so that the cost of parts which may require replacement will also vary widely. As a result, it is not practical to establish a "minimum prescribed amount of damage" for such vehicles.
3. The cost of many heavy trucks ranges from \$15,000 to \$25,000. This fact, combined with the wide variety and the limited volume of each heavy truck type, would result in a severe economic burden on the manufacturers of such vehicles without any compensating benefit to the purchaser of such heavy trucks.
4. The amount of energy to be absorbed by the bumpers on heavy trucks would be exceptionally high, since gross vehicle and/or combination (with trailer) weights will range up to 80,000 pounds (and even more when operated under special permit.)
5. Trucks and combination vehicles are subject to specific overall length restrictions. The use of energy absorbing bumpers would require increases in permissible overall length, or in the absence of such increases, would result in reducing the cargo space available, adding a severe economic penalty to the operation of such vehicles, since, in practically all truck freight operations, the pay load that may be hauled is limited by available cargo space, rather than by weight restrictions.
6. Most heavy trucks are built to suit the specific requirements of the purchaser and will often include one or more items of equipment or specification variations that are specially engineered for that specific vehicle. As a result, many of these custom-built trucks are produced by relatively small manufacturers, with fairly small total production consisting of many varieties. The economic burden of the proposed requirements would fall most heavily on these smaller manufacturers.

7. As pointed out above, less than one percent of the heavy trucks are built as complete vehicles. As a result, most such vehicles are equipped with a body and/or other equipment after they leave the truck manufacturer's plant. Since the rear bumper could not be properly located or mounted until after the body and/or equipment are mounted on the incomplete vehicle, it would become the responsibility of the body and/or equipment supplier to install the rear bumper and to assume the responsibility for conformance with the proposed requirements.
8. Most body and/or equipment suppliers are relatively small manufacturers who do not have the facilities, technical background nor the technical manpower to conduct the necessary tests to assure conformance with the proposed requirements. Furthermore, since such suppliers mount bodies and/or equipment on many makes and types of heavy trucks, they would be faced with the necessity of testing a substantial number of completed vehicles in relation to their total production of such vehicles.
9. Finally, since property damage to heavy trucks involved in accidents at relatively limited speeds is not a problem, there is no necessity for making this provision applicable to heavy trucks.

For the same reasons, it is recommended that any reference to proposed property loss reduction standards included in the bill apply only to "passenger cars" or "automobiles" instead of to "motor vehicles."

We are also concerned with respect to the requirement that no motor vehicle inspector may be certified by any State if he owns or receives any benefit in or from a business or enterprise engaged in the repair or sale of motor vehicles, automotive repair parts or accessories. At present, many of the larger truck fleet operators are performing their own inspections which are required under many State programs. Our interpretation of this proposed provision is that inspections by employees of such fleet operators could not be continued.

If this interpretation is correct, we strongly recommend that the language of this provision be revised to permit the continuation of self-inspection by such fleet operators. Any change from such procedures would result in a severe economic burden being placed on these operators. In addition, the facilities for inspecting heavy trucks are limited and in many instances, located many miles from the locations where the trucks are domiciled.

We will appreciate your consideration of our recommendations. If we can supply you with further data, please let us know.

Very truly yours,
WHITE MOTOR CORPORATION

The Honorable Philip A. Hart
Vice Chairman
Sub-Committee for Consumers
Committee on Commerce
U. S. Senate
Washington, D. C.

Dear Senator Hart:

As a supplier of blowers and propellers to the central residential air conditioning manufacturers, as well as manufacturing residential humidifiers, we are aware that your committee is considering legislation which would establish federal standards for warranties. We believe the purpose that lies behind your effort to protect the concerns of the consuming public should be supported. There are several suggestions, however, which we hope your sub-committee will still have time to consider.

We urge the inclusion of the strongest legally permissible federal preemption provision in Title I of S. 986 in order that chaos resulting from having differing requirements in all of the states can be avoided. Failure to preempt would be chaotic from the point of view of a manufacturer's activity, but it would inevitably add to the cost of products to the ultimate consumer.

Unlike manufacturers of other types of appliances, a unique situation exists in the central residential air conditioning industry. The contracting installer is, in fact, the manufacturer who designs and installs the system in the home. As a result, contracting installers should be recognized in the legislation as the warrantor backed up by product warranties of the manufacturers of individual components which the contractor selects, such as furnaces, air conditioners, sheet metal for duct work, registers and grills, etc.

Your favorable consideration is also urgently requested of a separation of Titles I and II in order that further and more detailed consideration may be given in separate hearings to the proposals for strengthening the Federal Trade Commission.

Your regarding the foregoing as constructive comments will be appreciated since it is our purpose to be helpful in your effort. Should there be the opportunity for us to make a further contribution, we request that you afford us such an opportunity.

Respectfully yours,

William W. Morrisey

Senate Commerce Committee
Room 127
Old Senate Office Building
Washington, D. C. 20510

Gentlemen:

Attn: S. Lynn Sutcliffe, Counsel

Re: Senate Bill 976

I would like to comment on Senate Bill 976 and more particularly on Section 501 (a) (2) of Title V which would prohibit service station dealers from conducting motor vehicle inspections. This provision would cause duplication of investment in testing equipment and facilities, gross inconvenience to motorists and economic discrimination against service station dealers.

The proposed system would require new facilities to be built to conduct tests in the many states where tests are now conducted in service stations and other existing establishments. Thus, the economy would be inflated by the needless construction of new facilities to provide services already supplied by existing operations. It would also require duplication of investment by repair shops and testing stations in testing equipment. (If this equipment were not installed in repair shops, they would have no way of knowing if their repairs had succeeded in bringing the automobile's repairs up to standard.)

These new testing facilities would not be able to operate except by charging very high fees or by virtue of increased state taxes as substantial income will be required to support the facilities and the manpower needed to test vehicles on a schedule that would be quick and convenient to motorists.

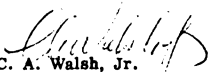

Many service station dealers today derive fees from performing inspection services and provide convenient one-stop service for inspections and repairs to those motorists who desire it. Of course, if a motorist prefers to have his car repaired at a garage or service station other than the one which conducts the test, he is now free to do so.

Under the proposed system, this convenience to the motorist would be destroyed. Motorists would be forced to go to one place for a test

and if repairs were needed, to go to another location to obtain repair work, and then return again to the testing facility. Coupled with this of course is the discrimination in the bill against many, many independent service station dealers who would be deprived of a much needed source of income.

Today service station dealers are trying to remain in business in the face of severe price wars, and motorists are increasingly dissatisfied with the inconvenience of repairing automobiles. Section 501 (a) (2) of Title V would aggravate these problems. To rectify these weaknesses of the present bill, I would suggest that the bill be amended by deleting that part of Section 501 (a) (2) that begins with the words "No motor vehicle inspector" and continues to the end of this subsection. In lieu thereof, you might wish to insert a provision stating that "Each state shall institute an audit and inspection program to protect the public from any misconduct by licensed inspectors."

RESOLUTION

WHEREAS, Senate Bill 976, a bill to amend the National Traffic and Motor Vehicle Safety Act of 1966, provides under Title V, Section 501 in part as follows: "No motor vehicle inspector may be certified by any state if he owns or receives any benefits in or from a business or enterprise engaged in the repair or sale of motor vehicles, automotive repair parts or accessories;" and

WHEREAS, almost two thousand small businessmen of Georgia including more than five hundred gasoline and automotive service stations have invested substantial sums in equipment to meet minimum requirements to become an "approved inspection station" under Georgia's Vehicle Inspection Law; and

WHEREAS, adequate safeguards have been provided for in Georgia Law which may be strengthened as needed from time to time to protect the motorists; and

WHEREAS, the best interest of the tax paying motorists is served by the preservation of the free enterprise system of this State and Nation; and

WHEREAS, there is substantial value to motorists in the convenience provided under Georgia's Vehicle Inspection Law by the number of locations within easy access including the freedom "to select" their choice of an inspection station within their community; and

WHEREAS, a governmentally operated vehicle inspection facility would cost the tax payers an enormous sum for the initial facilities and equipment plus a continuing additional cost to many taxpayers for time and travel to and from a few scattered inspection stations; and

WHEREAS, passage of Senate Bill 976 as now worded would bring substantial economic harm to Georgia motorists and those who are presently "approved" as Vehicle Inspection Stations, now therefore

BE IT RESOLVED by this Board of Directors of the Nation's largest state oil industry trade association, THE GEORGIA ASSOCIATION OF PETROLEUM RETAILERS, with a membership of almost 3,000 small business gasoline and automotive service station operator members, that we respectfully request that that portion of aforementioned Title V- Section 501 of Senate Bill 976 and any other portions related thereto be removed from said proposed law so as to reserve to the sovereign State of Georgia its right to operate a vehicle inspection program in accordance with the will of the people; and

IT IS ORDERED that a copy of this Resolution be immediately transmitted to the members of the United States Senate Committee on Commerce and to each of Georgia's Congressional Delegation.

Adopted this 15th day of June, 1971.

BLOOMFIELD HILLS, MICH., June 30, 1971.

CHEVROLET MOTOR DIVISION,
GENERAL MOTORS CORP.,
Detroit, Mich.

Attention: Customer Relations.

GENTLEMEN: Ironically, on the very same day on which the enclosed item appeared in the Detroit Free Press Action Line, an almost identical incident happened at our house—only my car is a new Chevrolet—a 1971 Chevelle Malibu, purchased from Matthews-Hargreaves in Royal Oak on April 30. Our sixteen year old son closed the door on the driver side in "lock" position, but failing to slam it hard enough to make it catch completely he nudged it with his hip and put a depression in the door just in front of the door handle.

I find this absolutely appalling—first of all, the very nature of the mishap! To be able to so easily dent the body of the car (incidentally, the hip didn't even bruise!)—what feeling of safety can we possibly have riding in it? Then, the cost of repair as shown by enclosed estimates of \$39.12 from Matthews-Hargreaves and \$40.16 from Mike Savoie seems ridiculous, when, as in the case of the Buick, the paint isn't scratched nor does it show anything but a rounded depression with no sharp creases.

Have purchased nothing but Chevrolets since 1941, I find it hard to believe that this new model is going to be so fragile—and expensive. For our \$3300.00 and some odd dollars, I am beginning to wonder *what* I got!

Thank you for whatever help you may be in this incident.

Very truly yours,

ALICE M. ALLAR.

Enclosures.

When my mom's new Buick Skylark was only 10 days old, she put a four-inch dent in the door. You won't believe how. She had her hands full of packages, and slammed the door shut with her rear end. She only weighs 180 pounds, and the dealer refuses to believe that's how she did it.—S.F., Westland.

Mom can forget body shop bill for \$36. Harold Dietrick Buick in Wayne agreed to pay tab even though it said "nothing like this has ever happened." Sales manager Lee Bender couldn't believe dent was caused by mom's derriere, said "she must've run into the garage." Reason paint wasn't scratched, he explained, was because "that's very tough paint." Insurance Institute for Highway Safety reports that a side crash at 10 mph would cause \$174 worth of damage to a Buick Skylark. Be glad mom didn't back into the front end. Bill for front end damage at 10 mph would be \$354.

June 8, 1971

Honorable Warren G. Magnuson
Chairman, Committee on Commerce
United States Senate
Washington D. C.

My dear Senator Magnuson:

Reference: S.976

We are most interested in all activities that will promote and improve the safety of the increasing millions of people using our roads and highways. As concerned citizens, we are also most interested and concerned in these safety problems as well as in the costly methods proposed to solve some of the minor aspects of the overall problem.

Omark Industries, Inc. has developed and thoroughly tested a simple, three-piece, all metal, energy absorbing fastener that connects the bumper to the car frame. This unique design gives the car manufacturer a great deal of flexibility in the selection of the fastener size, cost, capacity, mounting arrangements, number used, and structure design. These small units are also relatively insensitive to a wide range of climate and road conditions. The Omark unit absorbs energy during impact at force levels that are predictable and uniform so that deceleration forces on the car and its critical system can be held to safe limits.

These units can be supplied now in large production quantities by my company on short notice.

Our tests have been conducted in our own laboratories as well as at the Automotive Research Associates in San Antonio, Texas. Using a special front bumper and mounting brackets with two Omark Energy Absorbing units, a 4500 pound car has been impacted 24 times into a standard S.A.E. barrier at speeds up to 12 miles per hour. The vehicles' sheet metal and safety systems were always protected and always drivable after impacts. A film of these tests is available.

.

During the past six months, Omark employees have personally presented this bumper Energy Absorption concept to the principal automobile manufacturers in the United States, Europe, Japan and Australia. Most have expressed real interest in the concept because simple metal parts are used which are low in cost and size yet are highly efficient (95%) in their ability to absorb energy.

Concern has been expressed by each manufacturer, however, because of the current Department of Transportation bumper standard which specifies that 1974 model cars shall be tested front and rear with a total of 16 pendulum impacts and that no adjustment or replacement of parts may be made between impacts.

We feel this recycling requirement is not realistic with the nature of low speed (5 mph) impacts in real life. Published data indicate that the average car in the United States may be involved in such an accident about once in every 14 years. Such a requirement with the attendant higher costs is not necessary and creates an exorbitant premium to the U.S. public who buy in the neighborhood of 10,000,000 new cars each year.

The interests of the car owner and operators, the car manufacturers, and the car insuring companies are then best served by that type of Energy Absorber that will provide reliable safety to the car and its critical systems during the normal life of the car and provide this safety at the lowest cost.

By replacing our unit between impacts in test or in service, the energy absorbing element of the system will be restored to prime condition and give the service station operator the opportunity to inspect critical systems and to make or recommend repair of any needing attention. The car operator could have high exposure to failure of critical systems impaired by impacts occurring with or without his knowledge.

The Omark replacement-type Energy Absorber will provide real economic benefits to the car owner at the time of initial purchase. Our best estimates of the cost to the vehicle owner of comparable recycling and replacement units indicated 10 to 1 advantage of the Omark type over a competitive recycling one.

We have been advised by a large domestic car manufacturer that our style Energy Absorber can be mounted both on the front and rear with less costly support structures than the other types.

1984

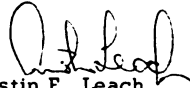

In summary, the current Omark system will provide the required protection to critical systems and mechanisms, the economic benefits are huge, and the Omark system is now designed and ready for providing protection at speeds higher than 5 mph.

In order to take advantage of the inherent benefits of the Omark system, realistic testing procedures of front and rear barrier impacts should be adopted with provisions permitting the replacement of consumed energy absorbing elements between impacts.

We have attached drawings, brochures and an actual sample of an Omark Energy Absorption unit for your examination. Two of these units will stop a 4000 pound car impacting a barrier at 5 mph in approximately 4".

We feel the American public should be given the opportunity to enjoy the technical and cost benefits of this system by a provision in S.976 requiring front and rear barrier impact tests on all new cars beginning with the 1973 models, and with the further provision that the energy absorption element may be replaced after each impact.

Sincerely yours,

Austin F. Leach
Vice President-Corporate Projects

ENERGY ABSORBERS

DRAW LENGTH - INCHES

A system that absorbs energy during impact, protecting the material from damage.

We'd like to introduce you to our energy absorbers.* We believe they are quite an achievement and you may agree. They absorb energy — colossal amounts of it — simply and efficiently. They have a variety of application possibilities where energy must be dissipated reliably in a small space to prevent or reduce injury or damage. They are also force-limiting fasteners that allow you to accurately apply tension.

What are they called?

Well, we don't have a fancy name for them — but they work.

How do they work?

On the wire-drawing principle. A threaded high-strength-steel rod is pulled through a die that permanently reduces the rod's diameter. The plastic flow of metal during drawing absorbs and dissipates energy. The process is analogous to squeezing toothpaste from a tube.

Is this technology new to Omark?

Not at all. We are very comfortable with the plastic-flow concept. Omark has been using it for years in the manufacture of powder-actuated construction tools and rivets.

How efficient are the absorbers?

Approximately 95 per cent. A hydraulic shock absorber subjected to the same maximum load as an Omark EA travels 7 1/2 inches to absorb the energy that ours absorbs in 4 inches.

But that's obviously a constant-force absorber. You may ask: "Can you provide variable-force types?"

Certainly. We can produce virtually any force-deflection curve required.

Has the Omark EA been proven effective?

Yes. Our own engineers and an independent laboratory, Automotive Research Associates, tested the absorbers in automobile-barrier crashes and found them extremely effective at speeds up to 12 miles an hour. Two of them employed in a bumper stopped a 4,000-pound vehicle in a 10 m.p.h. barrier crash. There was no damage to the car.

Were these large absorbers?

No. The ones used in the Automotive Research Associates' tests were 7/16-inch diameter and 8-1/4 inches long. They weighed 1 pound each. Newer designs have reduced their weight to 8 ounces apiece. You can't buy an equivalent energy-absorbing device lighter or smaller than ours. But we can make them in any size.

Are they expensive?

No. The small amount of steel required ensures low material cost. The simple design permits the use of high-speed-precision-manufacturing techniques with little waste. We estimate our devices have a 5-to-1 cost advantage over functionally comparable absorbers. Additionally, their small size and fastening capability can simplify the design of structures in which they are installed. This greatly contributes to reducing the cost of the structure.

* PATENTS PENDING

Are they reliable? Is performance predictable?

They are extremely reliable. The characteristics of steel, which are well known, allow us to determine the strength of the rod. The thread will support twice the rod's drawing force and the die is substantially stronger than the rod. Absorber-corrosion resistance is easily maintained through plating. They can also be made of stainless steel. Our tests show dynamic and static drawing forces are highly predictable.

Are the absorbers difficult to install?

No. Their bolt-like configuration makes them very easy to install. In most cases, a standard wrench is the only tool needed. They can be used for blind-fastening applications, too.

How are they inspected?

Visual inspection reveals when the rods are drawn. Replacement or adjustment is then necessary. If the rod is partially drawn, adjustment is effected by turning the nut which tightens the absorber for reuse. These steps constitute the only maintenance.

How can the absorbers be used?

We've barely scratched the surface and don't know all the answers. But we believe the most promising applications are in bumpers, human safety systems and force-limiting fastening.

The Omark EA is a proven method of reducing automobile damage in low-speed collisions. We see excellent possibilities for the absorber as a railcar-coupler backup system, a truck-trailer underride protection unit, a cargo-protection system for vehicles, railcars and shipping docks and a cushion-landing mechanism for air-dropped supplies.

The Omark EA is ideally suited for use as automobile seat-belt anchors, highway safety-barrier and breakaway sign post fasteners, collapsible mountings for automobile dashboards and collapsible steering columns. We believe the EA could be effectively utilized as overloading indicators, a non-destructive testing device, an inexpensive calibration device for tensile-testing machines, a backup system for aircraft landing gear and cables used to stop planes after landing, elevator safety units, rocket hold-down bolts, structural fasteners for explosion- and hurricane-proof buildings, and spacecraft landing-gear components.

The absorbers, if used as force-limiting fasteners, replace torqued bolts. They allow the user to accurately apply tension. They can be employed to fasten compressors, engine heads, steam lines, turbines, heavy equipment in power plants, and flanges. They also can provide acceleration and deceleration control in ship launching, vessel docking and cable rigging.

We know we've overlooked many applications and invite your thoughts, comments or suggestions. Perhaps you have an application we can evaluate. Omark EA design equations include the effect on drawing force of yield strength, rod and die dimensions and friction factors. The equations have been programmed for our computer and designs can be swiftly prepared for all applications.

We are ready to help in a hurry.

Write Corporate Projects, Omark Industries, 2100 SE Milport Road, Portland, Ore. 97222 or telephone 503-654-6531, ext. 219.

* The force-deflection curve shown on the cover is produced by the energy absorber above, shown in actual size.

1988

WHAT WE MAKE:

Cutting chain and accessories for power saws

Wood harvesting and processing equipment

Hydraulically operated equipment for materials handling

Aerospace tools and fasteners

Machine tools

Stud welding systems

Construction fastener systems

Masonry and concrete cutting equipment

Air control systems

Sporting arms, small arms ammunition and ammunition primers

DIE PLATE. ENTRANCE ANGLE IS FORMED ON BOTH SIDES TO INSURE CORRECT INSTALLATION.

ENERGY-ABSORBER COMPONENTS CAN BE PLATED FOR CORROSION RESISTANCE OR THEY CAN BE MADE ENTIRELY FROM CORROSION RESISTANT MATERIALS.

NOTES TO FINANCIAL STATEMENTS

1. Principles of Consolidation:

The consolidated financial statements include the accounts of all domestic and foreign subsidiaries of Omak. All significant intercompany transactions have been eliminated in these statements.

Assets and liabilities of the subsidiaries, other than U.S. and Canadian subsidiaries, included in the consolidated balance sheet at June 30, 1970 are: current assets, \$6,289,379; property—net, \$2,625,201; current liabilities, \$2,647,355; and long-term debt, \$93,780. The Company conducts a substantial portion of its international operations through U.S. (including Puerto Rican—see Note 3) and Canadian subsidiaries. The Company's equity in the net earnings of other than U.S. and Canadian subsidiaries was \$171,000 and \$357,000 for the years ended June 30, 1970 and 1969, respectively.

2. Inventories:

Inventories are valued at the lower of cost (first-in, first-out basis) or market. Major classes of inventory at June 30, 1970 and 1969 were as follows:

| | 1970 | 1969 |
|--------------------|---------------------|---------------------|
| Finished goods .. | \$15,317,351 | \$ 9,416,551 |
| Work in process .. | 9,496,849 | 10,765,263 |
| Raw materials ... | 4,548,921 | 3,500,080 |
| | <u>\$29,363,121</u> | <u>\$23,681,894</u> |

3. Income Taxes:

The statement of consolidated earnings and retained earnings includes the net earnings of a wholly-owned subsidiary operating in Puerto Rico. The manufacturing income is not subject to U.S. income tax and is exempt from Puerto Rican income tax for a ten-year period ending in May 1975. Under certain circumstances an additional ten-year exemption period may be granted. This exemption from Puerto Rican income tax, at an effective rate approximating 35%, reduced the provisions for income taxes by approximately \$1,550,000 and \$1,000,000 for the years ended June 30, 1970 and 1969, respectively. Any dividend paid to the parent by this or certain foreign subsidiaries would be subject to U.S. income taxes. It is anticipated that earnings of these subsidiaries will be rein-

vested in their operations and no dividends are contemplated.

By stipulated decision entered December 16, 1969 by the Tax Court of the United States, income tax deficiencies due from the Company and certain of its subsidiaries for fiscal years ended June 30, 1961, 1962, and 1963 were determined to aggregate \$245,000, compared with asserted tax deficiencies and penalties amounting to \$2,481,802, both amounts exclusive of interest. Now pending are asserted deficiencies and penalties for the years 1964, 1965, and 1966 in the approximate amount of \$5,900,000, exclusive of interest. The Company and its subsidiaries have provided for deferred income taxes in the amount of \$934,000 available for the 1964-66 asserted liabilities. In the opinion of Baker & McKenzie, tax counsel for the Company, this amount is adequate to provide for the liabilities that may ultimately be determined.

The 1970 provision for deferred income taxes consists of a credit of \$1,480,000 for the future tax benefit arising from 1970 tax loss carryforwards of certain subsidiaries and from expenses not currently deductible for tax purposes, less a charge of \$279,000 (\$125,000 in 1969) for the use of accelerated depreciation for income tax purposes.

4. Profit-Sharing and Bonus Plans:

Under provisions of its profit-sharing plan, the Company is required to contribute each year generally an amount equal to the lesser of 15% of consolidated income before profit sharing and income taxes or 15% of the total eligible compensation. However, no contribution is required in any year in which the consolidated income described above is less than 8% of consolidated net sales.

The Company has a cash bonus plan for key employees based upon the amount by which consolidated income, before income taxes, exceeds 18% of consolidated shareholders' equity at the close of the preceding year. The aggregate amount payable is computed on a sliding scale of from 7% to 10% of such excess.

5. Long-Term Debt:

Under a Term Loan Agreement with a bank, dated December 31, 1968, the Company bor-

NOTES TO FINANCIAL STATEMENTS

5. Long-Term Debt:

Under a Term Loan Agreement with a bank, dated December 31, 1968, the Company bor-

rowed \$12,000,000 payable in annual installments of \$2,400,000 beginning December 31, 1971. The interest rate on the note (8 $\frac{1}{2}$ % at June 30, 1970) is one-quarter percent per annum greater than the minimum lending rate for short term commercial loans of the bank in effect on the first business day of the calendar quarter. The Agreement contains restrictions regarding the payment of cash dividends and purchase of the Company's stock. As of June 30, 1970, \$9,714,233 of retained earnings was unrestricted for these purposes.

The contract is payable \$454,000 in 1970 and \$500,000 annually thereafter plus interest at 4%. Other long-term debt, with interest of 8% or less, is payable in varying installments which amount to \$136,419 for the year ending June 30, 1971.

6. Common Stock:

On June 16, 1970, the Board of Directors declared a four percent stock dividend payable August 7, 1970 to shareholders of record July 8, 1970; cash payments have been made in lieu of fractional shares.

At June 30, 1970, there were 184,550 shares of the Company's common stock reserved under a qualified stock option plan, and as of that date options to purchase all of the reserved shares were outstanding. The

plan provides that the option price is the fair value (market price) on the date of grant. From the dates of grant, the options are exercisable after two years and expire at the end of five years.

During 1970, options were exercised for the purchase of 4,678 shares for \$69,000 (\$14.75 per share) and the market value on the date exercised was \$107,594 (\$23.00 per share). After giving effect to the four percent stock dividend payable August 7, 1970, there were options outstanding to purchase 191,921 shares for \$3,635,766 (from \$10.35 to \$28.62 per share) of which options to purchase 72,000 shares for \$839,148 (from \$10.35 to \$14.16 per share) were exercisable. No options became initially exercisable during the year.

7. General:

Under a lease expiring in 1987, a subsidiary of the Company is committed to pay an annual rental of \$115,000, aggregating \$1,945,000, plus property taxes, insurance, and certain maintenance costs. The Company also is committed to pay rentals aggregating \$1,000,000 under 53 other leases expiring from 1970 to 1980. For the year ending June 30, 1971, rentals under these 53 leases approximate \$340,000.

ACCOUNTANTS' OPINION

To the Shareholders of Omark Industries, Inc.:

We have examined the consolidated balance sheet of Omark Industries, Inc. and its subsidiaries as of June 30, 1970 and the related statements of consolidated earnings and retained earnings and of source and application of funds for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying statements present fairly the financial position of the companies at June 30, 1970 and the results of their operations and the source and application of their funds for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

See Notes to Financial Statements.

NOTES TO FINANCIAL STATEMENTS

1. Principles of Consolidation:

The consolidated financial statements include the accounts of all domestic and foreign subsidiaries of Omark. All significant intercompany transactions have been eliminated in these statements.

Assets and liabilities of the subsidiaries, other than U.S. and Canadian subsidiaries, included in the consolidated balance sheet at June 30, 1970 are: current assets, \$6,289,379; property—net, \$2,625,201; current liabilities, \$2,647,355; and long-term debt, \$93,780. The Company conducts a substantial portion of its international operations through U.S. (including Puerto Rican—see Note 3) and Canadian subsidiaries. The Company's equity in the net earnings of other than U.S. and Canadian subsidiaries was \$171,000 and \$357,000 for the years ended June 30, 1970 and 1969, respectively.

2. Inventories:

Inventories are valued at the lower of cost (first-in, first-out basis) or market. Major classes of inventory at June 30, 1970 and 1969 were as follows:

| | 1970 | 1969 |
|--------------------|---------------------|---------------------|
| Finished goods .. | \$15,317,351 | \$ 9,416,551 |
| Work in process .. | 9,496,849 | 10,765,263 |
| Raw materials ... | 4,548,921 | 3,500,080 |
| | <u>\$29,363,121</u> | <u>\$23,681,894</u> |

3. Income Taxes:

The statement of consolidated earnings and retained earnings includes the net earnings of a wholly-owned subsidiary operating in Puerto Rico. The manufacturing income is not subject to U.S. income tax and is exempt from Puerto Rican income tax for a ten-year period ending in May 1975. Under certain circumstances an additional ten-year exemption period may be granted. This exemption from Puerto Rican income tax, at an effective rate approximating 35%, reduced the provisions for income taxes by approximately \$1,550,000 and \$1,000,000 for the years ended June 30, 1970 and 1969, respectively. Any dividend paid to the parent by this or certain foreign subsidiaries would be subject to U.S. income taxes. It is anticipated that earnings of these subsidiaries will be rein-

vested in their operations and no dividends are contemplated.

By stipulated decision entered December 16, 1969 by the Tax Court of the United States, income tax deficiencies due from the Company and certain of its subsidiaries for fiscal years ended June 30, 1961, 1962, and 1963 were determined to aggregate \$245,000, compared with asserted tax deficiencies and penalties amounting to \$2,481,802, both amounts exclusive of interest. Now pending are asserted deficiencies and penalties for the years 1964, 1965, and 1966 in the approximate amount of \$5,900,000, exclusive of interest. The Company and its subsidiaries have provided for deferred income taxes in the amount of \$934,000 available for the 1964-66 asserted liabilities. In the opinion of Baker & McKenzie, tax counsel for the Company, this amount is adequate to provide for the liabilities that may ultimately be determined.

The 1970 provision for deferred income taxes consists of a credit of \$1,480,000 for the future tax benefit arising from 1970 tax loss carryforwards of certain subsidiaries and from expenses not currently deductible for tax purposes, less a charge of \$279,000 (\$125,000 in 1969) for the use of accelerated depreciation for income tax purposes.

4. Profit-Sharing and Bonus Plans:

Under provisions of its profit-sharing plan, the Company is required to contribute each year generally an amount equal to the lesser of 15% of consolidated income before profit sharing and income taxes or 15% of the total eligible compensation. However, no contribution is required in any year in which the consolidated income described above is less than 8% of consolidated net sales.

The Company has a cash bonus plan for key employees based upon the amount by which consolidated income, before income taxes, exceeds 18% of consolidated shareholders' equity at the close of the preceding year. The aggregate amount payable is computed on a sliding scale of from 7% to 10% of such excess.

5. Long-Term Debt:

Under a Term Loan Agreement with a bank, dated December 31, 1968, the Company bor-

rowed \$12,000,000 payable in annual installments of \$2,400,000 beginning December 31, 1971. The interest rate on the note (8 1/4% at June 30, 1970) is one-quarter percent per annum greater than the minimum lending rate for short term commercial loans of the bank in effect on the first business day of the calendar quarter. The Agreement contains restrictions regarding the payment of cash dividends and purchase of the Company's stock. As of June 30, 1970, \$9,714,233 of retained earnings was unrestricted for these purposes.

The contract is payable \$454,000 in 1970 and \$500,000 annually thereafter plus interest at 4%. Other long-term debt, with interest of 8% or less, is payable in varying installments which amount to \$136,419 for the year ending June 30, 1971.

6. Common Stock:

On June 16, 1970, the Board of Directors declared a four percent stock dividend payable August 7, 1970 to shareholders of record July 8, 1970; cash payments have been made in lieu of fractional shares.

At June 30, 1970, there were 184,550 shares of the Company's common stock reserved under a qualified stock option plan, and as of that date options to purchase all of the reserved shares were outstanding. The

plan provides that the option price is the fair value (market price) on the date of grant. From the dates of grant, the options are exercisable after two years and expire at the end of five years.

During 1970, options were exercised for the purchase of 4,678 shares for \$69,000 (\$14.75 per share) and the market value on the date exercised was \$107,594 (\$23.00 per share). After giving effect to the four percent stock dividend payable August 7, 1970, there were options outstanding to purchase 191,921 shares for \$3,635,766 (from \$10.35 to \$28.62 per share) of which options to purchase 72,000 shares for \$839,148 (from \$10.35 to \$14.16 per share) were exercisable. No options became initially exercisable during the year.

7. General:

Under a lease expiring in 1987, a subsidiary of the Company is committed to pay an annual rental of \$115,000, aggregating \$1,945,000, plus property taxes, insurance, and certain maintenance costs. The Company also is committed to pay rentals aggregating \$1,000,000 under 53 other leases expiring from 1970 to 1980. For the year ending June 30, 1971, rentals under these 53 leases approximate \$340,000.

ACCOUNTANTS' OPINION

To the Shareholders of Omark Industries, Inc.:

We have examined the consolidated balance sheet of Omark Industries, Inc. and its subsidiaries as of June 30, 1970 and the related statements of consolidated earnings and retained earnings and of source and application of funds for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the accompanying statements present fairly the financial position of the companies at June 30, 1970 and the results of their operations and the source and application of their funds for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

OMARK INDUSTRIES ANNUAL REPORT JUNE 30, 1970

TO OUR SHAREHOLDERS

The fiscal year ended June 30, 1970 was the company's second best in terms of after tax earnings in our 23-year history and it was a record year for sales.

Sales were \$90,078,199 and net earnings were \$5,965,713, or \$1.43 a share, compared to fiscal 1969 sales of \$79,444,171 and record net earnings of \$6,863,529, or \$1.65 a share. Per share earnings figures were adjusted for both years to reflect our sixth annual stock dividend, paid Aug. 7, 1970.

There were a number of reasons for the disappointing lag in earnings. Some of the major industries served by Omark were in a depressed state most of the year and this, in turn, affected the company. The lengthy teamsters' strike also had an adverse effect on several of our operations.

Much more serious, however, were problems in the Williams Air Controls Division and the Winslow Aerospace Tool Subsidiary. Poor performances by both operations cut heavily into our 1970 profits. At Williams, costs of warranty repairs on a product Omark inherited when it acquired this business continued to be high. Additionally, at the end of the year, contingency reserves were accrued for estimated warranty expenses in future years. Inventory adjustments also had a substantially unfavorable effect. Winslow's difficulties were primarily the result of a large cost overrun in the development of a highly sophisticated machine for the aircraft industry. The estimated cost overrun has been charged against 1969-70 and should not be a significant drain in the current year.

Helping to offset these adverse factors was an increase in sales of cutting chain, our highest-volume line. The improving trend in sales and profits of construction tools, noted in last

year's annual report, continued at an even greater rate in 1970, despite depressed conditions in building.

Recent events have focused attention on the balance sheets and liquidity positions of many companies. We feel that strength in the balance sheet is fundamental to good business management and should always be given the importance due it.

We note, in this respect, that, as of June 30, 1970, Omark's net working capital was \$28,240,538 and the current ratio was 2.2 to 1. During fiscal 1970, Omark's total assets in-

creased from \$73,666,635 to \$84,101,313. Shareholders' equity rose from \$40,044,440 to \$45,171,455, after a deduction for the purchase of 50,000 shares of the company's stock for the treasury at a cost of \$850,892. The company's total borrowings did increase from \$19,928,920 to \$26,588,235, primarily to support higher working capital requirements for accounts receivable and inven-

tories. This additional debt and higher interest rates increased interest expense by \$606,748 over 1969.

On August 6, 1970, the Board elected a ninth director, Dr. J. Knight Allen. Dr. Allen has had a distinguished career in finance, education and business consulting. He brings added strength to a Board that already includes members who have many talents.

This year, we have a somewhat different annual report format than in the past. We believe a description of the markets Omark serves and their importance to the company is useful information to our shareholders. We have estimated the percentages of Omark's total business in each of its primary market areas. We hope this information will be helpful to you.

CORPORATE CAPABILITIES

Omark's eight divisions, in order to best serve their many customers throughout the world, require support in a number of areas that can be provided most effectively by the company's corporate organization. These areas are financial resource management, legal and patent counsel, EDP systems and operations, industrial relations, forward planning, public relations and stockholder relations. Omark's corporate management is organized so as to give such support promptly to the divisions in their day-to-day operations. This assistance is available from operating teams that may act either in an advisory or control capacity, from individual officers or from established departments.

The eight-member Corporate Operations Council meets periodically to review divisional programs and budgets so that early remedies may be applied to any developing trouble areas. The Council comprises the President, the two group vice presidents, vice president-finance, general counsel, directors of corporate development and industrial relations and, as ex-officio member, the Chairman of the Board. The Council, primarily a policy-forming and advisory group, has no decision-making authority; the decision is made by the responsible officer.

While the Corporate Operations Council concerns itself with the current operations of the company, the Strategic Planning Council deals with growth objectives and the screening and selection of growth opportunities. Its members are the Chairman, President, group vice presidents, director of corporate development and vice president-finance. The director of corporate development and his staff constantly seek out and study opportunities for corporate growth that may come through product development or acquisition. They work closely with the operating divisions.

An example of how well the divisions employ the capabilities of corporate manage-

ment is the average 2,000 computer reports completed each month for the divisions by the EDP Systems and Operations Department. The department, whose computers handle many routine as well as non-routine tasks, developed the "Touch-Tone" system of inventory control, which uses teletype, telephone and computer in an operation that saves the company over \$25,000 a year.

The corporate level provides both guidance and control in the area of finance. All tax and insurance administration, cash management and budget guidance comes from corporate, which also supplies general legal counsel and patent counsel to the divisions.

Important to both the short-term and long-term needs of the company is the role the Industrial Relations Department plays in management development. It is responsible for administering all training and development programs in line with Omark's planned growth needs. It also recommends and implements broad policies and programs of employment, labor relations, manpower planning, administration of compensation and benefits and other related areas.

The diverse backgrounds of corporate managers and their staffs make the group especially well-equipped to support divisional requirements in many areas. These backgrounds include broad experience in marketing, finance, manufacturing, engineering, foreign trade, planning, tax and patent law, personnel, and communications. Several corporate managers have held positions in divisions and this enables them to be acutely aware of needs and to understand situations at the division level. Of the 38 corporate officers, managers and staff members, more than one-third hold advanced academic degrees.

These resources of corporate management give Omark the capabilities necessary to make the most of the earning power of its combined divisions and to meet the overall growth goals of the company.

FORESTS

The forest industries—pulpwood and timber production—represent Omark's largest market, accounting for approximately 30 per cent of the company's sales. Of the two market segments, pulpwood is much the more important one to Omark.

Two of the company's divisions serve the forest industries: The OREGON Saw Chain Division and the Hydraulic Materials Handling Division.

The chain division is the world's largest producer of cutting chain for power saws. OREGON-manufactured chain is original equipment on saws made by most of the several dozen U. S. saw manufacturers, including such leaders as Homelite, McCulloch and Beaird-Poulan. Fifteen major foreign saw manufacturers also place Omark's chain on their saws. Replacement saw chain is marketed through a worldwide system of more than 30,000 outlets. Almost half of the chain produced by Omark is sold outside the United States. The division also produces the bars around which the chain travels, drive sprockets for saws and other accessories.

The Hydraulic Materials Handling Division manufactures several types of hydraulic logging loaders under the Prentice brand name. Other capital equipment produced by the division for the forest industries includes the Prentice Saw-Buck, a single-operator, remotely controlled saw mounted on a portable steel crib.

As is the case with most Omark products, the equipment it sells to the forest industries embodies many time- and labor-saving fea-

tures. This fills a pressing need, for as wage rates in the forests continue to increase sharply and rapidly while the labor supply decreases, more and more pulpwood and timber producing operations are finding that complete mechanization often makes the difference between profit and loss.

About 70 per cent of sales by the materials handling division is accounted for by the forest industries. More than half of the company's cutting chain is used in the commercial harvesting of trees. Most of the remainder is sold to agricultural, commercial and leisure-recreation markets.

Cutting chain sales in fiscal 1970 exceeded those of the previous year, despite the unfavorable impact of the prolonged teamsters' strike and growing competitive pressures.

Chain products were especially strong in Latin America, Europe, Japan and the U. S. A key factor in U. S. sales growth in the fourth quarter was a promotional program offering dealers extended terms. As last year progressed, the mix of chain sales shifted to the more profitable replacement market and there was improvement also in product mix. New supply contracts were signed with three major saw manufacturers.

Super Chisel, a strong, high-performance cutting chain was introduced during the year and found an enthusiastic acceptance in world markets. At year's end, the division was substantially back-ordered on this type. In March, the division introduced a chain not bearing the OREGON label that can compete in the lower-price field, a market segment that is new to the division. Also soon to be

Pulpwood harvesting is made easier with a Prentice Saw-Buck (top left) and a hydraulic loader (top right). The combination allows one man to cut pulpwood to required lengths and stack it on a truck for rapid transport to the mill. Chain saw (bottom photo) is the basic tool of the pulpwood industry. On opposite page, chain saw components are shown.

FORESTS

offered are an additional chain type designed more for the professional woodcutter and a new chain bar that has a sprocket in its tip.

Although the division is confident of achieving its budget for this quarter, the first in the new fiscal year, it does expect some weakening in the U.S. chain market. Near the end of the quarter the expansion of the Puerto Rican plant will be completed. The added 23,000 square feet, doubling the size of the plant, will provide this extremely profitable facility with a significant increase in its production capacity.

Strong competitive pressures are expected to continue throughout the year. However,

the division's new products, the upgrading of three major products, new packaging and scheduled promotions should ease these pressures considerably.

The past year saw an interruption in the growth of the Hydraulic Materials Handling Division. In the three years since this division was acquired by Omark, it has grown to a two-plant operation, acquired two additional product lines, increased sales more than 65 per cent and established an organization structure capable of sustaining division growth.

With this kind of record, the division's poor performance for the year was especially dis-

Prentice Series 600 loader hoists a tree effortlessly in a Pacific Northwest timber-harvesting operation. On opposite page, an Indian deep in the Brazilian jungle fells a tree with saw equipped with Omark's OREGON chain.

appointing. Sales were slightly above a year ago, due almost altogether to a price increase. Profits declined sharply from the previous year's level.

There were a number of reasons for this interruption in the division's growth. A primary one was the very depressed residential construction market throughout the year. This cut sharply into sales of capital equipment used in the timber and lumber industry and also slowed sales to the division's other major market, the construction industry.

Near the end of the fiscal year, pulpwood production, which represents about 50 per cent of the division's entire market, began to decline.

Profits also were affected by substantial increases in costs of both materials and labor. Additionally, there were increases in marketing and administrative expenses. The latter were tied directly to startup costs of the new headquarters plant in Zebulon, North Carolina, which required a duplication of management personnel there and in Prentice, Wisconsin, the division's former headquarters.

A customer-oriented promotion and a dealer incentive program are expected to enhance the division's performance during the second and third quarters.

This year's performance also should be favorably affected by several steps that are being taken to keep costs down. These include a major program to improve control in manufacturing and in labor and materials requirements.

The division has weathered a period of instability in its markets with a minimum of dis-

ruption to its organization. It is now in an excellent position to benefit from improvements in the overall economy and the markets it serves.

Omark's major original equipment customers in the forest industries market include:

Homelite Division of Textron, Inc.
McCulloch Corp.
Roper Corp.
American-Lincoln Division of Scott & Fetzer Co.
Beaird-Poulan, Inc.
Stihl American, Inc.
Eaton Yale & Towne, Inc.

AIRCRAFT- AEROSPACE

Omark is a major supplier to the aircraft-aerospace industry of fasteners, drilling and cutting tools that make the holes for the fasteners and equipment for sharpening and pointing these tools.

Today's high-performance aircraft would not be possible without lightweight and high-strength fasteners that can withstand tremendous stresses and sudden changes in temperature extremes. Some of these fasteners for critical structural components must have a minimum strength of 300,000 pounds per square inch and must be made to extremely close tolerances. To meet such exacting demands requires exceptional capabilities in metallurgical testing and manufacturing.

Precision drilling and countersinking tools are used to make holes measured in the millionths of an inch into which the fasteners must be properly fitted. This, too, requires unique capabilities. The machinery used to sharpen and joint these tools also must be designed and manufactured to meet exacting performance standards.

The principal product line of the Precision Fastening Subsidiary is the proprietary Taper-Lok system. Taper-Lok is an integrated fastening system comprising a tapered fastener installed in a precision-tapered hole with a matching washernut or swage collar. The system is licensed to three other manufacturers.

Other proprietary products of the subsidiary are tooling used to install Taper-Lok; Temp-Lok, a fastening system designed for extremely high and low temperature applications, and a strong, lightweight washer and nut assembly.

The Winslow Aerospace Tool Subsidiary

designs, builds and markets high-precision drilling and countersinking, automatic riveting, drill-pointing and specialized grinding tools and equipment for the aircraft industry. Some of the hydraulic and pneumatic tooling is used to make the holes and install the fasteners produced by the Precision Fastening Subsidiary.

The aircraft-aerospace market accounted for about 22 per cent of Omark's total sales in fiscal 1970. Over 80 per cent of that volume was generated by the Precision Fastening Subsidiary, which sells only in this market. It was the market for approximately 60 per cent of Winslow's products.

Omark's sales to the industry were above those of the previous year, but softened significantly in the fourth quarter because of the depressed condition of the aircraft-aerospace industry. For Omark, at least, the effects of this softness are not expected

to extend beyond the second half of the current fiscal year. Major customers of the Precision Fastening Subsidiary have been supplying themselves to a considerable extent from accumulated inventories during the stretch-out. They continue, however, to build aircraft and it is anticipated that, late in calendar 1970, they will resume ordering at a more normal rate.

A heavy drain on profits was caused by development expenses of an advanced-type grinding system for tools and, particularly, a large cost overrun in developing and building what is probably the world's largest automatic drill riveter. This machine will handle riveting operations on fuselage and wing sections of the Navy's F-14 supersonic fighter. It was due to be delivered in June 1970, but probably

The Precision Fastening Subsidiary will provide thousands of high-strength titanium Taper-Lok fasteners for the new McDonnell Douglas DC-10 airliner, shown under construction in top photo. The fasteners increase aircraft fatigue life. The subsidiary makes a wide range of precision tapered fasteners (below left and opposite page). Cutting drills (bottom right) made by the Winslow Aerospace Tool Subsidiary, are used by many U. S. aircraft builders. Winslow also makes the pneumatic and hydraulic tools that drive the drills.

AIRCRAFT-AEROSPACE

will not be shipped until the second quarter of the current year. This year's profits should be only minimally affected by pressures from this project.

A vigorous new management team at the Winslow subsidiary has reduced fixed expenses, increased efficiency, shortened delivery time and has put to work new practices in administration, engineering and manufacturing.

The ability to adjust quickly to customer needs has become increasingly important in serving the aircraft-aerospace market. A new fully integrated engineering model shop at the Precision Fastening Subsidiary, which began operating last year, gives Omark this capability. With this new quick-response engineering capacity, the subsidiary can solve most unanticipated application problems on as short a notice as 48 hours.

Three new fasteners that meet an existing need will be introduced to the market this year and a fourth is under development. The Winslow subsidiary's new hydraulic tools, recently introduced, make it possible to drill larger holes in harder and thicker material than was possible with pneumatic power. This fills an important need of the new generation of super-size aircraft.

The two subsidiaries are working closely together as a team where joint efforts promise to enhance the goals of one or the other, or both. For instance, taking a systems approach, they meet with customers to hold joint demonstrations of drillmotors, cutters and fasteners. Engineering information is exchanged, and mutual inspection procedures have been put into effect where feasible. A joint venture, now in progress in Europe, includes appointment of the first European distributor by the Precision Fastening Subsidiary.

Omark's sales to the aircraft-aerospace industry are expected to continue in the doldrums through calendar 1970, but it is anticipated they will show a steady increase in the first six months of 1971.

The company's major customers in this industry are:

McDonnell Douglas Corp.
Lockheed Aircraft Corp.
General Dynamics Corp.
Grumman Aircraft Engineering Corp.
The Boeing Co.
North American Rockwell Corp.
Avco Corp.
Northrop Corp.

CONSTRUCTION

Omark serves all three major segments of the construction industry: nonresidential building, residential building and nonbuilding construction. Approximately 16 per cent of the company's sales are to the industry, which is an important market of three Omark divisions and a lesser market for a fourth division.

About 90 per cent of the Construction Tools Division's volume is accounted for by the equipment, tools and fasteners it supplies the construction industry.

Omark's construction tool system comprises a fastening tool that, with a powder load, drives metal fasteners of many sizes and configurations into concrete or steel. The company manufactures all three elements of the system — tool, powder load and fastener.

Diamond-segmented blades and core drills produced by the division are used to cut and drill into concrete or masonry. Welders that use metal pins to fasten insulation are made by the KSM Welding Systems Division and marketed by the Construction Tools Division. All products from this division are used primarily in construction other than homebuilding.

In terms of budgeted results and improvement over the previous year, the Construction Tools Division was Omark's best performer in fiscal 1970. A new approach to marketing was the major reason for the divi-

sion's outstanding success during the year. The new approach is now being expanded.

During fiscal 1971, the division will introduce several new fasteners and pins in the U. S. market and a tool embodying a new fastening concept. By the end of the current fiscal year, development will be completed on a new type of fastening system that can greatly reduce labor costs at one stage of construction. The division soon will begin construction in Portland of a plant to manufacture fasteners. The Adelaide, Australia plant, where powder-actuated tools are produced, also is being expanded.

Sales by the KSM Welding Systems Division to the construction industry in 1970 increased 11 per cent over 1969, while overall division sales rose by 10 per cent. Construction is the largest single market for the automatic welders and welded stud fasteners produced by the

division, which has customers in more than 70 other industries.

Cycles in the rate of construction of one- and two-family dwellings do not affect the sales of this division. Its equipment is used in constructing commercial, industrial and government buildings and in building bridges and highways.

A number of reasons are responsible for KSM's continued growth in construction. A significant one is the labor-saving features

Diamond-edged core drills (above) cut through concrete and masonry and come in several sizes.

CONSTRUCTION

stud welding offers an industry that has been hard-pressed by spiraling labor costs. Another is the division's recent penetration of market areas in this industry that were not previously served by KSM to any material extent. The increased use of pre-stressed concrete construction, which has provided new welding applications, also helped last year's growth, and products developed in previous years specifically for construction began to find increasing usage during the year.

The division expects to continue in the current year its growth in sales to the construction industry. It should benefit from the increase in nonresidential building that is forecast by the F. W. Dodge market outlook. Expanding Federal Government programs, especially including aid for hospital construction, can be expected to be another positive factor.

Considering the longer-term outlook, about 40 per cent of the 41,000-mile interstate highway network is yet to be completed, and KSM will continue to share in this market.

The construction industry is the second largest market for sales of hydraulic materials handling equipment, accounting in fiscal 1970 for more than 20 per cent of this division's volume. The construction line consists of telescopic cranes and folding booms, block unloaders, and loaders for handling stacked materials such as gypsum board, plywood and roofing. The line is marketed under the Prentice name.

The Hydraulic Materials Handling Division's sales to the construction industry were unfavorably influenced by the greatly diminished activity in residential building throughout the year. The division is considerably more dependent on this segment of the industry than are the other Omark operations tied to construction.

Another factor working against the division's performance was the time required to transfer production of the former Alenco line

of cranes from Texas to the new North Carolina plant. During this transition, lead time on crane orders stretched to a point that caused loss of sales. The problem is past, however, and the division now is in position to meet the demand for this equipment.

During the first half of the present fiscal year, the division will introduce three products to serve the construction industry which will be compatible with equipment now produced by the division and marketed by its dealers. Each of the three will make possible reduced labor costs of materials handling at the construction site.

The fourth Omark operation selling to the construction industry is the Sporting Equipment Division. About 10 per cent of its sales last year was to this market and consisted of loads for powder-actuated tools to customers other than the Construction Tools Division, which it also supplies.

Omark serves the nation's construction industry with many time- and labor-saving products. Metal construction fasteners (opposite page) come in many shapes and sizes. More than 1 million Omark stud welded shear connectors that tie concrete to steel will be in the twin towers of New York's World Trade Center when completed (above, left). A shear connector (top right) is welded to the decking of the new headquarters building of the West Coast Transmission Co., Ltd., Vancouver, British Columbia. Omark telescopic crane (below right) raises precast concrete wall panel into place quickly and accurately.

LEISURE- RECREATION

The leisure-recreation market accounts for approximately 11 per cent of Omark's total sales volume. For two of the company's divisions, it is a very important market. It accounts for sales of less than \$1 million by a third division.

About 21 per cent of the OREGON Saw Chain Division's sales are made directly, or through saw manufacturers, indirectly, to leisure-time users of chain saws. Two-thirds of chain saw owners are occasional users not employed in the forest industries. There is a chain saw in one out of every 19 American households. Homeowners use them to cut fireplace wood, make fence posts and to trim trees and large shrubs. A great many of these users are campers and hunters who take along their saws at vacation time to cut firewood and clear campsites in remote areas, or to dress large game such as moose or elk.

Homeowner use of chain saws is also growing in Canada. It is not, however, a significant market factor outside North America.

The Sporting Equipment Division's dollar sales to the leisure-recreation market amount to about half that of the saw chain division, but this market accounts for about 90 per cent of the division's total business. The division produces small arms ammunition and ammunition primers for sportsmen who prefer to assemble or reload their own ammunition. The products are marketed under the CCI brand name.

The division's sales and profits in fiscal 1970 were below those of the previous year. Several of the reasons for this performance lag stems from restrictions of Federal gun control legislation and the difficulties in administering this law. A large segment of the

youth market was lost because of restrictions the law places on ammunition purchases by youths. Many of the smaller volume dealers abandoned the business because of the paperwork required. Aside from the legislation, high inventories and tight money caused some dealers to reduce buying. Additionally, the division's results were affected by higher costs of brass and lead and increased labor costs.

The brightest aspect of the past year was the spectacular reception given to the division's new 100-Pak Plastic .22 ammunition dispenser-package by shooting enthusiasts. Heavy demand for the 100-Pak required a three-shift schedule for several months in some operations at the division's Lewiston, Idaho plant.

The recent installation of modern new equipment at Lewiston is expected to increase production capacity while reducing costs. The division anticipates an increase in sales in the current year of about 30 per cent over those of fiscal 1970.

Small caliber rifles comprise less than 10 per cent of sales by the Construction Tools Division. They are manufactured in the division's Adelaide, Australia plant, which also produces powder-actuated construction tools. The rifles, marketed primarily in the British Commonwealth nations, are not at present available in the U. S.

So long as leisure time for the working American continues while his disposable income also rises, this market can be expected to continue to grow at a rapid pace. Recognizing this, Omark is currently looking for promising acquisition opportunities in this area.

The leisure time becoming increasingly available to Americans provides Omark with significant marketing opportunities. The Sporting Equipment Division's 100-Pak .22 rimfire ammunition dispenser (top) has been enthusiastically received by sportsmen. Chain saws (below) have become an indispensable tool for many homeowners who use them for chores around the house, for camping and for gathering firewood.

OTHER MARKET AREAS

Approximately 20 per cent of Omark's total sales are to a wide range of industries. These industries provide markets in varying degrees of importance to five of the company's eight divisions. They include many general manufacturing companies, most of which are engaged in metal fabrication; utilities, electronics, transportation and agriculture. Also, Omark sales are made to enterprises in several service categories, and to state and municipal governments.

The Williams Air Controls Division, which accounts for less than 5 per cent of Omark's total dollar volume, primarily serves the truck manufacturing and health service industries. It produces air valving systems, air brake controls, compression brakes and stoplight switches for heavy trucks. Some of this equipment is also used on other large vehicles, such as earth-moving equipment.

The division's Encore Operations is a leading supplier of portable and mobile dental office equipment, including high-speed, air-driven dental drills. Of the two lines, automotive products return the most dollars.

Due to a combination of factors, the Williams division in fiscal 1970 incurred losses substantial enough to significantly affect Omark's earnings for the year. A major problem throughout the year was warranty

costs of a dental drill that had been introduced to the market before Omark acquired this business in 1968. These repairs have been quite costly to the company. Although warranties on some of the drills will be in effect for as long as four more years, their cost should have little if any impact on future year's earnings, since anticipated expenses of the remaining warranties were provided for in fiscal 1970.

Other problems besetting the Williams division were both internal and external. The very sharp downturn in truck manufacturing hurt sales. General economic conditions also had their effect on sales of the dental line. Significant year-end adjustments added to these pressures.

As fiscal 1971 began there were some indications of a moderate improvement in demand for the division's products. Plans for more aggressive mar-

keting, more competitive pricing and new product introductions help to brighten the outlook for the current year.

The Winslow Aerospace Tool Subsidiary's specialized grinding tools for metalworking find their best market, aside from the aircraft industry, among manufacturers of twist drills and other cutting tools. These Winslow machine tools also are sold to the automotive industry, farm machinery manufacturers, ap-

Stud welders from the KSM Welding Systems Division continue to find new applications in shipbuilding, metal fabricating and general engineering. Welding a terminal housing (top) is done with the aid of a position jig. Stud welding is much faster than the old method of drilling and tapping holes. The use of air controls, air brake systems, valves and gauges in heavy-duty trucks (below) keeps Williams Air Controls Division engineers busy designing new products to meet the needs of the expanding road transport industry. Winslow's Exactamatic drill pointer (opposite page), widely used in many industries, sells for \$4,500.

OTHER MARKET AREAS

pliance producers, manufacturers of road-building equipment and a variety of metal fabricating businesses.

Machine tool sales in fiscal 1970 were below those of the previous year. However, near the end of the year foreign sales began showing renewed strength and were ahead of budgeted sales in the early weeks of the current year. Domestic sales also began developing new vigor as the 1970-71 year began.

The KSM Welding Systems Division has customers in more than 70 industries. The largest volume from sales of welders and welded fasteners, other than the construction industry, is accounted for by general manufacturing in the metal fabricating area. This includes producers of office equipment, stainless steel furniture and fixtures, materials handling equipment, and forging operations. Other industries providing markets for KSM products include shipbuilding, railroad, automotive, electronics, appliance, electric utility and electrical equipment.

A low-cost, low-maintenance welding system consisting of a lightweight, automatically fed hand welder, a stud feed supply and a power source, introduced in the past fiscal year, received an excellent reception in domestic and overseas automotive markets. KSM supplied the studs for the first section

of the Mersey Tunnel project in Great Britain and has the order for studs to be used in completing the second section.

The division's customers include the U.S. Navy, the Ingalls Shipyards of Litton Industries, Inc., the Avondale Shipyards subsidiary of Ogden Corp., Babcock & Wilcox Co., McGraw-Edison Co. and American Machine & Foundry Co.

Cutting chain sales outside the forest industries and the leisure-recreation market amounted to an estimated 6 per cent of the company's total volume in fiscal 1970. Most of these were to farmers, tree surgeons, nurserymen, municipalities and utilities.

Colform, an operation of the OREGON Saw Chain Division, is a contract manufacturer to other companies of small, high-precision metal parts made in large volume by cold forming processes.

About 6 per cent of the Hydraulic Materials Handling Division's sales were to a broad range of industries and service businesses. Hydraulically operated Prentice cranes and booms are used by railroads, utilities, refineries, municipalities, engine rebuilders, airports, metal fabricators and pipeline companies. They are also used to handle monuments, burial vaults, tires, large trash bins and, with a bucket attachment, such bulk materials as lime, sand, gravel, sulfur and rock salt.

SOCIAL RESPONSIBILITY

In the fermenting world of the seventies, it is not enough for business merely to accept its responsibilities to society. Business and industry must be leaders in the struggle for a more liveable world for all. Omark is committed by policy to this principle.

Early in its history, the company determined that its plants and buildings would be constructed so as to enhance, rather than detract from, their surroundings. Two of its plants have won national awards for combining beauty with utility. The manufacturing processes in these plants do not produce significant amounts of pollutants that dirty air, water or soil. The relatively small amounts of acids used are neutralized before disposal. There is no dirty smoke from manufacturing; solid

wastes are not burned. Gardeners are prohibited from using dangerous chemicals in the maintenance of the carefully landscaped grounds around Omark buildings.

Omark is an equal opportunity employer, not just in theory, but in reality. It has been an enthusiastic participant in the JOBS program of the National Alliance of Businessmen. Minority group members at Omark hold jobs at most levels from laborer to manager. Seventeen per cent of the company's skilled craftsmen are members of minority groups. In efforts to assume a greater responsibility in this area, Omark from time to time operates training programs for non-whites and it actively seeks them in recruiting efforts. The company also maintains deposits in Port-

The Portland plant of the OREGON Saw Chain Division is typical of Omark's manufacturing facilities. Its clean architectural lines enhance carefully landscaped surroundings. The plant, named one of the 10 best in the U. S. by *Factory magazine*, produces no pollutants to dirty the air.

SOCIAL RESPONSIBILITY

land's only black-operated bank, whose volunteer advisory board includes Omark's vice president-finance. And Omark is a substantial contributor to worthy projects in areas where the disadvantaged live.

Significant financial support also is given to colleges, art associations, orchestras, theatre groups, ballet associations and museums as well as to the community welfare organizations that are regularly supported by most businesses.

Omark actively encourages its employees to participate in activities aimed at improving the community and the quality of life, and many employees have responded with gen-

erous donations of time and talent. They are city councilmen, school and college board members, planning commissioners, scouting officials, park commissioners and UGN officials. Others are active leaders in groups concerned with environmental quality, such as the Sierra Club and the Izaak Walton League.

Omark will continue to meet its responsibilities to society generally and, specifically, to the communities in which it operates. The duty is obvious and good business demands it, for company conscience can enhance the balance sheet as well as help make communities a better place to live.

On a sunny day, Omark production employees enjoy their lunch hour on a patio designed for that purpose. Pleasant job surroundings are among the many free fringe benefits the company offers.

BOARD OF DIRECTORS

Each member of Omark's Board of Directors was chosen because of the distinct contribution he and his experience could bring to the operations of the company. Consequently, it is a well-balanced Board whose members have backgrounds in several disciplines. These include business management, marketing, finance, economics, science, engineering, law, education and manufacturing.

John D. Gray, Chairman of the Board and Chief Executive Officer, joined the company that later was to become Omark Industries, Inc. in 1948 as assistant general manager. In 1953, Mr. Gray became its president and principal owner. In 1967, he was elected Chairman and Chief Executive Officer.

Edward P. Skralakis, President of Omark, came to the company in 1954 as assistant to the president. He subsequently became general manager, executive vice president and, in 1967, President, succeeding Mr. Gray, who had held the dual positions of Chairman and President.

Dr. J. Knight Allen is management consultant to the Bechtel Corp. He formerly was senior staff specialist and director of corporate strategy research at Stanford Research Institute.

Dr. Robert T. Davis, professor of marketing at Stanford University, is the author of three books and numerous articles on marketing. He has also been on the faculties of Dart-

mouth, Harvard and St. Lawrence Universities and for two years was vice president, marketing, of Varian Associates.

Frank K. Kelemen has a background as engineer, inventor, publisher and industrialist. He founded KSM Products, Inc. in 1946 and was its president until 1966 when KSM was merged with Omark.

Dr. Wayne E. Kuhn, former general manager of research and technical development at Texaco, Inc., has been chairman or president of several professional chemical societies. He received the 1970 Honor Award of the Commercial Chemical Development Association.

David S. Pattullo is a partner in the law firm of Pattullo, Gleason & Hinson in Portland and a senior member of the firm of Pattullo, Gleason & O'Neill, Certified Public Accountants. He has been a lecturer on taxation for many years.

Ross B. Thompson, financial vice president and treasurer of Reed College, was treasurer of Litton Industries, Inc. from 1958 to 1966. Mr. Thompson is a Certified Public Accountant.

G. J. Ticoulat is a retired president of Crown Zellerbach International with strong marketing experience. He has held several U. S. Government posts and has been an officer or board member of many trade and civic organizations.

May 26, 1971

S. Lynn Sutcliffe, Esq.
Staff Counsel Committee on Commerce
United States Senate
Washington, D. C. 20510

Dear Mr. Sutcliffe:

As requested in your letter of May 21st and discussed with you personally on May 26th, attached are a number of papers covering our activities and testimony here in Pennsylvania.

The items referring directly to automobile insurance we would like to have inserted in the record. The items on Blue Cross and medical insurance we would also like inserted in the record, if there is no objection since medical insurance is an integral part of automobile insurance costs.

We have testified at every Penna. hearing on all kinds of insurance -- in fact, we think we are the only organization which can make that statement.

We are preparing a letter to all Congressmen specifically asking for rejection of Senate Bill S-947 and giving our specific reasons why. As soon as this is ready for delivery (which we expect to do in person rather than mail them out) we will see that you receive a copy.

Sincerely yours,

CITIZENS COMMITTEE FOR ETHICAL INSURANCE

1/s

Frank K. Jones
President

P.S. - Will you be kind enough to let us have two copies of the record showing the portion of the record where this is recorded. We would like a complete copy of the record, if possible. When I personally testified before the Senate and House on income tax matters, they sent me a complete set of each.

IF YOU WILL SPEND ONE HALF HOUR A YEAR HELPING YOUR CAUSE, YOUR MEMBERSHIP IS SOLICITED.

CITIZENS COMMITTEE FOR ETHICAL INSURANCE
560 Woodside Rd., Berwyn, Pa. 19318
Frank K. Jones, President

Testimony Harrisburg, Pa. Wednesday May 5, 1971 - \$100 Deductibles; Auto and other insurance, before Insurance Commission Herbert Denenberg.

We are alarmed at the present tendency to eliminate liability from the insurance industry without simultaneous specific required rate reductions tied to the package.

We note with alarm that Commissioner Denenberg testified in Washington that National control of insurance should not occur (This is another of the things the industry wants) He wants Congress to set National Standards and depend on State governments to enforce them.

We recommend National licensing of companies, establishment of National Standards and State administration. Our program outlines the method and we are working in Washington to that end.

We believe the most important thing to be done in the insurance reform is to have immediate, total, strict controls over advertising. Ridiculous advertising was the tool used to bring about the present chaotic insurance problem. We have repeatedly raised that point, most recently at the Blue Cross hearings in Phila. where we placed specimen advertisements on the record.

We present to the Department today a full page ad appearing in the Daily Local News, West Chester, Pa. on April 19, 1971 which National Home Life Assurance Co. gives the public three days to accept. The offering of "Free Cash" is alluring.

Not to be outdone, the Life Assurance Company of Pennsylvania, in the same paper on May 3, 1971, gives the public three days to accept a plan that "pays twice."

On T.V. we saw another advertisement of a company which proclaimed that it paid so liberally, that you got reimbursement and had "enough cash left over for a party".

In the February 26th release of the Insurance Department in regard to the present hearing, it speaks out against the "trading of dollars" for small claims, in almost every kind of insurance. We see nothing which indicates that elimination of small claims will

- a - keep the deductibles from expanding in the future to higher limits while the rates, at best, remain the same. They will probably be higher.
- b - require the dumping of excess service costs (mentioned by the Commissioner). That excess will probably be transferred to other operations and cause a continuing "unprofitable business" on the now profitable remaining part, and foster requests for still higher premiums.
(here again we state we are not looking at of now with the "fat on the fire" We are looking at what things will be like twenty years or more from now when the public has been lulled and the industry takes over again under another Insurance Commissioner.)
- c - eliminating small claims, especially in automobile, will take all incentive from the companies to join in the fight for safer cars which are also less expensive to repair and for safer highways etc. etc. The \$100 will hardly cover the same, or more, useless "trim" and collapsible fenders and useless bumpers, and fancy headlights, and tender windshields before you get into the serious business and repairing the OPERATING PARTS of the cars.
- d - The net cost to an insurance company for replacing a windshield is about \$100. The net cost to an owner is \$140.00. That \$140 and all other "deductibles" from other claims will be another premium charge so far as the policyholder is concerned. We think such out-of-pocket expenditures should be used as a reduction of the Department's "trading dollars" to get a true picture.

- e - We think you will bring on another wave of padded claims from some socially prominent places, let alone the previously accused lower echelon.
- f - Commissioner Reed once said insurance was like membership in a club. We have always contended it was buying the right to support the Insurance Industry welfare fund.

We continue to insist that elimination of HAZARDS rather than elimination of claims and elimination of wasteful operation overheads rather than expanding them, will solve the problem -- arithmetic never will.

It seems to us that the Insurance Industry progressively developed an indefensible and complex insurance program via the "competition" trail and in doing it developed a vast plush "overhead". It is our opinion that this vast overhead will be defended and even expanded in the future unless

- 1 - strictly enforced laws are drawn up specifically outlining the coverages which can be sold
- 2 - specifically stating the NORMAL MINIMUM policy which MUST be sold (and let the companies bid for that policy via competition)
- 3 - specifically stating what additional coverages can be had by "rider" and the "rider" must be self-supporting, including all additional "overhead" created (no more million dollar coverages for "pennies a day" for those in the social register).
- 4 - specifically stating how much overhead can be set up against each coverage.
- 5 - specifically calling for approval of all fullpage newspaper advertising as well as major radio/T.V. and magazine advertising.

We also want the Blue Book valuation of cars in insurance claims eliminated. The Blue Book is an evaluation for trade-in/sales purposes and has no place in the determination of actual value to the owner who keeps a car.

We believe that the advent of no-fault insurance (which also has \$100 deductible) will have adverse effect. For years the insurance industry has been using the deductible on "collision" for getting additional premiums - I can give you specifics on this.

Summing up - we think we must abandon the idea that Arithmetic is insurance and it alone can solve this problem. Make the function and the contents of policies realistic and honorable and the arithmetic will take care of itself. Your main battle is that you are not really fighting insurance losses, you are fighting lucrative jobs of several million people (to use the statistics of the insurance industry) plus the Rating Bureau and "consultants" (actuaries) and expensive lobbies, along with 220 (their figures) associations which "don't even communicate with eachother" (also their statement).

We have frequently been criticized for "straying from the point" in our presentations. The insurance mess is like a bucket of eels, you can't understand one eel without getting entangled in others. We hope you will be aware of every eel as you follow your own course.

MAY 5 1971

FRANK K. JONES
President & Chairman Executive Comm.

PRESS RELEASE

LEGISLATION IS NEEDED

We have frequently requested the Insurance Department over the years to seek legislation so that policyholders will be satisfied as to the amount charged for premiums. We have a continuing request to investigate if the current premiums contain "penalties" for use of the policy in the way of claims, etc. All information we have been able to obtain from whatever source bedclouds the issue and leaves us completely frustrated as to the answers.

To clear this up, EVERY POLICY should be required to show ON ITS FACE —

| | |
|---|----------|
| Approved NORMAL RATE by the Penna. Insurance Department | \$ _____ |
| Surcharge penalty (details enclosed and policyholder has right to appeal to Insurance Department if he does not consider this proper) | \$ _____ |
| TOTAL AMOUNT OF PREMIUM | \$ _____ |

We think that the accumulated figures from the insurance company billings should be shown in this same detail in the official rate filing forecasts etc.

We have long contended that since the companies have this built-in increase which they can capriciously apply, that there is no need for such increases as they ask. We find no provision for "use of policy without penalty" and we have drawn this to the attention of the Insurance Department in our testimony at hearings.

Since "normal rate" increases generally make it impossible for the average person to know what the "current billing normal rate is", we believe he is entitled to know.

Niegore 4-0725
BERRY HEARINGS

548 Woodside Road
Brynar, Pennsylvania

Frank K Jones

CONSULTANT TO SMALL BUSINESS

Testimony before the Penna. Insurance Department, Harrisburg, Pa. 2.P.M. Wednesday, April 7, 1971 — William Penn Museum Bldg., re "Automobile Public Rate Hearings April 5, 6 7 and 8). (see also testimony of Citizens Committee For Ethical Insurance, Bryn. Pa. same date).

Mr. Commissioner:

This statement relates more particularly to the rote filing of NATIONWIDE INSURANCE COMPANY, but insofar as appropriate I wish it to be combined with the dockets of all other companies included in the current series of hearings. In particular I wish it combined with the testimony of the Citizens Committee For Ethical Insurance which I shall also present.

I wish to refresh the record by reminding the Department that Nationwide Insurance Company started me on this insurance battle back in 1964 by improperly cancelling my insurance (I have a letter of apology from them). I subsequently organized the Citizens Committee For Ethical Insurance and we are now incorporated to carry this fight on permanently — eventually as a watchdog group. Our present effort will be mostly in Washington. D.C.

For years I have testified at hearings that it is entirely too easy to obtain the right to operate in Pennsylvania and too easy to maintain that right.

This Company has been in the forefront of disturbing elements in the insurance crisis. Through the Committee I have brought specific proof of its activities in Philadelphia as well as elsewhere in the matter of cancellations of completely innocent policyholders on a mass scale with blatant disregard on their part to the basic purpose of insurance, and the records of the insured, or the peace of the industry. They also initiated this present mass deluge of applications for increases.

I ask that you examine the financial reports of this Company. It now sells other lines of insurance than automobile. You should determine if, as each new line was taken on, the expense factors were properly corrected or whether they remained static.

I ask your consideration as to why this Company should not be denied the right to operate in Pennsylvania, on three grounds:

- 1 - Its cancellation record which is highly irresponsible.
- 2 - I have personally called over fifty of their outlets and not a single one of them indicated they are doing anything about hazard elimination or knew of anyone in the company who was, or if the company, in fact, had any program.
- 3 - The increase is not required for the other reasons which are being noted on the record by the Citizens Committee For Ethical Insurance, of Bryn. Pa.

EXECUTIVE COMMITTEE

580 WOODSIDE ROAD
BERWYN, PENNSYLVANIA

We have never charged anyone
who has come to us for help -
and we have helped many

FRANK K. JONES
President & Chairman Executive Comm.

Testimony before the Penna. Insurance Department, Harrisburg, Pa. 2 P.M. Wednesday,
April 7, 1971 - William Penn Museum Bldg., re "Public Automobile Rate Hearings"
April 5, 6, 7 and 8 - (See also testimony of Frank K. Jones, Citizen, same date)

Mr. Commissioner:

We are not entering our customary testimony in depth because we now believe that only total Federal Insurance can possibly solve the insurance requirements of the people.

We ask that any increases you may authorize following these hearings be limited to one year and that they automatically revert to present rates at that time.

We have always contended that it is too easy to obtain right to operate in Penna. and too easy to maintain that right. We ask that the testimony of Frank K. Jones, citizen, be considered in conjunction with our own.

We have always asked that increases be denied until companies did things to eliminate hazards -- not just talk about them. On Oct. 2, 1970 they set up the Penna. Action Committee on Highway Safety (you, Mr. Commissioner, are Chairman of that Committee). We have paid for a series of reports and recommendations but see nothing of hazard elimination. Our Committee, for its part, since Oct. 2nd, has arranged for a school bus unloading off street at one spot -- we had the confusing traffic lights on Market Street corrected (when PACHS was not interested when we told them about it) -- we are working on the traffic lights on Walnut Street, Phila. -- we have gotten numerous trees and bushes trimmed and potholes plugged -- we produced a motion picture on highway hazards (we have it here to show you if you wish) -- that is what we mean by A C T I O N. The industry is FIRST to know about accident clusters and contributing faults -- they can avoid claims and not need increases -- by ACTION.

Deny these increases as an incentive to all companies, so they will

- 1 - Actively work on hazard elimination and highway design and maintenance
- 2 - Actively work on car design (they have vastly more executive influence than we.
- 3 - Forecast in their rate application the savings to be obtained by such activity (you will find no such forecast -- in fact Allstate says the 1971 cars are 50% more damageable than 1970 models -- and do nothing about it. DON'T INSURE THOSE CARS AT ALL and they will stop making them.

Additionally

- 4 - The upcoming no-fault insurance (which we insist must be a rider form) can do much to cut down on insurance losses and should be reflected -- so increase is not need.
- 5 - The upcoming \$100 deductible on all claims will in effect be an "out-of-pocket-premium increase" to the policyholders and a drastic cut in claims for companies -- it is not forecast in the applications (incidentally the companies get 60% discount on repair bills and the public will not) -- where is the industry surging the 60% discount -- as stockholder income?
- 6 - Years ago the automobile industry and the steel industry tried to submerge the infant Ford Motor Company. The elder Ford retaliated by producing an auto body from soy beans. I saw the motion picture of Henry trying to puncture that body with the pointed end of a fire axe. He was very energetic in those days and inflicted not a single dent. -- Wonder why the insurance industry doesn't put on a massive campaign for indestructible bodies like they did for the Tex matter not so long ago?
- 7 - Break up rate fragmentation by having established rate districts. Our latest thought (which will fit into our National plan) is to use the Pennet District areas (there are 11 of them (#7 seems to have been washed out).
- 8 - Windshields can be made of glass which will not rupture when struck by stones. You can see this on T. V. advertisements of glass people -- just why is it necessary to ever replace a windshield with such materials available. -- And just why are the insurance people so disinterested? I was told that when the \$100,000 deductible went into force they wouldn't have to pay for windshields -- there is the answer.

Note: The Insurance Company of North America is already advertising a "No-Fault" policy -- has it been submitted to you, and under what date did you approve it? (see Evening Bulletin 3/29/71 page 8)

Blue Cross 'Group' Plan Is Denounced

By DAVID M. CLEARY
Of The Bulletin Staff

Two spokesmen for consumers yesterday denounced the "group" system under which Blue Cross subscription rates are computed, and called upon State Insurance Commissioner George F. Reed to require a more equitable distribution of the costs.

Frank K. Jones, of Berwyn, president of the Citizens Committee for Ethical Insurance, an organization so impetuous that Jones does his own typing, called for total Blue Cross payout to be divided by a number of persons insured, resulting in a premium that would be the same for every-

David Seefeld, business manager of Retail Clerks Union 415, FL-CIO, complained that his members have low incomes, averaging \$2 an hour, but must pay high Blue Cross premium because of the greater incidence of illness in low income families.

No Increase Hearings
They testified during 1969 at the State Office, 1400 Spring Garden St., in a request for permission to raise premium to 29 percent.

ne

IMPECUNIOUS - Webster says "not having money -- habitually without money -- poor"

We adopt the slogan with pride. We are indeed habitually without money. We use ALL of the funds we receive for buying postage stamps, envelopes, and sending telegrams. Most of our "printing" is donated. Everything else has been paid out of our own pockets for six long years and continues.

and 1 - we NEVER charged anybody one single penny for any help we have given them. We don't brag, either.

2 - We have NEVER paid anybody one single penny for his services - including Frank K. Jones

We since we don't have money to hire an office force "we do our own typing" --With apologies for misspelled words, occasional skipped spaces, some overtyping). But then this is not a beauty contest.

We observe that most reporters do their own typing, in fact we know several editors who do their own typing. We sit down with them and "chew the fat" while they are doing it. Typing is an honorable activity which hardly needs nightlighting.

So IF YOU would like to have a copy of the FOUR LEGAL SIZE SHEETS single spaced which is part of what we submitted in our testimony at the

BLUE CROSS HEARINGS on April 16, 1970

send us a donation of \$1 for a set. We said A LOT MORE THAN WAS REPORTED and you will be interested in every word of it, or we will send you dollar back to you on request.

(Incidentally at the Blue Cross hearings of 1969 a certain reporter promised us a copy of HIS lengthy presentation -- written by his private stenographer? -- and we have never gotten it).

We didn't cause this insurance mess -- we have nothing to gain if it continues -- the PUBLIC has a very great deal to lose. We would think the News Media would be striving for the public.

"Agnewising" will just cause another outburst. Get things into the open COMPLETELY and LET THE PEOPLE KNOW FACTS EVEN IF YOU DON'T HAPPEN TO AGREE.

(Typed by Frank K. Jones. -- Sometimes I don't even know the time is now)

Highway Safety Luncheon - Insurance Federation of Pennsylvania - Oct. 2, 1970
Bellevue Stratford Hotel - Phila., Pa.

We are proud to have been included in the group invited to this luncheon and will endeavor to cooperate in any activity by submitting our experience over the last four years. Sorry we were not permitted to distribute a paper in full.

The Industry has a tremendous influence - it also has a tremendous responsibility.

Not too long ago a responsible safety expert remarked in print, that it was high time roads were designed and built to meet the habits of drivers, rather than try to educate drivers to accommodate the roads.

We believe that between the two thoughts lies the solution to road design and safety.

WE RECOMMEND THAT TOMORROW MORNING (even this afternoon!):-

WE STOP THIS INCESSANT TALKING AND ACT - for a starter ---

Get all traffic signs OUT OF THE WEEDS AND INTO FULL VIEW in your own area.

Get missing signs installed (the Highway Department a year ago said it could turn out signs in three days -- let's find out about that by action!)

Get CONFUSING SIGNS corrected - When a route goes to the right, the arrow should NEVER point straight ahead. We have been TWO YEARS trying to get one such sign corrected - without success. Want details and photographs?

Get CINDER BARRELS located on all hills ready for winter -- EMPTY barrels are available free or for a nominal price. Cinders are available.

Get speed limits that make horse sense and can be enforced without blushing.

Get SPEED ALARMS (not speed limiters) on all cars, so drivers can spend more time watching traffic than they do watching police and speedometers.

(General Motors "suggested retail price" is \$16.50 - factory cost \$4.00?) Those "Ghosts" in windshields can be completely eliminated for three cents!

Two years ago we succeeded in getting seven miles of highway paved from "Grass to grass", thus eliminating "dropoffs". That REDUCED maintenance costs in subsequent years, too. If we can do it, think what the Industry could have been doing all these years instead of penalizing the driver!

There are HUNDREDS of telephone poles in hazardous locations. We succeeded in getting some removed. We know of a lot more. So do you. ACT!

Our movie and still cameras are permanently active - want to help us?

We publish F A C T S that can reduce premiums and PRODUCE PROFITS.

There are, and always have been, too many studies, conferences, statistics, accusations -- and inaction. ACT PERMANENTLY

Insurance rates can come down and still leave a profit. Accidents can be reduced or be less severe.

Politics must be taken out of insurance. You play fairly with the public and we will see to it that you get a fair profit. We might even start writing what we know about politics in insurance, it isn't a nice story.

(please see other side and JOIN US or work with us)

The majority of our testimony has been based on information supplied by INSURANCE PEOPLE who are "reluctant" to stand out for fear of losing their franchises.

APPLICATION FOR FAMILY GROUP ENDORSING MEMBERSHIP

(includes ALL persons over 15 years of age residing at the same address (please have each sign). Not necessary
to either own or drive a car -- we cover EVERY KIND of insurance. We will not publish names of members --
a certificate of TOTAL will be issued as needed.

We attach the sum of \$1.00 to cover Family Group membership for the calendar year 1970. This is TO BE CONSID-
ERED AS A GENERAL SUPPORT OF THE PRINCIPLES OF THE Committee. It does not entitle us to voting
privileges. We may obtain that privilege by becoming active later.

We understand our involvement is under our own permanent control. We can become involved in any phase of the
activity in which we are most interested, or in the whole program, either in our own neighborhood, Statewide or
Nationwide.

The general purpose of the Committee is to obtain adequate and proper insurance of ALL KINDS, with the right
to use policies, and at a reasonable rate

Insurance companies are entitled to a profit, but not to a "milking expedition".

We want a CONSUMER ORIENTED INSURANCE DEPARTMENT (permanently) with sufficient strategically
located branches located for the CONVENIENCE OF THE PUBLIC.

We want to eliminate bad drivers, but the standards for judging them must be spelled out
We want to eliminate drunk drivers.

We want Insurance Industry permanently active participation in ELIMINATION OF HAZARDS.

Traffic Laws, speed limits, traffic lights, traffic signs, etc. must be less confusing.

Roads and highways must be designed for maximum safety of drivers and not for maximum benefit of land devel-
opers. They must be designed for minimum repair cost -- don't put concrete where traffic DOES NOT MOVE
and put blacktop where traffic DOES MOVE (especially at exits and entrances of expressways and at street
intersections).

We want a SAFETY DEPARTMENT in every County in the State, where people can report hazardous things: a
Department which will watch for accident clusters and get things corrected BEFORE deaths, accidents and
insurance premium increases happen.

your industry ~~SHOULD~~
ACT while it is
TALKING

FRANK K. JONES
President & Chairman Executive Comm.

March 1, 1970

We are attending a safety luncheon-planning meeting called by the Insurance Federation of Pennsylvania. The tentative date is March 20, 1970. We will continue our efforts as the "Loyal Opposition", non-partisan, and energetically press for A C T I O N.

We have used many published things from Industry papers, to show that they are very unclear on their position except that the Driver is at fault and they are losing money. For example we have repeatedly placed in our testimony before the Insurance Commissioner such things as the following:

In "Analogy" published by Allstate Insurance Company, we find in the SPRING 1968 (and this is Spring 1970, two YEARS later) report on conference in Northbrook, Ill.

"We need more effort; more SPECIFIC effort -- not something vague like 'drive safely'".

"Having spent 35 years in highway accident prevention, I was made to realize how few of our efforts were based on scientifically-proved facts". (and science doggedly seems to avoid the frailty of man built in by God Himself. So we say build roads to fit the man and not try to make man fit into what YOU ENGINEERS think is a road).

Asked how delegates to the subject conference on highway safety in Northbrook Ill. being referred to, were impressed, one of them replied "Have less 'sitdown' time. I used my brain too little and my backside too much". (WE HOPE THIS PRESENT CONFERENCE WILL PUT T H A T remark in large letters in the minds of participants. For our part, we will exert every effort to see it happens. To that end, we suggest that the morning following the opening session LACKING SIGNS BE PLACED ON THE FIRST SECTION OF NEW Rt. 202 at KING OF PRUSSIA, and that existing confusing ones be clarified. We have been taking pictures of these and publishing them, and asking for this action for over two years.

As to driver fault, we quote Mr. Hugh Miser, Vice President, Travelers Research Center and Chairman of the Research Advisory Committee of the Insurance Institute for Highway Safety - "I don't know how many miles one drives today between disabling accidents, but it certainly must be between 75,000 and 100,000 miles and there certainly are several million miles driven for every fatal accident.

"The question is, isn't that pretty good? I mean, drive a mile down the highway and think of all the hazards you have successfully avoided, (sic. and you underwrite without getting corrected) and then multiply that by these really big numbers. Aren't we doing pretty well

And from REPORT ON TOMORROW (which we thought was such a tremendously fine forecast of things to come that we secured a number of copies to place in strategic spots) published by The Journal of Insurance Information - January-February 1970, we pick the following gem -

"Most undersea ventures, being inherently high risk operations, represent a large potential for insurance coverages". WE THOUGHT YOU GOT THE "SHAKES" OVER HIGH RISES !!!

FRANK K. JONES
President & Chairman Executive Comm.

August 30, 1970

Hon. George Reed, Commissioner
Penn. Dept. of Insurance
Harrisburg, Pa.

Dear Commissioner:

The announcement of the October 2 luncheon conference in Philadelphia which has been called by the Insurance Federation of Penna. culminates another of our efforts to solve the insurance problem.

Our testimony before Commissioner Kelly, Commissioner Maxwell and yourself repeatedly called for involvement of the Insurance Industry and everybody else in ACTION.

We sincerely hope this will at last be an immediate and permanent ACTION. We will present to the luncheon our own paper on suggestions for "starters". This will include things which can be physically done starting on Saturday morning October 3. It will include things which will take a week or a month to get started. It will include things which will take considerable planning. It should be a constructive and pleasant activity.

Knowing full well that accidents will be greatly reduced, and knowing that losses will be greatly reduced, we now ask that you place a "HOLD" on all further increases until we see the result of these activities. If the Industry will truly put its weight and full energy to HAZARD ELIMINATION, then we can look confidently to our next request.

We ask that you look to requiring that insurance rates be DECREASED progressively to a sensible level. Economies to be accrued by reduction of accidents should not be permitted to be used up by mere overhead expense. We will from time to time introduce specific bills in the Legislature to further clarify the insurance activity in full justice to the Industry, the brokers and agents, and the public. These will be discussed with the Insurance Department and we fully anticipate they will be endorsed by the Department.

We appreciate the invitation to attend the luncheon and note you are also invited. Our total effort will be extended to the assembled group.

Sincerely yours,
CITIZENS COMMITTEE FOR ETHICAL INSURANCE

FRANK E. JONES
President & Chairman Executive Comm.

For distribution at Blue Cross Rate Hearing, Phila., Pa. 3/17/71

ENOUGH IS ENOUGH!

OUR GOAL NOW IS TOTAL GOVERNMENT INSURANCE

"Insurance Departments and Insurance Commissioners traditionally have had good channels of communication with the insurance industry. Experts in the field of insurance regulation point out that many Insurance Commissioners become pro-insurance industry, whatever their intentions, because they are continuously in contact with industry representatives and rarely get feedback from the public."

Herbert S. Denenberg, Commissioner
Report #1 to the People 2/26/71

"We receive the views of the insurance industry in abundance. We have trouble getting the views of the consumer organizations, who are often not on the job, who are often not informed, and who often get what the sleepy and the uninformed get in the market place the short end of the stick".

Herbert D. Denenberg, Commissioner
News release 3/11/71

Is it any wonder there is little feedback and that we get the short end of the stick?

Everybody knows what the industry and the medical field is going to say about its need for money, money, money, to fill its bottomless pit of professional luxury. So instead of giving them EVERY TIME the entire prime time and lots of it, why not reverse the procedure and let the public speak adequately first and put the industry in the off-hour darkness for a change.

Since 1962

For instance, our Committee (which has no paid employees and has never charged anybody for the vast amount of help we have given the public) has testified at every hearing on every subject the Pennsylvania Insurance Department has held on insurance matters from Harrisburg to the east (plus some in the west) — We doubt very much if ANY OTHER ORGANIZATION can make that claim). We had personal interviews with Mr. Denenberg because he was ever Commissioner. And yet we were forced to explain our "expertise" in Blue Cross matters, when our testimony before the Department time and time again set that forth. How many others were required to go through this to testify at this hearing? How could a private citizen possibly pass such a test?

And then, after a long and tortuous tress we finally were allotted (on March 12th)

TEN MINUTES AT 5 PM 3/17/71

That's after radio - T.V. - most of the press and the lions share of the public have gone home. **WHO'S AFRAID OF US BEING HEARD? AND WHY?**

We went through that affront during the regime of Comm. Kelly and Commissioner McNall. Commissioner Reed was a more understanding Commissioner and we often got a fair share of prime time — we thank Commissioner Reed for that consideration.

We are not accepting those nice noises coming from Harrisburg at present at face value.

We believe the preponderance of the indicated objectives are pro-industry at the expense the consumer and we ask time before the Department in public hearing to defend that opinion.

The main "cross we bear" is that we have no published membership list — we are not about to make such a list so the industry can computerize it and blacklist people. We went through that before — we rely on what we KNOW from talking every day to many many people, that the public is behind us.

COMMONWEALTH OF PENNSYLVANIA
INSURANCE DEPARTMENT
HARRISBURG

February 18, 1971

Mr. Frank K. Jones
President & Chairman Executive
Committee
Committee for Ethical Insurance
560 Woodside Road
Berwyn, Pennsylvania

Dear Frank:

I suspect wherever you go there will be earthquakes. Nevertheless, I look forward to hearing from you and seeing you in person.

I am considering putting together a consumer committee to advise the Insurance Department. Would you be willing to serve?

Let me hear from you.

With best regards, I am

Sincerely,

Herbert S. Denenberg

(Publishing these letters will close the door of the Insurance Department to our Organization, no doubt. That is no loss to us, but to the public - obviously the facts we had to present glanced off like water off a ducks back). We will try The Legislature and the Streets.)

COMMONWEALTH OF PENNSYLVANIA
INSURANCE DEPARTMENT
HARRISBURG

March 3, 1971

Mr. Frank K. Jones
Citizens Committee for Ethical
Insurance
560 Woodside Road
Berwyn, Pennsylvania

Dear Mr. Jones:

I'm going full speed ahead on putting together a consumer committee, and hope to be back to you shortly on this.

Best regards.

Sincerely,

Herbert S. Denenberg

When we received that letter, we were impressed and on February 22nd we accepted the invitation with the one reservation that "working on your Committee will not be a substitute for our own activities".

With the Blue Cross and Automobile rate hearings coming up, we worked hard to get together testimony.

We had personal invitations from the Commissioner. He informed him how much time we would need, and each time got less promised, so we had to rewrite to allotted time.

If the entire insurance mess was one simple thing, or if there was complete blame on one side and attributable to one thing it would be easier.

If we had access to news media as readily as the Commissioner - especially now that he has a fulltime professional from a station which makes us vast premises and doesn't come through - it would be easier.

When this letter came, we were even more hopeful, although by this time the news releases from his department were beginning to alarm us by the areas to be covered in hearings, and the news indication that the public was ending up with less protection than it had. The premium was suppose to come down.

But even if it did, you can count your bottom dollar it would very shortly rise again and you will end up with LESS INSURANCE FOR MORE MONEY.

If you don't believe that, hang this up in a convenient place and see it happen.

BETTER YET - Help us with your time and money to fight the thing.

(We might just finish writing our book !)

We were asked to furnish a copy of our testimony before the Blue Cross Hearing. We mailed the copy to the Department on March 8th.

I have to make a living and have to organize my own time for that purpose. I called the Commissioner on March 11th to ask WHAT DAY I should set aside for the hearing. He was busy, so I left word to return the call at my expense. Toward the end of the day, not having a reply, I sent a telegram

"Must arrange my personal business schedule. Requested testimony sent May 8. Advise what day I should set aside to testify at Blue Cross Hearings, in Phila.".

I have never received a reply to that telegram. On Friday the 12th I asked the Insurance Department in Phila. to use its own lines to ask what day I was to arrange for. By 2 P.M. I had had no reply, so I called again. Finally a call came that the 17th was set aside and I would have ten minutes, at 5 P.M.

That meant we had to rewrite our presentation to fit into that time.

On the 17th we sat in the hearing listening to many witnesses. We detected no effort to confuse, retard, or embarrass any of the witnesses.

The gentleman who preceeded me on the stand was accorded better than a half hour of time, including their questioning.

When I was called, the panel immediately started harassment and I explained I had to arrange my papers (they wanted me to sit down). Then I asked the Commissioner if the ten minutes I was informed by telephone I could have and the ten minutes the panelist said was all I could have, or the fifteen minutes advised in the two letters we received after the abortive telegram would control.

Well the debate on that point continued and finally the panelist informed me that my time was running. I never did get a ruling from the Commissioner.

So I looked at the large clock in the Courtroom (it said 5 P.M. and I had until \$10.) I kept watching that clock and short of the ten minutes the panelist said "your time is up" and raised a watch. So we wrangled over whether the court clock or his watch was the timepiece. We had a similar argument with Commissioner Maxwell over that same clock at a previous hearing. So Commissioner Denenberg remarked that "those clocks are never right" (City Hall Custodian please note).

Well we gained more by the argument than reading the abbreviated paper — it just goes to show what these hearings are really intended to be.

So before the gavel dropped I told Commissioner Denenberg on the record, that whereas we had accepted his invitation to serve on his "Consumers Committee" we would no longer agree to that because if he wouldn't listen to us here in public we could expect even less up there.

We had inquired of Dr. Denenberg himself (fact to face) as to whether there would be any conflict of interest in the public mind of him being Commissioner. Now we again pose that position.

- 1- He was (and still is) the Chairman of a Highway Safety Committee set up by the Pennsylvania Insurance Industry.
 - 2 - At that time he was "Loman Professor of Insurance, University of Penna" - We understand he is retaining this chair even as Commissioner.
 - 3 - On his Safety Committee (PACHS) was (he died recently, Mr. Denenberg told me) was Dr. Harry J. Lomas, Pres. Emeritus Amer. Inst. of Property & Liab. Underwriters Pres. Emeritus, Insurance Institute of America.
 - 4 - When he shouts to the hills that he "has trouble getting the views of consumer organizations (and we are about the oldest one in Insurance matters) and he treats us the way he did at the Blue Cross hearings, we question sincerity.
 - 5 - He is pushing for no-fault auto insurance — you will end up buying another policy and eventually, if not immediately, have to buy the one you now have also.
 - 6 - He is about to let the Insurance Companies drop small claims — you will find that the remaining policy will cost you the same if not more, for less coverage and we are willing to wager that before long there will be NO MORE PUBLIC HEARINGS and the insurance will be back at the old stand getting "rubber stamp increases".
 - 7 - WE WERE THE ONLY ONES HECKLED OR CLOCKED.
- We have nothing to lose — you do. Contact us if you want to help — don't dry later on, if you don't.

Keep this Insurance mess out in the light of day where it belongs!

WHAT KIND OF INSURANCE DEPARTMENT DO YOU WANT?

Frank K Jones
President

(UNPRINT)

(On March 12th we were assigned ten minutes to present a summary of our 9 page paper at 5 P.M. on March 17th, 1971 -- we have previously testified at all hearings on all kinds of insurance, since 1963) (note--subsequently we received TWO letters saying we would have 15 minutes -- finally got 8 minutes actual time OUR TURNING)

EDUCATIONAL MATTERS

Mr. Conradson-Lowery:

We mailed your Department an advance copy of our formal testimony on March 8th, at your request. This was the earliest we could get it prepared due to the short notice. We did, however, on February 19th acknowledge your personal invitation to testify and outlined the 29 areas of your paper which we would comment on in addition to our material.

I presume copies were made of that advance for others on your panel for preparation of possible questions. We have given copy to the stenographer and have additional copies if you did not bring panel copies along.

We are given the impossible task of summing up our presentation in ten minutes. Rushing on highlights makes it impossible for us to explain our position to the panel or for the Press and public to ever be able to adequately understand our thoughts obtained by pacing the sidewalks (without pay) and getting the thoughts of thousands of citizens over a wide area so we could present what we found. The 50'clock time is hardly the time when the audience would be above average in rise.

From things which have transpired mainly in the last few days, we now insist on TOTAL FEDERAL INSURANCE of every kind (or at least Federally controlled) and we offer the following suggestions on a stand-by insurance in the interim (health that is).

We also ask Federal laws declaring that all medical facilities, public or private, which receive any Federal money either as direct grant or reimbursement of services, shall become a public utility subject to regulation of the Federal Government.

We ask that you force the entire medical family, not only Blue Cross, to contain the cost of health services by denying the present application. In our main paper we have given a number of suggestions and we ask that our entire paper and exhibits as given to the Stenographer (including this summary) be made a part of the record.

We never have been, and are not now, looking at this insurance problem as of today with all the furor -- we are looking at it as it SHOULD be twenty years and more ago.

What we see at present not only irks, but downright shocks us. From the various recent news releases it looks to us as if the basic atmosphere is being deliberately engineered to favor the culprit insurance industry. This is evidenced by the lure of immediate lower premiums. Sweet music, indeed, but once its tailed, the premiums will go right on up and the public will be paying more for less. What is needed is a new definition of insurance -- and it is not 2022-05-20 00:00:00.

We are also rather adequately informed about the controlling of news - we, ourselves have been unfairly bobbled for some time past. That will leave a credibility gap which will keep this pot boiling for years and we will do our best to keep the steam on by resort to sidewalk activity, since the airways seem to be getting sterile of impartiality.

Now I know that our Committee, and I personally, and the public, do not have as much "accepted expertise" as some, but we sure do know when somebody is kicking us in the

face and the public is being kicked in the face right now.

The insurance industry has not only been subsidizing the computer industry at the expense of the public, but the Insurance Department has been accepting the data 100% and disbelieving human data from the public. That computer data is just as unreliable as you imagine ours to be when you ask us to explain our expertise when it is a matter of record in the Department over the years since 1963.

Do you realize that the figures you accept from the Industry is assembled as holes in cardboard by people who have no expertise at all and a slip of the finger can well alter the result — that this is progressively passed higher and higher until it reaches assembled form in the hands of "EXPERTS" who act on it to develop the desired logic and answer or else get fired? It's that simple.

I know you will immediately say that is the most ridiculous statement you have ever heard — but I repeat it. We question if you, or any other Commissioner has ever made a detailed audit of any individual filing and it is absolutely impossible to make a detailed audit of a combined filing. Simplify the rate structure, and you might be able to do it — and you will cut the fictionists' losses at the same time.

We note in the Phila. Inquirer of 3/14/71 an article headed "People just might replace computers". We say "PEOPLE M U S T replace computers".

We think that inasmuch as God brought humans into the world one at a time and since we leave this world one at a time, it is high time that we accepted that fact insofar as health insurance and medical attention is concerned. We believe that everybody regardless of social status or pecuniary substance is entitled to equal medical service. One way to do this is to make charges more nearly equal, if not entirely so. Groups have no prior preference so far as we are concerned. This will still not preclude those affluents who wish lavish attention obtaining and paying for it. We do not think the general public should subsidize any part of the marble halls where they receive this attention, however. Socialized medical care COULD be avoided, but we very much doubt if the influential portion of our society will PERMIT it to be avoided. Today is the Gettysburg of that battle — which way will we go?

ADVERTISING CAMPAIGNS — this is the seedbed from which the hogwallow insurance mess is spawned forth. I give you an envelope full of recent material in all kinds of media — full pages extolling bonuses for being sick. We have done this in other hearings. We ask you to jump on this thing with both feet here and now and stop!

PIRATING — another reason insurance goes up is that every company (not only Blue Cross) tries to gobble up 100% of the business. To do this they steal from each other in the large group area where the best business is. They progressively offer higher coverages at smaller premiums and end up with insufficient money. At the same time they automatically set the die for what non-group individuals who really need medical insurance have to pay out of their own pockets (Groups being "fringe payers").

We have asked every Commissioner from Commr. Kelly on down to obtain figures on what it would cost for equal insurance per person if everybody got the same coverage. We ask you to establish that figure as a guidpost, and give it full publicity. Cut out the credible and non-credible stuff — we say it is "Incredible".

Your news release of 3/12/71 on Blue Shield covering doctors services for patients in extended care facilities was received 3/15. This same thing is bound to come up in Blue Cross and other insurance coverages, so we will inject it here.

We are in complete favor of the THEORY of this. We are NOT in favor of setting the precedent now. Wait until the Legislature has passed laws which will contain the cost area of extended care facilities of every kind, be it nursing home, rest home, lying in hospital, geriatric hospitals, recuperation homes, or anything else (our plan includes very low cost operating at a highly dignified level).

DON'T let that group of facilities develop into another hogswallow like the hospitals became, and then we have another mess to clean up. Savings over present hospital costs may be highly deceiving.

We have made a survey of such facilities (we think you should first make a similar survey before you rush blindly into ruling on the Blue Shield request.

We have placed in evidence the brochures and prospectuses of such ventures for private profit. Rates run as high as \$350 per week and it is stated that a considerable amount of the operating receipts (and profits) will be from Medicare. There is your hogswallow staring already — in fact it is already in operation.

If you believe the lush insurance industry is going to abandon any part of its high living, you are naive. Their cost accounting requires hard-nose examination.

We ask that you seek legislation to set up ten insurance districts (fully staffed & and we will tell you how to finance it without additional taxes). These districts would be for rate making purposes, for medical attention coordination purposes and for population distribution purposes. They would be useful even when National insurance comes into being in the future (and it certainly is coming). We give you a map of our suggestions, it ignores topography and follows county lines for obvious reasons. We prepared this as part of our study on rating areas which was announced by Commissioner Reed. If you continue that (and we hope you do) we will want to testify and let you have the benefit of our talks with a great number of people and insurance agents.

We place the dedicated purpose of the Citizens Committee for Ethical Insurance at your disposal — which includes my own personal professional experience in auditing a number of hospitals and wide conversations with medical men, some of whom were clients in my personal business of Consultant to Small Businesses.

Thank you.

Not on the original paper, which we were prevented from fully reading.

FOOTNOTE: Subsequently we withdrew our offer to serve on a Consumer Group at the personal written invitation of the Commissioner. We were subjected to deliberate harassment and restriction of written scheduled time at the hearing and we could see no possibility of any service to the public if we were to be subjected to the "tripping" we received in public. We prefer to remain independent and will place our efforts on the streets.

Committee for Ethical Insurance
560 Woodside Rd., Berwyn, Pa.

Hearings on B lus Cross of Greater Philadelphia, 9 A.M. 3/17, 3/18, 3/19,
1971 - Room 296 City Hall, Philadelphia.

Testimony presented for the Committee by Frank K. Jones, President

Mr. Commissioner, in accepting your invitation to testify at these hearings, we advised you that we hoped to present our own National medical service plan at this hearing. Unfortunately it is not yet ready for release. The general idea has been discussed with a good crosssection - including State and National Legislators.

We also wish to officially state to you, as we have to former Commissioners Kelly, Maxwell and Reed, that we are more interested in the insurance outlook twenty years from now, after this howl and cry is over, than we are in the present turmoil. We want meaningful legislation which will prevent a recurrence of the present inexcusable debacle.

We have heretofore testified at hearings that insurance of every kind is indispensable in modern life. Unfortunately the Industry doggedly insists it is a private enterprise for profit and the newly evolved "Plans" seem intent on building lucrative private clubs rather than accomplish original purposes.

We contend that the entire Industry has been subsidizing everything without organized continuous and purposeful elimination of hazards and costs of which they were aware -- they used to deny this, but in the January February 1971 issue of the Journal of Insurance the President of one company ask "Must insurance subsidize society?".

Our answer to that is, no they do not have to subsidize everything. Let a risk, imagined, actual or forecast, arise and they rush headlong into covering it with a verve.

They are now apparently intent on subsidizing the computer industry. This technology makes it practical to build up a tremendous proliferation of risk classifications which it was impossible to do with the pen and pencil. We question the cost of these procedures can be justified.

The procedure up until now has been to supply medical service to upper echelon and major employee groups at ridiculous prices because this is where social prestige and political influence is concentrated which could upset their "private club tranquility". Now the industry has responded to the inevitable

public outcry by coming into the open with its avowed political activity. Previously the activity was just as real but was carried on underground.

There is an apparent intent to deprive full equal service to those who most need it -- probably to force an outcry and force the Government to take over that section of insurance (in each classification) which the industry prefers not to cover. This would then leave them with the "best cows to be milked".

Already the Government is speaking of a \$50 per month family charge for all hospital and medical attention. That is \$600 per year and is based on the presently established mad hog wallow price structure, which simply MUST NOT CONTINUE. It means that most low income people will have to be on the relief rolls and the rest of us pay the cost on top of a deliberately engineered ridiculous cost. The only ones to benefit would be the Medical/Insurance family. It will kill the dignity of men and bring on total socialized medicine.

We introduced in evidence at one hearing of the Department the brochure of one nursing home group in its stock offer, stating that it was anticipated to receive a substantial return from Medicare services. The charges of that home could only be met by affluent people, but at the same time, would milk money from the Medicare funds which were needed to take care of less pretentious services to less affluent folk.

On the other hand, our own Committee's plan will give reasonable medical attention without the ridiculous schedule of charges.

ADVERTISING CAMPAIGNS induce gross inequities and high costs. We hand you, as we have handed other Commissioners, some advertising material of recent date -- mail, stuffer, fullpage newspaper. You should jump on this kind of thing with both feet right now and stop it. We have asked this action time and time again without success. It is the root of the insurance evil. We know of at least one newspaper editor who will not accept such advertising because he thinks it is not "good for his subscribers". (don't try to guess which editor -- you would be entirely wrong -- this particular paper has never printed any of our releases.

The advertising of wild-eyed offerings of vast wealth creates the hog wallow in which the hospitals and medical men, as well as the insurance companies revel. It makes the "Ready Cash" props.

The availability of cash is the basis on which medical charges are based at every level -- doctor, hospital, insurance policy etc. Years ago when Abington Hospital initiated the Intercounty Hospital Plan, it was the first in the Phila. area. I was on the hospital auditing staff of a prominent Public Accounting Firm at the time. The industrialists on the Board of directors of one hospital asked if they should join the plan. We told them they should, since it would mean they could collect their accounts receivable -- and without a pause one member of the Board said "Yes and we can increase our rates".

Our suggested remedy to this is to stabilize the industry and medical services by forming a Federal Authority of a "Mild of London" type to license all insurance companies. The Authority would have a subdivision Federal Health Insurance Pool finance by assessments on all insurance companies to control the operating matters. The Main authority would be the "Reinsurance and High Risk pool".

We believe the Insurance Industry Family could do much themselves to stabilize things and start getting insurance back on proper track. They could have a self-appointed CEAR who could certainly have secured results equal to those obtained in sports. One of the highlights of our efforts was the many conferences we had with J. Harry La Brum. The sincerity and objectiveness of this man was so great that we suggested he be named the CEAR of the industry in our testimony and elsewhere. He could have done a job which the Public would have applauded. He had a desire to solve things and we learned from his lips some of the things which even he refused to condone on the Industry side of the fence.

But when we made our initial suggestion back in Commissioner Kelly's days, the published reaction of the Industry, through its official public relations arm, was that "they trembled at the thought of a CEAR -- it would destroy competition".

We believe that our suggest F.H.I.P. setup will bolster weaker elements of the entire medical system, would do much to reduce costs, provide personnel and permit a more uniform quality of medical care

throughout the United States. This coupled to a transportation grid would permit facilities to be established in underdeveloped areas and have them ready when the area is developed -- in the meantime they would bolster to built-up areas. It would have other advantages covered by our plan.

DONATED FUNDS -

Now medical attention is one thing everybody is vitally interested in. It is one of the heartstrings of America. That is the reason the many laudible fund appeals find the public rising to the call to carry on research, build hospitals, help hospitals with operating costs, and assist the less fortunate with medical services.

It is therefore downright frustrating and alarming to face the situation where you, journals, are in need of the things you contributed to help time and time again, only to find that you are financially unable to obtain them -- unless, of course, you are willing to pour your substance into the new of medical practice, become a pauper and then qualify.

A thorough airing of just what happens to all the funds collected, should be undertaken -- it would have a salutary result. I know during my own auditing experience we were continually requiring funds be removed from expansion programs and placed into operating funds where the public was led to believe they would be used. Our Committee can inform you of the deliberate squandering of money on a hospital construction -- in fact we can show you the thing in motion pictures.

IMPORTANCE OF MEDICAL INSURANCE - In our opinion this coverage is the most important of the entire field -- it also affects the majority of other forms of insurance, especially automobile insurance. We find that Life Insurance Companies (in direct statements to us by top officials) are not concerned with highway deaths "because they are so few in relation to the total claims". We also fail to detect any great movement on the part of the Automobile Casualty people to reduce their claims by better medical costs. They are only very recently getting into our design and road hazards -- a very late start in attitude from plain "subsidizing".

One of the reasons the companies (including Blue Cross) are short of funds is that in their individual company scramble for the market (they insist it is a losing market) have pushed a policy which is not needed (thus forcing a need). As one company comes out with one idea, the others strive to surpass it, at the same price or better -- then demand rate increases to cover up. In doing this they leave holes in coverages, necessitating purchases of other policies. A classic instance is the problem of the elderly. Medicare, must be augmented by 65 special and other forms. By this time one single policy should be in existence to take the worry and uncertainties out of the minds of our senior citizens. Your Department should ride hard until such a policy is obtainable at reasonable rates.

SPECIAL POLICIES AND RATES:

We are mindful of the very favorable rates available to some organizations and groups (particularly the news and broadcasting radio). Some of these are policies sold by commercial companies and some are self-insuring policies. However, what is available to some can certainly be made available to all on a much nearly equal basis than at present. If you will collect this information and publicize it as to rates and coverage (without mentioning names, of course) you could very well break the Gordian Knot.

A publication of this sort could be the Bible of the Consumer in knowing what he should be able to get in insurance. With this criteria available to the customer, the companies would be held in control and still have room for legitimate competition. Many people come to us asking "that is a Good Company and what is a good policy" -- we wish we could answer that one.

FINDING - In my own capacity as a Consultant to Small Businesses, I find my own clients being dogged by insurance representatives to leave their present insurance company and come with another with greatly expanded benefits at very little additional cost and in some instances at even less cost.

Now the worst part of that procedure, as we have testified to this Department time and time again, is that most of the large group plans are already, or are rapidly becoming, "fringe benefits". The employee pays nothing and the total cost is passed on to the consumer, plus overhead, in sales price.

The employer isn't hurt, the employee is pleased, and the insurance company has insufficient funds. There is then that sudden sinking feeling in the stomach of any individual leaving the group by retirement or other cause and becoming conscious of what was being done behind his back as he now dies into his own neck.

The ideal thing would be for every individual to pay for insurance. If this were so, the outcry from the streets would be many fold worse than it is.

That not being possible, we think the next thing is to strive to get as closely as possible to where the cost per subscriber (regardless of who pays the bill) is almost identical for the same service or coverage, and regardless of size of group he is in.

We have asked before and just for your own information (even if you use it as a way to prove that we are wrong in our viewpoint), we would like to see you compile the following:

Credible groups

Total persons in largest five classes, median five classes, smallest five.

The coverages accorded to each of these

The premiums for each of these

divide the above into categories

(a) employer pays entire premium

(b) employer pays part premium

(c) employee pays entire premium (employer pays nothing)

Total claims paid out in each category

INCREDIBLE GROUPS get same information

HOW GROUP INDIVIDUALS get same information

Now divide the number of individuals into the claims paid, to get the average per person. Then add the whole mess together and divide by total people covered and see how that average figure compares.

Then determine how much electronic equipment, how many highest rentals and other overheads can be eliminated from the administrative costs. We think with this kind of arithmetic you can get a more equitable premium.

Oh yes, that brings a howl from the employees layed off — but they aren't layed off — they go to work (as we testified before) on weeding out unwarranted service charges, overcharges, unnecessary things and HAZARDS. That will pay their entire salaries and leave a very large plum to further reduce the premiums.

Another advantage to be gained is that your own Department would have a filing presented to you which could be understood. We contend that the very inhumanity of the current system of fragmented rates and classifications makes it impossible for you to keep up with it. They have more "fire power" with their total computer equipment than you have with yours. And when you merge a lot of statistics from many companies and file jointly through a Rating Bureau, you might as well take the figures from a calendar. As an auditor, I would hate to certify to such figures. How can you possibly know how many trade association costs, how many lunch conventions at vacation spas, how much high rental to insurance industry satellites, what poorly allocated salaries etc etc are included?

BASIC POLICIES - We think that your Department (or the suggested FHIP) should draw up "minimum policies" which every company must market in order to be given a license to operate in any State. The fear of the policy should show that basic premium and a schedule of possible rider additions that can be had. The premium of each rider should be sufficient to cover that rider and not be a bonus as is now done. And the riders should carry a lions share of the "plant cost" of the hospitals etc.

You attached a copy of your ten suggestions of areas for improving the present situation. The following are our direct comments on these items and we will cover as many of them as our assigned time permits. We ask that all items not covered be entered on the record as if we had covered them.

- 1 a - A very serious study and prompt solution of this matter of reimbursement methods must be made. The present paper work (which is not standard as to all companies) which is generated even retards the reimbursement and causes avoidable heavy expense both to the hospital, the medical men, and Elus Grose. The simplification of the policy coverage will eliminate a vast amount of the cost and confusion.
- s - Fostering of group practice prepayment plans. We are opposed to the continuation of stress on group coverage. The benefit gap between various group sizes and individuals, not only causes tremendous costs in record keeping, but is contrary to the concept of insurance, which is the sharing of risk by the many.
- d - Depreciation is in effect a deferred maintenance charge. Proper current

maintenance should restore depreciation wastage. Rather than accelerate Depreciation, we think building depreciation and major equipment depreciation should be adjusted downward to some extent by the actual cash maintenance expenditures each month. Many hospitals are built and equipped by donated cash and the total replacement in all probability will be done with donated cash.

- f - Reimbursement of low utilization facilities. The PHIP we suggest might well work out with various areahospitals just what facilities are needed. Then instead of each hospital being in total competition with each other, they would be in total cooperation with each other in rendering a full broadbased medical service. Not every hospital would have the identical facilities, but each ~~must~~ area would have what is needed, available to patients of any hospital. (In this connection our Committee's suggestion of ten insurance districts in Pennsylvania might produce the basis for determining area hospital equipment). Some excess standby facilities must be available and might well be subsidized by PHIP.

Open heart surgery is becoming a much used benefit. We think there must be a special study made as to how this can be made available at better cost to those who are not covered by the delux hospital plans. In low utilization hospitals, the cost should be equalized by PHIP or the patient should be assigned (along with his own doctor even if not accredited to that hospital) to a hospital which is designated in that area for such service.

- j - Bad debts should be eliminated entirely from costs. There should be an interhospital fund set up to reimburse themselves for bad debts. The agency supervising this reimbursement should conduct a hard-nosed audit of what charges are on bad debt accounts to see if the very improper nature (such as unrendered services) charges might be the cause of the bad debt and refuse to reimburse that loss. This would be a self-policing of improper charging and unnecessary services.

Research costs should not be reimbursed. There are ample funds donated for such things and these funds can be obtained. This does not, of course, mean the normal laboratory tests -- it refers just to longterm exploratory research which is using the hospital equipment and patients as a ready laboratory in place of establishing an self-contained commercial enterprise elsewhere.

- 2 a - The State should be divided into Insurance Districts (ten of them). Each district could then also be a Hospital Utilization district. The object would be (under PHIP) to endeavor to spread out the various facilities so as to obtain maximum utilization. Then the individual utilization would be a lot more meaningful for rate study.
- c - Some reasonable guideline of required hospital stays should be worked out. We think this again should be done by PHIP, in cooperation with the medical profession (We are not questioning the dedication of the medical profession -- we are proud of them -- but the present escalation of costs has even them rocking on the rope.. In our opinion "recuperation and rehabilitation" joint facilities would have a major effect on this problem.
- d - Not much use debating this -- disallow it in one place and it would be buried skillfully in another. a proper "hardnosed policing" of hospital bills will go a long way to correcting the matter.
- 3 a Disclosure of Blue Cross/Hospital contracts. Since Federal and State funds are permanently locked into payment of hospital bills, the private contracts should be a matter of record in the Insurance Department where proper committees from the Legislature could examine them. It is correct that the Insurance Department should keep well abreast of such contracts.

This is needed to keep the lid on radical medical cost increases just to make a high-level professional income for some at the expense of the public.

- b - We question the desirability of advising patients the cost of the services shown on their bills. We doubt if the vast majority of the patients would know what it was all about and might suffer a heart attack trying to work it out. In addition the cost of doing such a thing would be indefensible.

3 b
cont'd

However, we do think that every bill should have on it a prominent footnote "If the patient has any question as to any charge hereon, particularly as to whether the service was rendered, he has the right to refer the matter to the Penna. Insurance Department in Harrisburg, Pa."

Such a note would help greatly in breaking up those improper charges because "you don't pay the bill, so why worry".

- c With the Insurance Department and other proper Government agencies watching the interests of the public as well as the hospitals, it is hoped that there would be a minimum of things the public should watch. It is desirable that the hospitals be spared the tremendous cost of making miriads of unneeded "whin reports". A simplified medical coverage will release hundreds of hands to do necessary medical operating things which are now not done or inadequately done. This, in itself, should further cut down on costs.
- d Cost of per diem charges by hospitals should be publicized twice a year, particularly to the Legislators. We recommend that this be on the basis of the Insurance Districts previously mentioned for ready comparison. Then the Insurance Department in cooperation with the suggest PHIP should delve into the reasons for the discrepancies and endeavor to minimize them, knowing full well that you just can't get equal costs in every unit.
- e Not only should there be a disclosure of payments to such specialists who are not on a fixed annual salary and on the fulltime staff, but the matter of supplying sufficient help should be the function of the suggested PHIP. In my own experience, an anesthesiologist was billed by the hospital and the same technician sent an additional personal bill because the hospital scale was not high enough.

We do not question adequate pay for medical experts and technicians but we think their own associations should set some reasonable guide lines

At the last Blue Cross hearings in Phila, we and others suggested that your Department obtain lists of everybody receiving over \$10,000 per year, especially the technologists and then crosscheck each list to locate the same name appearing on more than one hospital list -- I knew, professionally, that such things did occur and presume that they still do. A little light could have a great effect in reducing costs. (Our own plan, when released will chart the way.)

- 5 c We recommend that something be done along the lines of having standard hospital plans drawn up for buildings, allowing for expansion. The facilities would then be more familiar to changing personnel and save much in construction and operating costs. This is mostly adaptable to new construction in open rural areas where the maximum load is still in the future. It permits those rural units to better function as standby and auxiliary facilities for urban plants, especially during crisis.
- 6 b Duplication of benefits, and/or duplication of reimbursements should be prohibited (as suggested in our remarks on advertising). Since such duplications are based on the premise that some policies do not cover certain items, it is imperative that the policies offered to the public must be strictly regulated so the consumer is not faced with a bewildering maze. This clarification of policies will, in itself, vastly cut down on the paper work and operating costs of even the insurance companies themselves, as well as hospitals.
- c This point is covered by our prior remarks asking for basic minimums which cover MUSTS, plus riders covering non-essentials at additional adequate premium.
- 7 a The matter of pre-admission testing and usage of outpatient care must be a matter to be supervised by an agency such as PHIP so as to gradually circumvent the unnecessary hospital entrance and length of stay and the services used on admittance. In other words, medical practice should again revert to a service and not to expand further into a research effort. Such control must be monitored by a meaningful department of PHIP.

- 7 f Looking to the eventual (and obviously unavoidable) Nationalization of medical attention at all levels - it is imperative that all account and reporting forms (ALL PAPER WORK) become uniform as promptly as possible. Those who are opposed to nationalization should be the loudest in calling for this standardization because it will permit proper comparisons which are impossible now. The present confusion precludes fair evaluation of either to the medical community or to the public.

- 8 a The public has only recently become aware of the fact that the Blue Cross organizations are under the control of the medical community. The Board should be service oriented, certainly not a political football, nor a medical/insurance company bonanza. Possibly only by area or state board supervision (PHIP) can such broad principles be attained. Otherwise it can be ego/competitive.

Blue Cross must be, what it started to be, a purchasing agency for the public. There is even frailty in that concept, however, in industry.

Until very recently, at least, Blue Cross has resisted public information. We bring to your attention our testimony in the hearings on Blue Cross in Phila. on April 16-17-18, 1970. We ask you to review that testimony and make it a part of the record of this hearing. In that we reported the downright arrogance of the Blue Cross officials in refusing to let us have access to papers on the filing. Following that hearing, we were given the courtesy of talking to those who should have been available without the unpleasantness. We think the entire medical community and the Blue Cross (the same as insurance companies in other fields) is engaged in "pulling the wool" over the eyes of the Insurance Commissioner for the benefit of others than the public. Up until now the smirk on their faces has been even visible -- we find the smirk has been gradually disappearing, but the intent remains obvious. We for our part, will continue to fight.

- b We believe there should always be a consumer representative on all boards such as Blue Cross. Consumer groups themselves are not enough. There is no communication between consumer groups either and that is a calamity. Do not for a minute think that whereas Blue Cross started consumer oriented and became a desirable employment haven to be protected, that consumer groups cannot become the same. We hope your office will forever hold public hearings on rate increases to avoid the quiet "job pools" perpetuating.
- c We think that not only all Blue Cross subscribers, but that every other policyholder of every other type of Insurance should receive notice of requests for rate adjustments, plus notification of availability of appeal for help from the Insurance Commissioner, plus notification of the Insurance Commissioner by the Insurance Company/and or plan of each and every cancellation, refusal to renew, or refusal to sell.

We do not believe that either the public or the Insurance Commissioner is fully aware of what is going on. In fact, we note that you, Mr. Commissioner are asking for 50,000 policyholders to enter protests in automobile insurance. If what we have been asking for eight long years had been done (and we repeat that request above) you would have that 50,000 plus some 100,000 more protests right now. We will ask legislation on this particular point this year.

- d Yes, most decidedly policyholders should be advised of hearings. Just start this kind of notification and the number of requests will subside to what is really required and stop the "fat-calf-living" of insurance people.
- e We believe that if special T.V. forums were arranged at least once a year, or that some portion of the annual meeting of Blue Cross would be televised (like school board meetings etc), that people would become more interested because they would be better informed. At present most are simply disgusted and don't trust anything including Blue Cross and the Insurance Department itself.

It would also be meaningful if the Press (I mean a joint press-club) would hold televised interviews - excluding politicians and get down to earth discussion and debate at the people level.

- 9 a to f We believe the answer to a to f items in this category can be grouped as no.

Since health is an individual matter, health insurance is an individual matter.

If every health agency is controlled through the suggested RHP then you would have uniform standards, you would have uniform coverage, and you would have uniform charges.

Insurance charges should never be paid. The real thing is that they should never be charged in the first place. Merely refusing to pay such charges is not the answer, because as an accountant, I know full well they will be buried somewhere else where you don't see them. You have to restore cash to the properly operated health agency. The answer is to have a health agency which does not want to live in ivory towers, especially when they are not being watched.

We are opposed to group coverage at special rates, especially when they carry more benefits, and this applies particularly to the medical field.

In our opinion the concept of credible and non-credible groups is an archaic premise which can't stand the test of human application. Arithmetic is a very inhuman thing. It has already been carried to the point of popular outcry — let's not carry it further to popular demand for socialists. In fact we will on the Penna. State Legislature to outlaw the concept of-credible/ non-credible and get down to health insurance.

- 10 a to c Yes the public can be better informed about the cost and dangers of over-utilizations, — and its own part in stopping such use. We think it could, and should, be in the form of the "forums" heretofore suggested. Such forums should be frequent and have uninhibited people participation and just not a platform for top officials to expound and cover up.

It could also be in the form of properly drawn leaflets or pamphlets, handed to each patient or attached to each bill to a patient. We think a "news short" at very frequent intervals on T.V./radio (possibly sponsored by the Advertising Council of America — or the insurance industry) would be very helpful.

Possibly a leaflet for insertion AT NO CHARGE in the newspapers, like they put the myriad of bargain rate insurance advertising material, would be helpful.

And above all, we think that HARD-NOSE POLICING OF ADVERTISING CAMPAIGNS by the Penna. Insurance Department (and the suggested Insurance Industry CTR) which induce the overutilization, would be a prime curb on the practice.

And then maybe a public display of intentional overcharges might have an effect.

- 0 - 0 - 0

- 10 SUM UP - We think that inasmuch as God brought humans into the world one at a time, and since we leave this world one at a time, it is high time that we accepted that fact insofar as health insurance and medical attention is concerned. We believe that everybody regardless of social status or pecuniary substance is entitled to equal medical service. One way to accomplish this is to make charges more nearly equal, if not entirely so. Groups have no prior preference so far as we are concerned. This will still not preclude those affluent who wish lavish attention obtaining and paying for it. We do not think the general public should subsidize the marble halls where they receive this attention, however. Socialized medical should be avoided, but we very much doubt if the influential portion of the public will HERMIT it to be avoided. Today that battle is being fought. In what way will we go?

- 7 f Looking to the eventual (and obviously unavoidable) Nationalization of medical attention at all levels - it is imperative that all account and reporting forms (ALL PAPER WORK) become uniform as promptly as possible. Those who are opposed to nationalization should be the loudest in calling for this standardization because it will permit proper comparisons which are impossible now. The present confusion precludes fair evaluation of either to the medical community or to the public.
- 8 a The public has only recently become aware of the fact that the Blue Cross organizations are under the control of the medical community. The Board should be service oriented, certainly not a political football, nor a medical/insurance company bonanza. Possibly only by area or state board supervision (FHIP) can such broad principles be attained. Otherwise it can be ego/competitive.

Blue Cross must be, what it started to be, a purchasing agency for the public. There is even frailty in that concept, however, in industry.

Until very recently, at least, Blue Cross has resisted public information. We bring to your attention our testimony in the hearings on Blue Cross in Phila. on April 16-17-18, 1970. We ask you to review that testimony and make it a part of the record of this hearing. In that we reported the downright arrogance of the Blue Cross officials in refusing to let us have access to papers on the filing. Following that hearing, we were given the courtesy of talking to those who should have been available without the unpleasantness. We think the entire medical community and the Blue Cross (the same as insurance companies in other fields) is engaged in "pulling the wool" over the eyes of the Insurance Commissioner for the benefit of others than the public. Up until now the smirk on their faces has been even visible -- we find the smirk has been gradually disappearing, but the intent remains obvious. We for our part, will continue to fight.

- b We believe there should always be a consumer representative on all boards such as Blue Cross. Consumer groups themselves are not enough. There is no communication between consumer groups either and that is a calamity. Do not for a minute think that whereas Blue Cross started consumer oriented and became a desirable employment haven to be protected, that consumer groups cannot become the same. We hope your office will forever hold public hearings on rate increases to avoid the quiet "job pools" perpetuating.
- c We think that not only all Blue Cross subscribers, but that every other policyholder of every other type of Insurance should receive notice of requests for rate adjustments, plus notification of availability of appeal for help from the Insurance Commissioner, plus notification of the Insurance Commissioner by the Insurance Company and or plan of each and every cancellation, refusal to renew, or refusal to sell.

We do not believe that either the public or the Insurance Commissioner is fully aware of what is going on. In fact, we note that you, Mr. Commissioner are asking for 50,000 policyholders to enter protests in automobile insurance. If what we have been asking for eight long years had been done (and we repeat that request above) you would have that 50,000 plus some 100,000 more protests right now. We will ask legislation on this particular point this year.

- d Yes, most decidedly policyholders should be advised of hearings. Just start this kind of notification and the number of requests will subside to what is really required and stop the "fat-calf-living" of insurance people.
- e We believe that if special T.V. forums were arranged at least once a year, or that some portion of the annual meeting of Blue Cross would be televised (like school board meetings etc). that people would become more interested because they would be better informed. At present most are simply disgusted and don't trust anything including Blue Cross and the Insurance Department itself.

It would also be meaningful if the Press (I mean a joint press club) would hold televised interviews - excluding politicians and get down to earth discussion and debate at the people level.

- 9 a to f We believe the answer to a to f items in this category can be grouped as one.

Since health is an individual matter, health insurance is an individual matter.

If every health agency is controlled through the suggested RHP then you would have uniform standards, you would have uniform coverage, and you would have uniform charges.

Improper charges should never be paid. The real thing is that they should never be charged in the first place. Merely refusing to pay such charges is not the answer, because as an accountant, I know full well they will be buried somewhere else where you don't see them. You have to restore cash to the properly operated health agency. The answer is to have a health agency which does not want to live in ivory towers, especially when they are not being watched.

We are opposed to group coverage at special rates, especially when they carry more benefits, and this applies particularly to the medical field.

In our opinion the concept of credible and non-credible groups is an archaic premise which can't stand the test of human application. Arithmetic is a very inhuman thing. It has already been carried to the point of popular outcry — let's not carry it further to popular demand for socialists. In fact we call on the Penna. State Legislature to outlaw the concept of-credible/ non-credible and get down to health insurance.

- 10 a to c Yes the public can be better informed about the cost and dangers of over-utilizations.— and its own part in stopping such use. We think it could, and should, be in the form of the "forums" heretofore suggested. Such forums should be frequent and have uninhibited people participation and just not a platform for top officials to expound and cover up.

It could also be in the form of properly drawn leaflets or pamphlets, handed to each patient or attached to each bill to a patient. We think a 15 "news short" at very frequent intervals on T.V./radio (possibly sponsored by the Advertising Council of America — or the insurance industry) would be very helpful.

Possibly a leaflet for insertion AT NO CHARGE in the newspapers, like they put the myriad of bargain rate insurance advertising material, would be helpful.

And above all, we think that HARD-NOSE POLICING OF ADVERTISING CAMPAIGNS by the Penna. Insurance Department (and the suggested Insurance Industry CZAR) which induces the overutilization, would be a prime curb on the practice.

And then maybe a public display of intentional overcharges might have an effect.

- 0 - 0 - 0

- TO SUM UP - We think that inasmuch as God brought humans into the world one at a time, and since we leave this world one at a time, it is high time that we accepted that fact insofar as health insurance and medical attention is concerned. We believe that everybody regardless of social status or pecuniary substance is entitled to equal medical service. One way to accomplish this is to make charges more nearly equal, if not entirely so. Groups have no prior preference so far as we are concerned. This will still not preclude those affluents who wish lavish attention obtaining and paying for it. We do not think the general public should subsidize the marble halls where they receive this attention, however. Socialized medical COULD be avoided, but we very much doubt if the influential portion of our society will PERMIT it to be avoided. Today is the Gettysburg of that battle — which way will we go?

Testimony of Citizens Committee For Ethical Insurance, Berwyn, Pa. presented by Frank K. Jones, President before Insurance Commissioner George F. Reed, Phila., Pa. April 16-17-18, 1970 in the matter of rate increase application of
BLUE CROSS - PHILADELPHIA

An Article "viewpoint" published in the Sunday Philadelphia Inquirer of April 12, 1970 quotes R.D. Chapin, Jr., Chairman of American Motors Corp. as saying

"had business been less effective in meeting consumer demands for better goods and services, life would be considerably more stable."

"The question that must be answered, concerns whether progress has been worth the problems".

We think that same thing summarizes our own testimony on Insurance all these years.

The Concept of insurance in the United States is very much "on the spot". We are at a high-water mark in insurance history. We are at a point where we either have well-considered equitable insurance under private enterprise (which we sincerely hope it will be), or we are going to have a kind of socialized Government insurance brought about by the clamor of the public. If we have the latter, the Insurance industry will be to blame, because it made all kinds of insurance necessary and then works to deprive those who need it most.

Insurance is one of the most necessary things in our economic life, next to food and clothing. We could not and can not progress without it.

There is nothing more important in the insurance field than life insurance and health insurance. God made man and he made him frail, and he made him subject to all kinds of ailments, including death, and he did not exempt anybody from these hazards. The insurance industry acknowledging and seeing this, developed a lot of plans and then the sheer magnitude of the population explosion brought about some things they had not contemplated and they did not keep abreast of it.

They caused problems to be created because, with an eye only to pure profit, they tried to phase out everything and everybody which in their opinion seemed to cause a so-called loss. They did this rather than adjust the industry to changing times. They created policies they cannot afford to sell and in doing so actually established socialism of a sort.

They are only now becoming conscious of the fact that possibly, to use their words, possibly they have some responsibility to look into the social aspects of insurance. And if they do not look into the social aspects of insurance, the Government will have to do it for them. We have some instances of this in the Social Security laws, the FDIS laws, the new flood and storm damage laws, Medicare and Medicaid, Fair plan fire insurance etc., all caused because industry did not voluntarily do the necessary.

In the opinion of our Committee, in the matter of health insurance, including hospital and medical coverages, the industry is showing up in its worst light. These particular kinds of insurance affect every other kind of insurance to some extent, most particularly the automobile insurance.

But dwelling entirely on the health phase, we have already testified to your Department a number of times that the Blue Cross groups have a class is opportunity to make insurance what it really should be -- a broad-based sharing of risk. And since they are basically a non-profit organization there is no reason in the world why they should not consider every individual as one a standard risk. The Supreme Court has ruled on the "one man - one vote" issue, and we think that idea should be developed into the matter of health insurance. We realize that it is much easier to sell a large industrial plant than it is to sell each individual who may be employed in that plant. But by giving preferential rates, in addition to preferential coverages which are not available to smaller groups or individuals who are not in any group, you simply accentuate a social condition which penalizes the very segment of our society which needs the most help. (Necessity is the mother of invention, so if you can't get what is reasonably needed, you fight tooth and claw for all you can get and end up with the undesirable misuse of social legislation which crops up. We think obstinate refusal to deprive, actually creates such conditions. So stop depriving and solve it). If this is not taken care of by private enterprise it simply makes this vast number of people demand that the government do something about it. Of course, eventually government (regardless of party) becomes sensitive to this clamor.

We suggest again with all of our sincerity and with all of the weight we can that your Department again, as we have requested before, return this rate application to the Blue Cross group and tell them to send you a proposal of a single flat premium per individual for the same specific schedule of things which will be available to everybody who is a resident of the State of Pennsylvania, or covered by any policy issued by the Blue Cross.

This would show:

| | A | B | C |
|--------------------------------|------------------------|------------------------|--------------------|
| | <u>No. of Policies</u> | <u>No. of Individ.</u> | <u>\$ paid out</u> |
| policies in credible groups | | | |
| policies in noncredible groups | | | |
| policies as individuals | | | |

Totals

C divided by B equals
Premium per person

This rate would apply whether they are a single individual or whether there are included in a large group. We think if you will do this, and if Blue Cross will respond to it, that the remaining portion of the industry will have to fall in line and do the same thing. Then TOTAL EFFORT could be exerted into study and reduction of specific costs making up the average premium charge.

Now like in every other kind of insurance rate, as we have testified time and time again, there will be a loud howl because a vast army of insurance employees will fear for their jobs by such a simplification. We have said before, and we reiterate that not one single necessary employee should be eliminated. All displaced persons would be put to work getting information as to the content of the figures which make up the arithmetic which your Department is asked to examine and act on. Stop underwriting budgets - buy a medical service on a competitive basis. And we question very much, as we have on every other kind of insurance, that you actually know what the content of these figures are.

For example, we would like to suggest that you call on the Blue Cross, or undertake the examination yourself, to get a list of the major departments of the hospitals, list the names of the top specialists and their remuneration and see how many times the same identical name shows up in other hospitals and the gross remuneration in relation to the gross income of the corresponding Department.

The purpose of this is to determine the possibility of each hospital having its own complete salaried staff operating within a proper budget. We believe this idea is being explored by the University of Pennsylvania Hospital.

There has been a vast amount of discussion and testimony on mass purchasing and avoidance of duplication of equipment etc. A good bit of the duplication is due to matters of pride rather than necessity.

Another thing we wonder about and I know it was a matter of considerable conjecture at the time I was actually auditing hospitals is that many people keep asking "why is it that we are continually called on to make donations and to run various hospital benefits and the rates still keep going up and we hear so many people complain that they don't seem to get any direct benefits in reducing the cost to them". We think it would be quite a fair thing to have a proper publication of what funds are received by the hospital groups and how they are actually disbursed. Are they all used for expansion of facilities? So that C O S I S of Departments and services can reflect any part of these receipts, are they used to REDUCE the expenditures in making the cost calculation, or are they included simply in receipts where they are not reflected at all.

To my own personal knowledge the operation of the billing and reimbursement procedure of Blue Cross, Blue Shield, Medicare is cumbersome, duplicating, and very unsatisfactory. In recent years it has become so bad that I personally have been getting into arguments with my own doctors. They are no longer wont to do the paper work of reports. The system is so slow that they start asking about payment of bills (and I previously had an enviable credit standing). So I tell them I'll check up. I do, only to be informed that the system has no unpaid bills on my account. So I go back to the doctor and ask for duplicates to start all over. This is not pleasant to go through. Before I finally get things together, checks start to arrive.

Such a cumbersome system must be unnecessarily costly and have unnecessary duplications - at any rate two or more checks over the same bill before you finally get the total - that's unnecessary clerical work, and unnecessary postage and stationery and rental of VASTLY EXPENSIVE ELECTRONIC MACHINERY.

I realize Blue Cross doesn't get paid directly for trying to evolve a system, neither do we. However they have a lot to gain and the net cost to them would be exactly nothing and the net gain would be restoration of confidence in the function of Blue Cross. Or do they feel that with such confusion it provides more justification for more of their people to have a good fat job, so they don't care how much it costs. We can't afford that luxury.

Now I believe it is stated that the overhead cost load of Blue Cross is somewhere around 5%. At any rate it is a rather small percentage on the face. But as the volume goes up, does it still have to be that percentage? Can't it go down to 1%, 3%, 2%, 1 1/2% as the total receipts go up, or must it stay at some static level just to provide an expanding fund rather than a controlled fund? We think you should look into this. (We know you will need a larger staff to do so — we have already endorsed this on several occasions).

Now we have made reference in past hearings, on fire insurance for example, that we thought the insurance companies might well subsidize the matter of fire schools to train firemen so as to reduce their own fire loss outlays. We think the Blue Cross might well participate in such an idea with all other insurance plans where hospital operations are involved. Such a fund would be used UNDER A BOARD OF GOVERNORS ON WHICH THEY WOULD HAVE REPRESENTATION to educate doctors, nurses, practical nurses, medical technicians etc etc. in order to build up a work force which is now admittedly inadequate and will become much more inadequate at an alarming rate as the days go by (and I don't mean years in this connection). We think the provision of these necessary hands would cut down tremendously on the unconscionable nervous strain now placed on our very dedicated nursing staffs and the doctors themselves. We think it would be self-supporting and a good investment. We ourselves are currently involved with others in working out such a program and we hope to be able to announce something before very long.

Now as to the office appointments of Blue Cross and others, it seems to us that there is no necessity of having such a luxurious decor and quarters. It is obvious that great pride can be had in working in such surroundings, but can we afford it — do we have such things in our own homes — I don't, and there are thousands and thousands of others who do not, even in their own places of employment. Do they need a receptionist at the elevator on each floor? Thought should be given to freeing what is, and avoid a proliferation in the future. Most profit making businesses have a central receptionist who refers people to the proper floor and room number.

One of the easiest ways to get unpopular is to attack the very great luxury of hospital room care. Hospitals are heartstrings and you don't question heartstrings. Our socialites delight in the excitement of the campaigns to raise a never-ending source of funds. So we will have to be unpopular — it won't be the first time. There is no end to the ability to use all possible cash in the bottomless pit known as "Hospital Costs". There is a bottom, however, and I personally know it and will work diligently with your Department or anyone else to prove the point IF YOU WANT TO GET RESULTS AND NOT JUST COVER THINGS UP.

The cost of sleeping and eating in a hospital (without any other services at all) is greater than the most expensive hotel anywhere and a great deal has been said about the fact that people stay in hospitals longer than they need to be for recuperative purposes, at high rates — luxurious rates. (and that keeps other people out). There are some kinds of illnesses and some particular cases where the patient must remain long periods under agonizing and uncomfortable conditions. We can see the need for air-conditioning and all the rest for them. But just to lie around longer than is really necessary seems ridiculous. And I know the medical profession will be at my throat on that, but let me remind them that some of their own profession told me that.

We think the Blue Cross should be daily watching to see that hospital care does not pass the point of necessity and stop the hospital fostering this kind of thing. (Maybe the Medical Association should have a "CZAR" to watch also).

There have been many times, some of them to my personal knowledge, where hospitals put things on bills which were not rendered and simply say "well you don't pay the bill so why worry about it?". We think Blue Cross should be outspoken in this regard and it certainly has available means of detecting it. It should lead a fight against such practices. We think your Department must be aware of it and should insist on the entire insurance industry involving itself in the fight — INCLUDING EQUAL USE OF POLICIES TO ALL.

The automobile insurance group is at long last crying about unnecessary repair costs (and we think they SHOULD PAY PROPER COSTS and not try to get out of them) so Blue Cross and Blue Shield should stop being a vehicle for transferring money from sick people to hospitals and be a policeman of the costs and service.

If they don't have the right to do it, and your Department doesn't have the power to do it or ask them to do it, then we think your Department should take a forward step and get legislation to initiate it. We will back you.

Now we realize that the matter of a flat rate plan for all of the State might not be as practical as an area rate. So we again suggest, as we have in the automobile rate cases, that the same ten insurance districts we have proposed shall also be rate districts for health and accident and hospital coverage,

with a Klux Kross group for each or for any combination of such districts, but always just that particular district, unless it covers the entire State.

Now one of the great problems about this health insurance thing is the inequality of the economic structure and who pays the cost. The industry, including Klux Kross and Klux Shield, have been doing identical thinking of getting more coverage — what I believe you call the "credible groups". If you will eliminate the "credible idea" and get down to "people" I think you might solve the problem. But when you get into the large groups, you are then talking about an economic thing where the employer can put out a health and accident policy as a so-called "fringe benefit". We have remarked on this before. In some companies the entire cost is paid by them and then promptly passed on to the public as a part of the product price. So nobody except the public gets stuck and there can be no complaint. Consequently management doesn't argue and the employee doesn't argue and that's the basic thing behind what these insurance companies are doing — avoid top echelon dissent (and the low echelon suffers more and more). As a business consultant I frequently run into first hand information on the offerings and thinking. Now in some companies the employees pay a part or maybe all of the premium. But the non-group individual pays out of his own pocket always (and don't forget that the large groups have much greater benefits and the smaller groups and non-groups get boiled-down minimums. The cost is in direct reverse to the benefits).

So if the companies had to pay the same identical rate as the "man on the street" who is not in these groups there would be some kind of justice in the thing, whereas now there is no justice at all. And let me point out that on top of this there are two other benefits which aggravate the problem.

- 1 - The "Sickpay" deduction on your income tax is available to most large-group participants but not to the ordinary "man on the street" or to the self-employed. It pays some to go into the hospital and lie around.
- 2 - The "pie in the sky" multiplicity of policies which permit two and three and four recoveries for the same identical illness, makes it profitable. We have furnished copies of advertisements fostering this to your Department.

Outlawing this practice will have a stabilizing effect. Many companies will cry, of course, because of reduction of "cash intake". Many individuals, without thinking, will be at our throats because "their policies don't cover everything and the extra collection will pay for gaps". They are correct in this and the insurance companies themselves have published advertisements telling them so in positive language. We say **REQUIRE THAT A PROPER POLICY GIVING 100% of needed coverage be drawn up and sold to everybody.** That will cure the problem, and we think your Department should undertake getting it into existence.

The "little guy" is just stuck and he doesn't have a soul to defend him. We again ask for a "public defender" to fill that gap. We insist he will be of great assistance to the Insurance Commissioner by taking a lot of political pressure off of him.

People in authority do not like opposition and they like things to progress in an orderly manner so they can be praised for having conducted a very splendid program. This is understandable, and we would be the first to applaud such a thing IF IT DID NOT SIMPLY RESULT IN A CONDITION where they get the idea that "now the pressure is off, let's go golfing or have a convention in Florida or Hawaii" — at public expense, of course. They should be continually looking for the possibility of new problems arising and predetermine and start them in motion counter measures without the necessity of a public uprising.

That should be their first consideration and I frankly think that was the thinking of the InterCounty Hospital Group when it first started the idea in this area. From some things which I know Intercounty does voluntarily now, I think they still have that objective.

So we are apposed to silencing opposition and silencing expression of views. That is the worst thing that can happen to this country, when you can't have the full right to express your views. And we think the Press and the News Media and the radio and the T.V. had better stick closer to this continuing problem and stop Agnewizing the news — and that's not a political speech.

We have been told to our face that we don't have any advertising income to offer them for coverage. So a public defender might accomplish the fact and we might eventually dry up the slush fund which is making the escalation of hospital charges continue. As long as the cash is readily available, the total will be soaked up and more demanded.

We will continue our efforts and we again ask that you reject this filing.

Now I believe it is stated that the overhead cost load of Blue Cross is somewhere around 5%. At any rate it is a rather small percentage on the face. But as the volume goes up, does it still have to be that percentage? Can't it go down to 4%, 3%, 2%, 1% 1/2% as the total receipts go up, or must it stay at some static level just to provide an expending fund rather than a controlled fund? We think you should look into this. (We know you will need a larger staff to do so — we have already endorsed this on several occasions).

FRANK K. JONES
President & Chairman Executive Comm.

Hearings on Blue Cross of Greater Philadelphia, 9 A.M. 3/17, 3/18, 3/19,
1971 - Room 296 City Hall, Philadelphia.

Testimony presented for the Committee by Frank K. Jones, President

Mr. Commissioner, in accepting your invitation to testify at these hearings, we advised you that we hoped to present our own National medical service plan at this hearing. Unfortunately it is not yet ready for release. The general idea has been discussed with a good crosssection - including State and National Legislators.

We also wish to officially state to you, as we have to former Commissioners Kelly, Macowell and Reed, that we are more interested in the insurance outlook twenty years from now, after this howl and cry is over, than we are in the present turmoil. We want meaningful legislation which will prevent a recurrence of the present inexcusable debacle.

We have heretofore testified at hearings that insurance of every kind is indispensable in modern life. Unfortunately the Industry doggedly insists it is a private enterprise for profit and the newly evolved "Plans" seem intent on building lucrative private clubs rather than accomplish original purposes.

We contend that the entire Industry has been subsidizing everything without organized continuous and purposeful elimination of hazards and costs of which they were aware -- they used to deny this, but in the January February 1971 issue of the Journal of Insurance the President of one company said "Must insurance subsidize society?".

Our answer to that is, no they do not have to subsidize everything. Let a risk, imagined, actual or forecast, arise and they rush headlong into covering it with a verve.

They are now apparently intent on subsidizing the computer industry. This technology makes it practical to build up a tremendous proliferation of risk classifications which it was impossible to do with the pen and pencil. We question the cost of these procedures can be justified.

The procedure up until now has been to supply medical service to upper echelon and major employee groups at ridiculous prices because this is where social prestige and political influence is concentrated which could upset their "private club tranquility". Now the industry has responded to the inevitable

public outcry by coming into the open with its avowed political activity. Previously the activity was just as real but was carried on underground.

There is an apparent intent to deprive full equal service to those who most need it -- probably to force an outcry and force the Government to take over that section of insurance (in each classification) which the industry prefers not to cover. This would then leave them with the "best cows to be milked".

Already the Government is speaking of a \$50 per month family charge for all hospital and medical attention. That is \$600 per year and is based on the presently established mad hog wallow price structure, which simply **MUST NOT CONTINUE**. It means that most low income people will have to be on the relief rolls and the rest of us pay the cost on top of a deliberately engineered ridiculous cost. The only ones to benefit would be the Medical/Insurance family. It will kill the dignity of man and bring on total socialized medicine.

We introduced in evidence at one hearing of the Department the brochure of one nursing home group in its stock offer, stating that it was anticipated to receive a substantial return from Medicare services. The charges of that home could only be met by affluent people, but at the same time, would milk money from the Medicare funds which were needed to take care of less pretentious services to less affluent folk.

On the other hand, our own Committee's plan will give reasonable medical attention without the ridiculous schedule of charges.

ADVERTISING CAMPAIGNS induce gross inequities and high costs. We hand you, as we have handed other Commissioners, some advertising material of recent date -- mail, stuffer, fullpage newspaper. You should gump on this kind of thing with both feet right now and stop it. We have asked this action time and time again without success. It is the root of the insurance evil. We know of at least one newspaper editor who will not accept such advertising because he thinks it is not "good for his subscribers". (don't try to guess which editor -- you would be entirely wrong -- this particular paper has never printed any of our releases.

The advertising of wild-eyed offerings of vast wealth creates the hog wallow in which the hospitals and medical men, as well as the insurance companies revel. It makes the "Ready Cash" props.

The availability of cash is the basis on which medical charges are based at every level -- doctor, hospital, insurance policy etc. Years ago when Abington Hospital initiated the Intercounty Hospital Plan, it was the first in the Phila. area. I was on the hospital auditing staff of a prominent Public Accounting Firm at the time. The industrialists on the Board of directors of one hospital asked if they should join the plan. We told them they should, since it would mean they could collect their accounts receivable -- and without a pause one member of the Board said "Yes and we can increase our rates".

Our suggested remedy to this is to stabilize the industry and medical services by forming a Federal Authority of a "Hoy'd of London" type to license all insurance companies. The Authority would have a subdivision Federal Health Insurance Pool finance by assessments on all insurance companies to control the operating matters. The Main authority would be the "Reinsurance and High Risk pool".

We believe the Insurance Industry Family could do much themselves to stabilize things and start getting insurance back on proper track. They could have a self-appointed CZAR who could certainly have secured results equal to those obtained in sports. One of the highlights of our efforts was the many conferences we had with J. Harry La Brum. The sincerity and objectiveness of this man was so great that we suggested he be named the CZAR of the industry in our testimony and elsewhere. He could have done a job which the Public would have applauded. He had a desire to solve things and we learned from his lips some of the things which even he refused to condone on the Industry side of the fence.

But when we made our initial suggestion back in Commissioner Kelly's days, the published reaction of the Industry, through its official public relations arm, was that "they trembled at the thought of a CZAR -- it would destroy competition".

We believe that our suggest F.H.I.P. setup will bolster weaker elements of the entire medical system, would do much to reduce costs, provide personnel and permit a more uniform quality of medical care

throughout the United States. This coupled to a transportation grid would permit facilities to be established in underdeveloped areas and have them ready when the area is developed -- in the meantime they would bolster to built-up areas. It would have other advantages covered by our plan.

DONATED FUNDS -

Now medical attention is one thing everybody is vitally interested in. It is one of the heartstrings of America. That is the reason the many laudable fund appeals find the public rising to the call to carry on research, build hospitals, help hospitals with operating costs, and assist the less fortunate with medical services.

It is therefore downright frustrating and alarming to face the situation where you, yourself, are in need of the things you contributed to help time and time again, only to find that you are financially unable to obtain them -- unless, of course, you are willing to pour your substance into the new of medical practice, become a pauper and then qualify.

A thorough siring of just what happens to all the funds collected, should be undertaken -- it would have a salutary result. I know during my own auditing experience we were continually requiring funds be removed from expansion programs and placed into operating funds where the public was led to believe they would be used. Our Committee can inform you of the deliberate squandering of money on a hospital construction -- in fact we can show you the thing in motion pictures.

IMPORTANCE OF MEDICAL INSURANCE - In our opinion this coverage is the most important of the entire field -- it also affects the majority of other forms of insurance, especially automobile insurance. We find that Life Insurance Companies (in direct statements to us by top officials) are not concerned with highway deaths "because they are so few in relation to the total claims". We also fail to detect any great movement on the part of the Automobile Casualty people to reduce their claims by better medical costs. They are only very recently getting into car design and road hazards -- a very late start in attitude from plain "subsidizing".

One of the reasons the companies (including Blue Cross) are short of funds is that in their individual company scramble for the market (they insist it is a losing market) have pushed a policy which is not needed (thus forcing a need). As one company comes out with one idea, the others strive to surpass it, at the same price or better -- then demand rate increases to cover up. In doing this they leave holes in coverage, necessitating purchase of other policies. A classic instance is the problem of the elderly. Medicare, must be augmented by 65 special and other forms. By this time one single policy should be in existence to take the worry and uncertainty out of the minds of our senior citizens. Your Department should ride herd until such a policy is obtainable at reasonable rates.

SPECIAL POLICIES AND RATES:

We are mindful of the very favorable rates available to some organizations and groups (particularly the news and broadcasting media). Some of these are policies sold by commercial companies and some are self-insuring policies. However, what is available to some can certainly be made available to all on a much nearly equal basis than at present. If you will collect this information and publicize it as to rates and coverages (without mentioning names, of course) you could very well break the Gordian Knot.

A publication of this sort could be the Bible of the Consumer in knowing what he should be able to get in insurance. With this criteria available to the customer, the companies would be held in control and still have room for legitimate competition. Many people come to us asking "What is a Good Company and what is a good policy" -- we wish we could answer that one.

PIRATING - In my own capacity as a Consultant to Small Businesses, I find my own clients being dogged by insurance representatives to leave their present insurance company and come with another with greatly expanded benefits at very little additional cost and in some instances at even less cost.

Now the worst part of that procedure, as we have testified to this Department time and time again, is that most of the large group plans are already, or are rapidly becoming, "fringe benefits". The employee pays nothing and the total cost is passed on to the consumer, plus overhead, in sales price.

The employer isn't hurt, the employee is pleased, and the insurance company has insufficient funds. There is then that sudden sinking feeling in the stomach of any individual leaving the group by retirement or other cause and becoming conscious of what was being done behind his back as he now digs into his own pocket.

The ideal thing would be for every individual to pay for insurance. If this were so, the outcry from the streets would be many fold worse than it is.

That not being possible, we think the next thing is to strive to get as closely as possible to where the cost per subscriber (regardless of who pays the bill) is almost identical for the same service or coverage, and regardless of size of group he is in.

We have asked before and just for your own information (even if you use it as a way to prove that we are wrong in our viewpoint), we would like to see you compile the following:

Credible groups

Total persons in largest five classes, medium five classes, smallest five.

The coverage accorded to each of these

The premiums for each of these

divide the above into categories

(a) employer pays entire premium

(b) employer pays part premium

(c) employee pays entire premium (employer pays nothing)

Total claims paid out in each category

UNCREDIBLE GROUPS get same information

HOW GROUP INDIVIDUALS get same information

Now divide the number of individuals into the claims paid, to get the average per person. Then add the whole mess together and divide by total people covered and see how that average figure compares.

Then determine how much electronic equipment, how many highcost rentals and other overheads can be eliminated from the administrative costs. We think with this kind of arithmetic you can get a more equitable premium.

Oh yes, that brings a howl from the employees laid off — but they aren't laid off — they go to work (as we testified before) on wadding out unwarranted service charges, overcharges, unnecessary things and MISFEITS. That will pay their entire salaries and leave a very large plus to further reduce the premiums.

Another advantage to be gained is that your own Department would have a filing presented to you which could be understood. We contend that the very immensity of the current system of fragmented rates and classifications makes it impossible for you to keep up with it. They have more "fire power" with their total computer equipment than you have with yours. And when you merge a lot of statistics from many companies and file jointly through a Rating Bureau, you might as well take the figures from a calendar. As an auditor, I would hate to certify to such figures. How can you possibly know how many trade association costs, how many lunch conventions at vacation spots, how much high rental to insurance industry satellites, what poorly allocated salaries etc etc are included?

BASIC POLICIES - We think that your Department (or the suggested PHIP) should draw up "minimum policies" which every company must market in order to be given a license to operate in any State. The face of the policy should show that basic premium and a schedule of possible rider additions that can be had. The premium of each rider should be sufficient to cover that rider and not be a bonus as is now done. And the riders should carry a lions share of the "plant cost" of the hospitals etc.

You attached a copy of your ten suggestions of areas for improving the present situation. The following are our direct comments on these items and we will cover as many of them as our assigned time permits. We ask that all items not covered be entered on the record as if we had covered them.

- 1 a - A very serious study and prompt solution of this matter of reimbursement methods must be made. The present paper work (which is not standard as to all companies) which is generated even retards the reimbursement and causes avoidable heavy expense both to the hospital, the medical man, and Hine Cross. The simplification of the policy coverage will eliminate a vast amount of the cost and confusion.
- c - Fostering of group practice prepayment plans. We are opposed to the continuation of stress on group coverage. The benefit gap between various group sizes and individuals, not only causes tremendous costs in record keeping, but is contrary to the concept of insurance, which is the sharing of risk by the many.
- d - Depreciation is in effect a deferred maintenance charge. Proper current

throughout the United States. This coupled to a transportation grid would permit facilities to be established in underdeveloped areas and have them ready when the area is developed -- in the meantime they would bolster to built-up areas. It would have other advantages covered by our plan.

BASIC POLICIES - We think that your Department (or the suggested FHIP) should draw up "minimum policies" which every company must market in order to be given a license to operate in any State. The face of the policy should show that basic premium and a schedule of possible rider additions that can be had. The premium of each rider should be sufficient to cover that rider and not be a bonus as is now done. And the riders should carry a lions share of the "plant cost" of the hospitals etc.

You attached a copy of your ten suggestions of stress for improving the present situation. The following are our direct comments on these items and we will cover as many of them as our assigned time permits. We ask that all items not covered be entered on the record as if we had covered them.

- I a - A very serious study and prompt solution of this matter of reimbursement methods must be made. The present paper work (which is not standard as to all companies) which is generated even retards the reimbursement and causes avoidable heavy expense both to the hospital, the medical man, and Blue Cross. The simplification of the policy coverage will eliminate a vast amount of the cost and confusion.
- c - Fostering of group practice prepayment plans. We are opposed to the continuation of stress on group coverage. The benefit gap between various group sizes and individuals, not only causes tremendous costs in record keeping, but is contrary to the concept of insurance, which is the sharing of risk by the many.
- d - Depreciation is in effect a deferred maintenance charge. Proper current

maintenance should restore depreciation wastage. Rather than accelerate Depreciation, we think building depreciation and major equipment depreciation should be adjusted downward to some extent by the actual cash maintenance expenditures each month. Many hospitals are built and equipped by donated cash and the total replacement in all probability will be done with donated cash.

- f - Reimbursement of low utilization facilities. The FHIP we suggest might well work out with various areahospitals just what facilities are needed. Then instead of each hospital being in total competition with each other, they would be in total cooperation with each other in rendering a full broadbased medical service. Not every hospital would have the identical facilities, but each ~~area~~ area would have what is needed, available to patients of any hospital. (In this connection our Committee's suggestion of ten insurance districts in Pennsylvania might produce the basis for determining area hospital equipment). Some excess standby facilities must be available and might well be subsidized by FHIP.

Open heart surgery is becoming a much used benefit. We think there must be a special study made as to how this can be made available at better cost to those who are not covered by the deluxe hospital plans. In low utilization hospitals, the cost should be equalized by FHIP or the patient should be assigned (along with his own doctor even if not accredited to that hospital) to a hospital which is designated in that area for such service.

- j - Bad debts should be eliminated entirely from costs. There should be an interhospital fund set up to reimburse themselves for bad debts. The agency supervising this reimbursement should conduct a hard-nosed audit of what charges are on bad debt accounts to see if the very improper nature (such as unrendered services) charges might be the cause of the bad debt and refuse to reimburse that loss. This would be a self-policing of improper charging and unnecessary services.

Research costs should not be reimbursed. There are ample funds donated for such things and these funds can be obtained. This does not, of course, mean the normal laboratory tests -- it refers just to longterm exploratory research which is using the hospital equipment and patients as a ready laboratory in place of establishing an self-contained commercial enterprise elsewhere.

- 2 a - The State should be divided into Insurance Districts (ten of them). Each district could then also be a Hospital Utilization district. The object would be (under FHIP) to endeavor to spread out the various facilities so as to obtain maximum utilization. Then the individual utilization would be a lot more meaningful for rate study.
- c - Some reasonable guideline of required hospital stays should be worked out. We think this again should be done by FHIP, in cooperation with the medical profession (We are not questioning the dedication of the medical profession -- we are proud of them -- but the present escalation of costs has even them rocking on the ropes. In our opinion "recuperation and rehabilitation" joint facilities would have a major effect on this problem.
- d - Not much use debating this -- disallow it in one place and it would be buried skillfully in another. A proper "hardnosed policing" of hospital bills will go a long way to correcting the matter.
- 3 a - Disclosure of Blue Cross/Hospital contracts. Since Federal and State funds are permanently locked into payment of hospital bills, the private contracts should be a matter of record in the Insurance Department where proper committees from the Legislators could examine them. It is correct that the Insurance Department should keep well abreast of such contracts.

This is needed to keep the lid on radical medical cost increases just to make a high-level professional income for some at the expense of the public.

- b - We question the desirability of advising patients the cost of the services shown on their bills. We doubt if the vast majority of the patients would know what it was all about and might suffer a heart attack trying to work it out. In addition the cost of doing such a thing would be indefensible.

- 3 b However, we do think that every bill should have on it a prominent footnote "If the patient has any question as to any charge hereon, particularly as to whether the service was rendered, he has the right to refer the matter to the Penna. Insurance Department in Harrisburg, Pa."

Such a note would help greatly in breaking up those improper charges because "you don't pay the bill, so why worry".

- c With the Insurance Department and other proper Government agencies watching the interests of the public as well as the hospitals, it is hoped that there would be a minimum of things the public should watch. It is desirable that the hospitals be spared the tremendous cost of making airrads of unneeded "whim reports". A simplified medical coverage will release hundreds of hands to do necessary medical operating things which are now not done or inadequately done. This, in itself, should further cut down on costs.
- d Cost of per diem charges by hospitals should be publicized twice a year, particularly to the Legislators. We recommend that this be on the basis of the Insurance Districts previously mentioned for ready comparison. Then the Insurance Department in cooperation with the suggest FHIP should delve into the reasons for the discrepancies and endeavor to minimize them, knowing full well that you just can't get equal costs in every unit.
- e Not only should there be a disclosure of payments to such specialists who are not on a fixed annual salary and on the fulltime staff, but the matter of supplying sufficient help should be the function of the suggested FHIP. In my own experience, an anesthesiologist was billed by the hospital and the same technician sent an additional personal bill because the hospital scale was not high enough.

We do not question adequate pay for medical experts and technicians but we think their own associations should set some reasonable guide lines

At the last Blue Cross hearings in Phila, we and others suggested that your Department obtain lists of everybody receiving over \$10,000 per year, especially the technologists and then crosscheck each list to locate the same name appearing on more than one hospital list — I know, professionally, that such things did occur and presume that they still do. A little light could have a great effect in reducing costs. (Our own plan, when released will chart the way.)

- 5 c We recommend that something be done along the lines of having standard hospital plans drawn up for buildings, allowing for expansion. The facilities would then be more familiar to changing personnel and save much in construction and operating costs. This is mostly adaptable to new construction in open rural areas where the maximum load is still in the future. It permits those rural units to better function as standby and auxiliary facilities for urban plants, especially during crisis.
- 6 b Duplication of benefits, and/or duplication of reimbursements should be prohibited (as suggested in our remarks on advertising). Since such duplications are based on the premise that some policies do not cover certain items, it is imperative that the policies offered to the public must be strictly regulated so the consumer is not faced with a bewildering mass. This clarification of policies will, in itself, vastly cut down on the paper work and operating costs of even the insurance companies themselves, as well as hospitals.
- c This point is covered by our prior remarks asking for basic minimums which cover MUSTS, plus riders covering non-essentials at additional adequate premium.
- 7 a The matter of pre-admission testing and usage of outpatient care must be a matter to be supervised by an agency such as FHIP so as to gradually circumvent the unnecessary hospital entrance and length of stay and the services used on admittance. In other words, medical practice should again revert to a service and not to expand further into a research effort. Such control must be monitored by a meaningful department of FHIP.

- 7 f Looking to the eventual (and obviously unavoidable) nationalization of medical attention at all levels - it is imperative that all account and reporting forms (ALL PAPER WORK) become uniform as promptly as possible. Those who are opposed to nationalization should be the loudest in calling for this standardization because it will permit proper comparisons which are impossible now. The present confusion precludes fair evaluation of either to the medical community or to the public.

- 8 a The public has only recently become aware of the fact that the Blue Cross organizations are under the control of the medical community. The Board should be service oriented, certainly not a political football, nor a medical/insurance company bonanza. Possibly only by area or state board supervision (FHIP) can such broad principles be attained. Otherwise it can be ego/competitive.

Blue Cross must be, what it started to be, a purchasing agency for the public. There is even frailty in that concept, however, in industry.

Until very recently, at least, Blue Cross has resisted public information. We bring to your attention our testimony in the hearings on Blue Cross in Phila. on April 16-17-18, 1970. We ask you to review that testimony and make it a part of the record of this hearing. In that we reported the downright arrogance of the Blue Cross officials in refusing to let us have access to papers on the filing. Following that hearing, we were given the courtesy of talking to those who should have been available without the unpleasantness. We think the entire medical community and the Blue Cross (the same as insurance companies in other fields) is engaged in "pulling the wool" over the eyes of the Insurance Commissioner for the benefit of others than the public. Up until now the mark on their faces has been even visible -- we find the mark has been gradually disappearing, but the intent remains obvious. We for our part, will continue to fight.

- b We believe there should always be a consumer representative on all boards such as Blue Cross. Consumer groups themselves are not enough. There is no communication between consumer groups either and that is a calamity. Do not for a minute think that whereas Blue Cross started consumer oriented and became a desirable employment haven to be protected, that consumer groups cannot become the same. We hope your office will forever hold public hearings on rate increases to avoid the quiet "job pools" perpetuating.
- c We think that not only all Blue Cross subscribers, but that every other policyholder of every other type of Insurance should receive notice of requests for rate adjustments, plus notification of availability of appeal for help from the Insurance Commissioner, plus notification of the Insurance Commissioner by the Insurance Company/and or plan of each and every cancellation, refusal to renew, or refusal to sell.

We do not believe that either the public or the Insurance Commissioner is fully aware of what is going on. In fact, we note that you, Mr. Commissioner are asking for 50,000 policyholders to enter protests in automobile insurance. If what we have been asking for eight long years had been done (and we repeat that request above) you would have that 50,000 plus some 100,000 more protests right now. We will ask legislation on this particular point this year.

- d Yes, most decidedly policyholders should be advised of hearings. Just start this kind of notification and the number of requests will subside to what is really required and stop the "fat-oil-living" of insurance people.
- e We believe that if special T.V. forums were arranged at least once a year, or that some portion of the annual meeting of Blue Cross would be televised (like school board meetings etc). that people would become more interested because they would be better informed. At present most are simply disgusted and don't trust anything including Blue Cross and the Insurance Department itself.

It would also be meaningful if the Press (I mean a joint press-club) would hold televised interviews - excluding politicians and get down to earth discussion and debate at the people level.

STATEMENT OF H. C. THOMPSON, PRESIDENT, AND JOHN HUENNEBACH, EXECUTIVE
DIRECTOR, NATIONAL CONGRESS OF PETROLEUM RETAILERS

The National Congress of Petroleum Retailers supports most of the provisions of S. 976. Auto safety, the cost and efficacy of automobile repairs, the high cost of automobile insurance are issues in which our 75,000 gasoline retailer members have a vital interest. We deal face-to-face with the consumer on a day-to-day basis. We must, therefore, equate our self-interest with the consumer interest.

We believe, however, that certain aspects of Section 501(a)(2) of this bill run counter to such interests. As written, it would adversely affect approximately 60,000 retail gasoline dealers. These dealers are certified as vehicle inspectors under various State inspection programs. They have done this job well and in the best interest of the motoring public. This Section would wipe out their investments and operations. Yet, there is little likelihood that a better system would result.

Certainly, we agree with the need for a national and uniform motor vehicle inspection program. But, before State *supervised* inspection is eliminated in favor of a State *operated* system, we believe there should be substantial evidence that such a change will, in fact, benefit the motorist. Such evidence presently does not exist.

Indeed, there is evidence to the contrary. Pennsylvania, for instance, has perhaps the finest inspection law in the country and statistics have shown the beneficial effect it has had in creating safety on Pennsylvania highways. Citizens in other States deserve a system at least as effective.

However, Pennsylvania does not operate its own inspection system. Inspection stations in Pennsylvania are licensed and these stations themselves are inspected by the State Police. If a car owner feels aggrieved, he can complain to the authorities and if the complaint is found to be valid, the inspection station can lose its license.

In our opinion, a good nationwide periodic motor vehicle inspection act requiring inspections at least twice a year, makes good sense. However, a State, if it desires, should be free to utilize private facilities. Such facilities can be required to use qualified, certified mechanics licensed to do this work.

A private system saves the State the expense of building and equipping State inspection stations. It keeps manpower, such as trained, skilled mechanics from being drained from present repair shops where there is already a shortage. The inconvenience, cost and time involved when a car owner has to deal with the State monopoly may be far greater than through the utilization of private licensed inspection stations.

We submit that the most efficient and effective way to handle this problem is to utilize the private inspection system but under stringent State supervision. Both large fines and the revocation of licenses should be effective sanctions if it appears that the facility is not treating the consumer fairly.

We support tough State standards, adequate policing and licensing procedures. The public is entitled to no less.

But, we also believe our dealers are entitled to operate, as various States have licensed us to do, so long as we continue to operate with high standards. As long as private enterprise is demonstrating that it can do the job well, this method of operation should be available to the States if they desire to use it.

We ask only that we be judged on our performance. To date, that performance has operated in the best interest of the motoring public. Certainly, 60,000 dealers should not be legislated out of their investments and operations, unless strong evidence exists that there will be commensurate benefits to the consumer.

Presently, the evidence is to the contrary. It indicates that private inspection under stiff State licensing procedures is an excellent method of insuring safer highways.

We respectfully request, therefore, that Section 501(a)(2) be struck from the bill or otherwise altered to meet the objections raised in this statement.

STATEMENT OF CLARK E. FEGRAUS, PRESIDENT, AND M. VAN LOAN, VICE PRESIDENT,
AUTOMOTIVE ENVIRONMENTAL SYSTEMS, INC. SAN BERNARDINO, CALIF.

Automotive Environmental Systems, Inc. is pleased to have this opportunity to present our views on S. 976 as introduced by Senator Philip A. Hart and Amendment No. 67 submitted by Senator Ribicoff. Our comments will be confined to the subject of Diagnostic Inspections for safety and pollution.

The Subcommittee on Antitrust and Monopoly in a thorough investigation of automobile repairs, received thousands of letters from citizens concerned about their automobile, its repair problems and its maintenance and repair costs. We too, in our capacity as engineers and consultants in the field of automotive air pollution and safety, have received similar comments from the consumer. We have compiled and digested considerable literature on this subject, and have thoroughly investigated various schemes for vehicle safety and pollution inspection. Following are observations which we have made during recent years which are technically supported and which are highly pertinent to the proposed "Motor Vehicle Information and Cost Savings Act".

The consumer is generally unaware of the numerous safety problems that exist in his automobile. Studies by diagnostic centers and the Missouri Automobile Club indicate that the vast majority of cars on the road have potential safety defects. The number of actual safety defects is far less but still is a significant fraction. The contribution of these unsafe vehicle to the accident and mortality rate on our highways is not accurately known, but whatever this contribution, it is too much.

The consumer is unaware that the daily operation of his vehicle is costing him far more than it should because the engine is not operating efficiently or the transmission and brakes are improperly adjusted. Surveys show that the consumer feels that tuneups are too inconvenient, that a tuneup is too expensive or that their car is running properly. In addition, a majority of consumers rate their tuneup service good or excellent. However, a tuneup performed on the average car will cause a reduction in fuel consumption of 5-10% and an increase in power of about 10%. These figures may be considerably higher on older or poorly maintained cars. The irony here is that those consumers who can least afford a proper tuneup can least afford to waste gasoline.

The consumer is not generally aware that his automobile is a major source of air pollution in the United States, and is even less aware of pollution causing defects in his vehicle. Numerous studies by industry, states and the Federal government have indicated that vehicles emit far more pollutants than need be emitted. Vehicles which have been digested to meet low pollution standards deteriorate with use in the hands of the consumer. Because low pollution from vehicles is so intimately tied to proper engine operation, the normal lack of maintenance causes a severe increase in pollutants. For example, a misfiring spark plug can cause a 300-1000% increase in hydrocarbon emission levels. Improper idle mixture settings can cause a 50-200% increase in carbon monoxide emissions. A dirty air cleaner or improperly adjusted choke can cause a 50-200% increase in carbon monoxide and hydrocarbons. Improperly adjusted carburetion and spark timing can also cause great increases in oxides of nitrogen.

People are susceptible to sales efforts by mechanics or car salesmen. There is no attempt by the consumer to ascertain the vehicle's actual condition. Frequently the consumer has no place to turn to verify the safety, operational or emissions performance of his car.

Automobiles are becoming much more complex, as the consumer requires many power accessories, greater performance, larger automobiles; and as the government establishes safety and pollution standards. The average repairman or mechanic can not keep up with the latest information available about all aspects of all cars, and therefore certain aspects of repair or service do not get accomplished properly. Another reason for a lack of proper automotive service and repair is that the number of vehicles on our highways is increasing at a rate far greater than the number of mechanics and service facilities.

The foregoing observations serve to strongly uphold the urgent need for legislation such as S. 976 and Amendment No. 67. We view the diagnostic inspection system proposed in this bill as a potential incentive to the consumer to take better care of his vehicle and not as a government edict. The bill offers incentive to the manufacturers to consider maintenance and repair of safety, operational and pollution items in the design of new cars. It offers incentive to the service industry to upgrade and do a proper job.

An independent diagnostic inspection system would, if properly implemented on a periodic basis by states, provide the consumer with an unbiased evaluation of his vehicle. He could decide whether to repair it or to buy another; he could be assured of a vehicle's condition before purchase; and he would be guaranteed that after damage his car would be safe.

Periodic diagnostic inspections are essential to effective vehicle pollution control and vehicle safety because:

Many people will defer needed repairs as long as possible unless they are compelled to correct deficiencies determined by inspection.

Conversely, many people will strive to upgrade their vehicles in anticipation of inspection, if the inspection is generally accepted to be effective and thorough.

Many pollution and safety related deficiencies develop gradually and the motorist is often unaware of their existence. Only by suitable inspection are such deficiencies likely to be determined.

The information and data that may be derived from vehicle inspections will be extremely valuable in pinpointing automotive service problem areas, as well as developing ongoing controls.

Periodic motor vehicle inspections of a diagnostic type may serve as an important measure in reducing automotive service costs by diagnosing vehicle ills more accurately.

We at Automotive Environmental Systems, Inc are very concerned that diagnostic inspections *per se* will be construed by many, as the solution to our vehicle repair, safety and pollution problems. Diagnostic inspection is not the solution, but an important means to effect or induce the solution. The true solution is, of course, accurate, honest and economical automotive service. If this bill or any vehicle safety or pollution control measures are to be effective, a major change in the profile of the automotive service industry is essential.

Regardless of how clean and safe new cars are, new cars become used cars as soon as they are driven home by the proud purchasers. All vehicle systems, including safety and pollution control systems, deteriorate with time and use, and will continue to do so for the foreseeable future. Unless these systems are properly maintained, vehicle pollution and vehicle safety will continue to be serious national problems.

Periodic diagnostic inspections will involve the use of procedures and equipment with varying degrees of sophistication. If deficiencies determined during inspection are to be corrected properly, the procedures and equipment at the service facility must be at least equivalent in sophistication.

New cars are safer and "cleaner," from a pollution standpoint. However, they are more complex and require more precise tuning and adjustment. Furthermore, this trend will continue and intensify in the next few years. Accordingly, automotive technicians must be better trained and capable of using new and more sophisticated equipment and procedures.

As has been emphasized in last year's hearings by the Senate Subcommittee on Antitrust and Monopoly concerning the automotive service industry, there is a serious and growing shortage of qualified automotive service personnel. If the vehicle safety and pollution challenges of the 1970's are to be met successfully, this problem must be solved through new concepts in recruiting and training. New Federally sponsored employment and training programs should be directed to this end.

Depending upon the stringency of inspection standards set, a dramatic increase in workload for the automotive service industry can occur with the inception of periodic inspections. This will further aggravate the problem of personnel shortage previously mentioned.

In conclusion, our experience has convinced us that periodic motor vehicle inspection, together with a major upgrading and expansion of the automotive service industry, are absolutely essential for vehicle pollution control and improved vehicle safety. Any actions, such as S. 976 and the amendment which will promote these measures, are urgently needed.

STATEMENT OF CHARLES L. RUE, OPOU, CHAIRMAN, NATIONAL AFFAIRS COMMITTEE
INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATION OF NEW YORK, NEW
JERSEY AND CONNECTICUT

PURPOSE

This statement is submitted in lieu of verbal testimony to outline the position of the Independent Mutual Insurance Agents Associations of New York, New Jersey and Connecticut relative to HR-4994 in particular and the concept of "first party" or "no fault" automobile insurance in general. These associations represent a total of approximately 3,500 independent insurance agencies and 10,000 insureds.

ual agents. We respectfully request that this document be entered in the record of the current hearings on HR-4994.

POSITION ON FIRST PARTY REPARATIONS SYSTEM

These three associations, individually and collectively, strongly support the concept of a first party automobile accident reparations system, commonly referred to as a "no fault" system. This position stems from an intensive study of accident reparations initiated by our own three-state Auto Study Committee in 1967, the findings of which were published in September of 1968 and can be provided upon request.

Although we have not proposed and do not contemplate proposing a specific reparations plan of our own, our ultimate objective is a pure no fault system. At this time, however, we are prepared to support any limited or hybrid plan which represents an intelligent evolutionary step in that direction.

OBJECTION TO TORT SYSTEM

Our objections to the present tort liability system may be summarized as follows:

1. Claim settlements have tended to be painfully slow, with delays of anywhere from several months to several years remaining commonplace in the case of large claims associated with serious accidents.
2. Many accident victims presently receive no compensation for their losses, perhaps because of some insignificant degree of contributory negligence. Similarly, many are grossly underpaid for their losses.
3. A significant portion of many tort settlements is diverted to court costs and legal fees, never reaching the accident victim.
4. The tort system appears to have created serious court congestion.
5. Fault itself, the basis of the tort system, is extremely difficult to prove in many cases and impossible to prove in some.
6. The process of proving fault generates high investigation costs for the insurance companies involved.
7. Finally—despite its supposedly punitive nature, the tort system has apparently done little to reduce our disgraceful highway accident rate or remove chronic offenders from the road.

ADVANTAGES OF FIRST PARTY SYSTEM

Our studies lead us to believe that at least five major advantages would accrue from a first party system:

1. It would result in faster claim settlement. This is a decisive factor in the immediate aftermath of serious accidents, when medical and/or repairs bills accumulate most rapidly, when victims most frequently find themselves confronted with financial crisis and when funds are urgently needed for rehabilitation of seriously-injured persons.
2. It would lead to more equitable settlements, with every accident victim receiving reasonable compensation for his losses and a smaller portion of any settlement being eroded by litigation costs.
3. The direct buyer-seller relationship between the insured person and his insurance company would probably minimize the tendency of some companies to resist all claim settlements, even those which are clearly justified.
4. It would probably reduce court congestion.
5. It would eliminate the costly and difficult problem of proving fault before compensating the accident victim.

MINIMUM REQUIREMENTS

We consider the following to be the minimum requirements for any acceptable first party reparations plan:

1. It must place the automobile insurance in a primary coverage position (See subsequent comments).
2. Mandatory coverage—whether pure first party or some combination of first party and tort rights—must be high enough to insure reasonable repayment and rehabilitation of the accident victim and prevent his becoming a public charge.
3. It must offer sufficient first party protection to cover costs which might reasonably be anticipated in the immediate aftermath of an accident.

throughout the United States. This coupled to a transportation grid would permit facilities to be established in underdeveloped areas and have them ready when the area is developed — in the meantime they would bolster to built-up areas. It would have other advantages covered by our plan.

DONATED FUNDS -

Now medical attention is one thing everybody is vitally interested in. It is one of the heartstrings of America. That is the reason the many laudable fund appeals find the public rising to the call to carry on research, build hospitals, help hospitals with operating costs, and assist the less fortunate with medical services.

It is therefore downright frustrating and alarming to face the situation where you, yourself, are in need of the things you contributed to help time and time again, only to find that you are financially unable to obtain them — unless, of course, you are willing to pour your substance into the new of medical practice, become a pauper and then qualify.

A thorough airing of just what happens to all the funds collected, should be undertaken — it would have a salutary result. I know during my own auditing experience we were continually requiring funds be removed from expansion programs and placed into operating funds where the public was led to believe they would be used. Our Committee can inform you of the deliberate squandering of money on a hospital construction — in fact we can show you the thing in motion pictures.

IMPORTANCE OF MEDICAL INSURANCE - In our opinion this coverage is the most important of the entire field — it also affects the majority of other forms of insurance, especially automobile insurance. We find that Life Insurance Companies (in direct statements to us by top officials) are not concerned with highway deaths "because they are so few in relation to the total claims". We also fail to detect any great movement on the part of the Automobile Casualty people to reduce their claims by better medical costs. They are only very recently getting into car design and road hazards — a very late start in attitude from plain "subsidizing".

One of the reasons the companies (including Blue Cross) are short of funds is that in their individual company scramble for the market (they insist it is a losing market) have pushed a policy which is not needed (thus forcing a need). As one company comes out with one idea, the others strive to surpass it, at the same price or better — then demand rate increases to cover up. In doing this they leave holes in coverages, necessitating purchases of other policies. A classic instance is the problem of the elderly. Medicare, must be augmented by 65 special and other forms. By this time one single policy should be in existence to take the worry and uncertainty out of the minds of our senior citizens. Your Department should ride hard until such a policy is obtainable at reasonable rates.

SPECIAL POLICIES AND RATES:

We are mindful of the very favorable rates available to some organizations and groups (particularly the news and broadcasting media). Some of these are policies sold by commercial companies and some are self-insuring policies. However, what is available to some can certainly be made available to all on a much nearly equal basis than at present. If you will collect this information and publicize it as to rates and coverages (without mentioning names, of course) you could very well break the Gordian Knot.

A publication of this sort could be the Bible of the Consumer in knowing what he should be able to get in insurance. With this criteria available to the customer, the companies would be held in control and still have room for legitimate competition. Many people come to us asking "What is a Good Company and what is a good policy" — we wish we could answer that one.

PIRATING - In my own capacity as a Consultant to Small Businesses, I find my own clients being dogged by insurance representatives to leave their present insurance company and come with another with greatly expanded benefits at very little additional cost and in some instances at even less cost.

Now the worst part of that procedure, as we have testified to this Department time and time again, is that most of the large group plans are already, or are rapidly becoming, "fringe benefits". The employee pays nothing and the total cost is passed on to the consumer, plus overhead, in sales price.

The employer isn't hurt, the employee is pleased, and the insurance company has insufficient funds. There is then that sudden sinking feeling in the stomach of any individual leaving the group by retirement or other cause and becoming conscious of what was being done behind his back as he now digs into his own pocket.

The ideal thing would be for every individual to pay for insurance. If this were so, the outcry from the streets would be many fold worse than it is.

That not being possible, we think the next thing is to strive to get as closely as possible to where the cost per subscriber (regardless of who pays the bill) is almost identical for the same service or coverage, and regardless of size of group he is in.

We have asked before and just for your own information (even if you use it as a way to prove that we are wrong in our viewpoint), we would like to see you compile the following:

Credible groups

total persons in largest five classes, median fire classes, smallest five.

The coverages accorded to each of these

The premiums for each of these

divide the above into categories

(a) employer pays entire premium

(b) employer pays part premium

(c) employee pays entire premium (employer pays nothing)

Total claims paid out in each category

NON CREDIBLE GROUPS get same information

NON GROUP INDIVIDUALS get same information

Now divide the number of individuals into the claims paid, to get the average per person. Then add the whole mess together and divide by total people covered and see how that average figure compares.

Then determine how much electronic equipment, how many highcost rentals and other overheads can be eliminated from the administrative costs. We think with this kind of arithmetic you can get a more equitable premium.

Oh yes, that brings a howl from the employees layed off — but they aren't layed off — they go to work (as we testified before) on weeding out unrendered service charges, overcharges, unnecessary things and HAZARDS. That will pay their entire salaries and leave a very large plum to further reduce the premiums.

Another advantage to be gained is that your own Department would have a filing presented to you which could be understood. We contend that the very immensity of the current system of fragmented rates and classifications makes it impossible for you to keep up with it. They have more "fire power" with their total computer equipment than you have with yours. And when you merge a lot of statistics from many companies and file jointly through a Rating Bureau, you might as well take the figures from a calendar. As an auditor, I would hate to certify to such figures. How can you possibly know how many trade association costs, how many lush conventions at vacation spas, how much high rental to insurance industry satellites, what poorly allocated salaries etc etc are included?

BASIC POLICIES - We think that your Department (or the suggested FHIP) should draw up "minimum policies" which every company must market in order to be given a license to operate in any State. The face of the policy should show that basic premium and a schedule of possible rider additions that can be had. The premium of each rider should be sufficient to cover that rider and not be a bonus as is now done. And the riders should carry a lions share of the "plant cost" of the hospitals etc.

You attached a copy of your ten suggestions of areas for improving the present situation. The following are our direct comments on these items and we will cover as many of them as our assigned time permits. We ask that all items not covered be entered on the record as if we had covered them.

- 1 a - A very serious study and prompt solution of this matter of reimbursement methods must be made. The present paper work (which is not standard as to all companies) which is generated even retards the reimbursement and causes avoidable heavy expense both to the hospital, the medical man, and Blue Cross. The simplification of the policy coverage will eliminate a vast amount of the cost and confusion.
- c - Fostering of group practice prepayment plans. We are opposed to the continuation of stress on group coverage. The benefit gap between various group sizes and individuals, not only causes tremendous costs in record keeping, but is contrary to the concept of insurance, which is the sharing of risk by the many.
- d - Depreciation is in effect a deferred maintenance charge. Proper current

maintenance should restore depreciation wastage. Rather than accelerate Depreciation, we think building depreciation and major equipment depreciation should be adjusted downward to some extent by the actual cash maintenance expenditures each month. Many hospitals are built and equipped by donated cash and the total replacement in all probability will be done with donated cash.

- f - Reimbursement of low utilization facilities. The FHIP we suggest might well work out with various areahospitals just what facilities are needed. Then instead of each hospital being in total competition with each other, they would be in total cooperation with each other in rendering a full broadbased medical service. Not every hospital would have the identical facilities, but each must area would have what is needed, available to patients of any hospital. (In this connection our Committee's suggestion of ten insurance districts in Pennsylvania might produce the basis for determining area hospital equipment). Some excess standby facilities must be available and might well be subsidized by FHIP.

Open heart surgery is becoming a much used benefit. We think there must be a special study made as to how this can be made available at better cost to those who are not covered by the deluxe hospital plans. In low utilization hospitals, the cost should be equalized by FHIP or the patient should be assigned (along with his own doctor even if not accredited to that hospital) to a hospital which is designated in that area for such service.

- j - Bad debts should be eliminated entirely from costs. There should be an interhospital fund set up to reimburse themselves for bad debts. The agency supervising this reimbursement should conduct a hard-nose audit of what charges are on bad debt accounts to see if the very improper nature (such as unrendered services) charges might be the cause of the bad debt and refuse to reimburse that loss. This would be a self-policing of improper charging and unnecessary services.

Research costs should not be reimbursed. There are ample funds donated for such things and these funds can be obtained. This does not, of course, mean the normal laboratory tests -- it refers just to longterm exploratory research which is using the hospital equipment and patients as a ready laboratory in place of establishing an self-contained commercial enterprise elsewhere.

- 2 a - The State should be divided into Insurance Districts (ten of them). Each district could then also be a Hospital Utilization district. The object would be (under FHIP) to endeavor to spread out the various facilities so as to obtain maximum utilization. Then the individual utilization would be a lot more meaningful for rate study.
- c - Some reasonable guideline of required hospital stays should be worked out. We think this again should be done by FHIP, in cooperation with the medical profession (We are not questioning the dedication of the medical profession -- we are proud of them -- but the present escalation of costs has even them rocking on the ropes. In our opinion "reoperation and rehabilitation" joint facilities would have a major effect on this problem.
- d - Not much use debating this -- disallow it in one place and it would be buried skillfully in another. A proper "hardnosed policing" of hospital bills will go a long way to correcting the matter.
- 3 a - Disclosure of Blue Cross/Hospital contracts. Since Federal and State funds are permanently locked into payment of hospital bills, the private contracts should be a matter of record in the Insurance Department where proper committees from the Legislators could examine them. It is correct that the Insurance Department should keep well abreast of such contracts.

This is needed to keep the lid on radical medical cost increases just to make a high-level professional income for some at the expense of the public.

- b - We question the desirability of advising patients the cost of the services shown on their bills. We doubt if the vast majority of the patients would know what it was all about and might suffer a heart attack trying to work it out. In addition the cost of doing such a thing would be indefensible.

- 3 b However, we do think that every bill should have on it a prominent footnote "If the patient has any question as to any charge hereon, particularly as to whether the service was rendered, he has the right to refer the matter to the Penna. Insurance Department in Harrisburg, Pa."

Such a note would help greatly in breaking up those improper charges because "you don't pay the bill, so why worry".

- c With the Insurance Department and other proper Government agencies watching the interests of the public as well as the hospitals, it is hoped that there would be a minimum of things the public should watch. It is desirable that the hospitals be spared the tremendous cost of making miriads of unneeded "whim reports". A simplified medical coverage will release hundreds of hands to do necessary medical operating things which are now not done or inadequately done. This, in itself, should further cut down on costs.
- d Cost of per diem charges by hospitals should be publicized twice a year, particularly to the Legislators. We recommend that this be on the basis of the Insurance Districts previously mentioned for ready comparison. Then the Insurance Department in cooperation with the suggest FHIP should delve into the reasons for the discrepancies and endeavor to minimize them, knowing full well that you just can't get equal costs in every unit.
- e Not only should there be a disclosure of payments to such specialists who are not on a fixed annual salary and on the fulltime staff, but the matter of supplying sufficient help should be the function of the suggested FHIP. In my own experience, an anaesthetist was billed by the hospital and the same technician sent an additional personal bill because the hospital scale was not high enough.

We do not question adequate pay for medical experts and technicians but we think their own associations should set some reasonable guide lines

At the last Blue Cross hearings in Phila, we and others suggested that your Department obtain lists of everybody receiving over \$10,000 per year, especially the technologists and then crosscheck each list to locate the same name appearing on more than one hospital list — I knew, professionally, that such things did occur and presume that they still do. A little light could have a great effect in reducing costs. (Our own plan, when released will chart the way.)

- 5 e We recommend that something be done along the lines of having standard hospital plans drawn up for buildings, allowing for expansion. The facilities would then be more familiar to changing personnel and save much in construction and operating costs. This is mostly adaptable to new construction in open rural areas where the maximum load is still in the future. It permits those rural units to better function as standby and auxiliary facilities for urban plants, especially during crisis.
- 6 b Duplication of benefits, and/or duplication of reimbursements should be prohibited (as suggested in our remarks on advertising). Since such duplications are based on the premise that some policies do not cover certain items, it is imperative that the policies offered to the public must be strictly regulated so the consumer is not faced with a bewildering maze. This clarification of policies will, in itself, vastly cut down on the paper work and operating costs of even the insurance companies themselves, as well as hospitals.
- c This point is covered by our prior remarks asking for basic minimums which cover MUSTS, plus riders covering non-essentials at additional adequate premium.
- 7 a The matter of pre-admission testing and usage of outpatient care must be a matter to be supervised by an agency such as FHIP so as to gradually circumvent the unnecessary hospital entrance and length of stay and the services used on admittance. In other words, medical practice should again revert to a service and not to expand further into a research effort. Such control must be monitored by a meaningful department of FHIP.

- 7 2 Looking to the eventual (and obviously unavoidable) nationalization of medical attention at all levels - it is imperative that all account and reporting forms (ALL PAPER WORK) become uniform as promptly as possible. Those who are opposed to nationalization should be the loudest in calling for this standardization because it will permit proper comparisons which are impossible now. The present confusion precludes fair evaluation of either to the medical community or to the public.

- 8 a The public has only recently become aware of the fact that the Blue Cross organizations are under the control of the medical community. The Board should be service oriented, certainly not a political football, nor a medical/insurance company bonanza. Possibly only by area or state board supervision (FRIP) can such broad principles be attained. Otherwise it can be ego/competitive.

Blue Cross must be, what it started to be, a purchasing agency for the public. There is even frailty in that concept, however, in industry.

Until very recently, at least, Blue Cross has resisted public information. We bring to your attention our testimony in the hearings on Blue Cross in Phila. on April 16-17-18, 1970. We ask you to review that testimony and make it a part of the record of this hearing. In that we reported the downright arrogance of the Blue Cross officials in refusing to let us have access to papers on the filing. Following that hearing, we were given the courtesy of talking to those who should have been available without the unpleasantness. We think the entire medical community and the Blue Cross (the same as insurance companies in other fields) is engaged in "pulling the wool" over the eyes of the Insurance Commissioner for the benefit of others than the public. Up until now the mark on their faces has been even visible — we find the mark has been gradually disappearing, but the intent remains obvious. We for our part, will continue to fight.

- b We believe there should always be a consumer representative on all boards such as Blue Cross. Consumer groups themselves are not enough. There is no communication between consumer groups either and that is a calamity. Do not for a minute think that whereas Blue Cross started consumer oriented and became a desirable employment haven to be protected, that consumer groups cannot become the same. We hope your office will forever hold public hearings on rate increases to avoid the quiet "job pools" perpetuating.
- c We think that not only all Blue Cross subscribers, but that every other policyholder of every other type of Insurance should receive notice of requests for rate adjustments, plus notification of availability of appeal for help from the Insurance Commissioner, plus notification of the Insurance Commissioner by the Insurance Company/and or plan of each and every cancellation, refusal to renew, or refusal to sell.

We do not believe that either the public or the Insurance Commissioner is fully aware of what is going on. In fact, we note that you, Mr. Commissioner are asking for 50,000 policyholders to enter protests in automobile insurance. If what we have been asking for eight long years had been done (and we repeat that request above) you would have that 50,000 plus some 100,000 more protests right now. We will ask legislation on this particular point this year.

- d Yes, most decidedly policyholders should be advised of hearings. Just start this kind of notification and the number of requests will subside to what is really required and stop the "fat-calf-living" of insurance people.
- e We believe that if special T.V. forums were arranged at least once a year, or that some portion of the annual meeting of Blue Cross would be televised (like school board meetings etc), that people would become more interested because they would be better informed. At present most are simply disgusted and don't trust anything including Blue Cross and the Insurance Department itself.

It would also be meaningful if the Press (I mean a joint press-club) would hold televised interviews - excluding politicians and get down to earth discussion and debate at the people level.

- 9 a to f We believe the answer to a to f items in this category can be grouped as one.

Since health is an individual matter, health insurance is an individual matter.

If every health agency is controlled through the suggested RHP then you would have uniform standards, you would have uniform coverage, and you would have uniform charges.

Improper charges should never be paid. The real thing is that they should never be charged in the first place. Merely refusing to pay such charges is not the answer, because as an accountant, I know full well they will be buried somewhere else where you don't see them. You have to restore cash to the properly operated health agency. The answer is to have a health agency which does not want to live in ivory towers, especially when they are not being watched.

We are opposed to group coverage at special rates, especially when they carry more benefits, and this applies particularly to the medical field.

In our opinion the concept of credible and non-credible groups is an archaic premise which can't stand the test of human application. Arithmetic is a very inhuman thing. It has already been carried to the point of popular outcry — let's not carry it further to popular demand for socialists. In fact we call on the Penna. State Legislature to outlaw the concept of-credible/ non-credible and get down to health insurance.

- 10 a to c Yes the public can be better informed about the cost and dangers of over-utilizations,— and its own part in stopping such use. We think it could, and should, be in the form of the "forums" heretofore suggested. Such forums should be frequent and have uninhibited people participation and just not a platform for top officials to expound and cover up.

It could also be in the form of properly drawn leaflets or pamphlets, handed to each patient or attached to each bill to a patient. We think a "news short" at very frequent intervals on T.V./radio (possibly sponsored by the Advertising Council of America — or the insurance industry) would be very helpful.

Possibly a leaflet for insertion AT NO CHARGE in the newspapers, like they put the myriad of bargain rate insurance advertising material, would be helpful.

And above all, we think that HARD-NOSE POLICING OF ADVERTISING CAMPAIGNS by the Penna..Insurance Department (and the suggested Insurance Industry COUNCIL) which induce the overutilization, would be a prime curb on the practice.

And then maybe a public display of intentional overcharges might have an effect.

- 0 - 0 - 0

- TO SUM UP - We think that inasmuch as God brought humans into the world one at a time, and since we leave this world one at a time, it is high time that we accepted that fact insofar as health insurance and medical attention is concerned. We believe that everybody regardless of social status or pecuniary substance is entitled to equal medical service. One way to accomplish this is to make charges more nearly equal, if not entirely so. Groups have no prior preference so far as we are concerned. This will still not preclude those affluents who wish lavish attention obtaining and paying for it. We do not think the general public should subsidize the marble halls where they receive this attention, however. Socialized medical SHOULD be avoided, but we very much doubt if the influential portion of our society will PERMIT it to be avoided. Today is the Gettysburg of that battle — which way will we go?

STATEMENT OF H. C. THOMPSON, PRESIDENT, AND JOHN HUENNEBACH, EXECUTIVE
DIRECTOR, NATIONAL CONGRESS OF PETROLEUM RETAILERS

The National Congress of Petroleum Retailers supports most of the provisions of S. 976. Auto safety, the cost and efficacy of automobile repairs, the high cost of automobile insurance are issues in which our 75,000 gasoline retailer members have a vital interest. We deal face-to-face with the consumer on a day-to-day basis. We must, therefore, equate our self-interest with the consumer interest.

We believe, however, that certain aspects of Section 501(a)(2) of this bill run counter to such interests. As written, it would adversely affect approximately 60,000 retail gasoline dealers. These dealers are certified as vehicle inspectors under various State inspection programs. They have done this job well and in the best interest of the motoring public. This Section would wipe out their investments and operations. Yet, there is little likelihood that a better system would result.

Certainly, we agree with the need for a national and uniform motor vehicle inspection program. But, before State supervised inspection is eliminated in favor of a State operated system, we believe there should be substantial evidence that such a change will, in fact, benefit the motorist. Such evidence presently does not exist.

Indeed, there is evidence to the contrary. Pennsylvania, for instance, has perhaps the finest inspection law in the country and statistics have shown the beneficial effect it has had in creating safety on Pennsylvania highways. Citizens in other States deserve a system at least as effective.

However, Pennsylvania does not operate its own inspection system. Inspection stations in Pennsylvania are licensed and these stations themselves are inspected by the State Police. If a car owner feels aggrieved, he can complain to the authorities and if the complaint is found to be valid, the inspection station can lose its license.

In our opinion, a good nationwide periodic motor vehicle inspection act requiring inspections at least twice a year, makes good sense. However, a State, if it desires, should be free to utilize private facilities. Such facilities can be required to use qualified, certified mechanics licensed to do this work.

A private system saves the State the expense of building and equipping State inspection stations. It keeps manpower, such as trained, skilled mechanics from being drained from present repair shops where there is already a shortage. The inconvenience, cost and time involved when a car owner has to deal with the State monopoly may be far greater than through the utilization of private licensed inspection stations.

We submit that the most efficient and effective way to handle this problem is to utilize the private inspection system but under stringent State supervision. Both large fines and the revocation of licenses should be effective sanctions if it appears that the facility is not treating the consumer fairly.

We support tough State standards, adequate policing and licensing procedures. The public is entitled to no less.

But, we also believe our dealers are entitled to operate, as various States have licensed us to do, so long as we continue to operate with high standards. As long as private enterprise is demonstrating that it can do the job well, this method of operation should be available to the States if they desire to use it.

We ask only that we be judged on our performance. To date, that performance has operated in the best interest of the motoring public. Certainly, 60,000 dealers should not be legislated out of their investments and operations, unless strong evidence exists that there will be commensurate benefits to the consumer.

Presently, the evidence is to the contrary. It indicates that private inspection under stiff State licensing procedures is an excellent method of insuring safer highways.

We respectfully request, therefore, that Section 501(a)(2) be struck from the bill or otherwise altered to meet the objections raised in this statement.

STATEMENT OF CLARK E. FEGRAUS, PRESIDENT, AND M. VAN LOAN, VICE PRESIDENT,
AUTOMOTIVE ENVIRONMENTAL SYSTEMS, INC. SAN BERNARDINO, CALIF.

Automotive Environmental Systems, Inc. is pleased to have this opportunity to present our views on S. 976 as introduced by Senator Philip A. Hart and Amendment No. 67 submitted by Senator Ribicoff. Our comments will be confined to the subject of Diagnostic Inspections for safety and pollution.

The Subcommittee on Antitrust and Monopoly in a thorough investigation of automobile repairs, received thousands of letters from citizens concerned about their automobile, its repair problems and its maintenance and repair costs. We too, in our capacity as engineers and consultants in the field of automotive air pollution and safety, have received similar comments from the consumer. We have compiled and digested considerable literature on this subject, and have thoroughly investigated various schemes for vehicle safety and pollution inspection. Following are observations which we have made during recent years which are technically supported and which are highly pertinent to the proposed "Motor Vehicle Information and Cost Savings Act".

The consumer is generally unaware of the numerous safety problems that exist in his automobile. Studies by diagnostic centers and the Missouri Automobile Club indicate that the vast majority of cars on the road have potential safety defects. The number of actual safety defects is far less but still is a significant fraction. The contribution of these unsafe vehicle to the accident and mortality rate on our highways is not accurately known, but whatever this contribution, it is too much.

The consumer is unaware that the daily operation of his vehicle is costing him far more than it should because the engine is not operating efficiently or the transmission and brakes are improperly adjusted. Surveys show that the consumer feels that tuneups are too inconvenient, that a tuneup is too expensive or that their car is running properly. In addition, a majority of consumers rate their tuneup service good or excellent. However, a tuneup performed on the average car will cause a reduction in fuel consumption of 5-10% and an increase in power of about 10%. These figures may be considerably higher on older or poorly maintained cars. The irony here is that those consumers who can least afford a proper tuneup can least afford to waste gasoline.

The consumer is not generally aware that his automobile is a major source of air pollution in the United States, and is even less aware of pollution causing defects in his vehicle. Numerous studies by industry, states and the Federal government have indicated that vehicles emit far more pollutants than need be emitted. Vehicles which have been digested to meet low pollution standards deteriorate with use in the hands of the consumer. Because low pollution from vehicles is so intimately tied to proper engine operation, the normal lack of maintenance causes a severe increase in pollutants. For example, a misfiring spark plug can cause a 300-1000% increase in hydrocarbon emission levels. Improper idle mixture settings can cause a 50-200% increase in carbon monoxide emissions. A dirty air cleaner or improperly adjusted choke can cause a 50-200% increase in carbon monoxide and hydrocarbons. Improperly adjusted carburetion and spark timing can also cause great increases in oxides of nitrogen.

People are susceptible to sales efforts by mechanics or car salesmen. There is no attempt by the consumer to ascertain the vehicle's actual condition. Frequently the consumer has no place to turn to verify the safety, operational or emissions performance of his car.

Automobiles are becoming much more complex, as the consumer requires many power accessories, greater performance, larger automobiles; and as the government establishes safety and pollution standards. The average repairman or mechanic can not keep up with the latest information available about all aspects of all cars, and therefore certain aspects of repair or service do not get accomplished properly. Another reason for a lack of proper automotive service and repair is that the number of vehicles on our highways is increasing at a rate far greater than the number of mechanics and service facilities.

The foregoing observations serve to strongly uphold the urgent need for legislation such as S. 976 and Amendment No. 67. We view the diagnostic inspection system proposed in this bill as a potential incentive to the consumer to take better care of his vehicle and not as a government edict. The bill offers incentive to the manufacturers to consider maintenance and repair of safety, operational and pollution items in the design of new cars. It offers incentive to the service industry to upgrade and do a proper job.

An independent diagnostic inspection system would, if properly implemented on a periodic basis by states, provide the consumer with an unbiased evaluation of his vehicle. He could decide whether to repair it or to buy another; he could be assured of a vehicle's condition before purchase; and he would be guaranteed that after damage his car would be safe.

Periodic diagnostic inspections are essential to effective vehicle pollution control and vehicle safety because:

Many people will defer needed repairs as long as possible unless they are compelled to correct deficiencies determined by inspection.

Conversely, many people will strive to upgrade their vehicles in anticipation of inspection, if the inspection is generally accepted to be effective and thorough.

Many pollution and safety related deficiencies develop gradually and the motorist is often unaware of their existence. Only by suitable inspection are such deficiencies likely to be determined.

The information and data that may be derived from vehicle inspections will be extremely valuable in pinpointing automotive service problem areas, as well as developing ongoing controls.

Periodic motor vehicle inspections of a diagnostic type may serve as an important measure in reducing automotive service costs by diagnosing vehicle ills more accurately.

We at Automotive Environmental Systems, Inc are very concerned that diagnostic inspections *per se* will be construed by many, as the solution to our vehicle repair, safety and pollution problems. Diagnostic inspection is not the solution, but an important means to effect or induce the solution. The true solution is, of course, accurate, honest and economical automotive service. If this bill or any vehicle safety or pollution control measures are to be effective, a major change in the profile of the automotive service industry is essential.

Regardless of how clean and safe new cars are, new cars become used cars as soon as they are driven home by the proud purchasers. All vehicle systems, including safety and pollution control systems, deteriorate with time and use, and will continue to do so for the foreseeable future. Unless these systems are properly maintained, vehicle pollution and vehicle safety will continue to be serious national problems.

Periodic diagnostic inspections will involve the use of procedures and equipment with varying degrees of sophistication. If deficiencies determined during inspection are to be corrected properly, the procedures and equipment at the service facility must be at least equivalent in sophistication.

New cars are safer and "cleaner," from a pollution standpoint. However, they are more complex and require more precise tuning and adjustment. Furthermore, this trend will continue and intensify in the next few years. Accordingly, automotive technicians must be better trained and capable of using new and more sophisticated equipment and procedures.

As has been emphasized in last year's hearings by the Senate Subcommittee on Antitrust and Monopoly concerning the automotive service industry, there is a serious and growing shortage of qualified automotive service personnel. If the vehicle safety and pollution challenges of the 1970's are to be met successfully, this problem must be solved through new concepts in recruiting and training. New Federally sponsored employment and training programs should be directed to this end.

Depending upon the stringency of inspection standards set, a dramatic increase in workload for the automotive service industry can occur with the inception of periodic inspections. This will further aggravate the problem of personnel shortage previously mentioned.

In conclusion, our experience has convinced us that periodic motor vehicle inspection, together with a major upgrading and expansion of the automotive service industry, are absolutely essential for vehicle pollution control and improved vehicle safety. Any actions, such as S. 976 and the amendment which will promote these measures, are urgently needed.

STATEMENT OF CHARLES L. RUE, OPOU, CHAIRMAN, NATIONAL AFFAIRS COMMITTEE
INDEPENDENT MUTUAL INSURANCE AGENTS ASSOCIATION OF NEW YORK, NEW
JERSEY AND CONNECTICUT

PURPOSE

This statement is submitted in lieu of verbal testimony to outline the position of the Independent Mutual Insurance Agents Associations of New York, New Jersey and Connecticut relative to HR-4994 in particular and the concept of "no fault" or "no fault" automobile insurance in general. These associations represent a total of approximately 3,500 independent insurance agencies and 10,000 insureds.

ual agents. We respectfully request that this document be entered in the record of the current hearings on HR-244.

POSITION ON FIRST PARTY REPARATIONS SYSTEM

These three associations, individually and collectively, strongly support the concept of a first party approach to accident reparation system, commonly referred to as a "no fault" system. This position stems from an intensive study of a violent reparations initiated by our own three-state Auto Study Committee in 1967, the findings of which were published in September of 1968 and can be provided upon request.

Although we have not proposed and do not contemplate proposing a specific reparations plan of our own, our ultimate objective is a pure no fault system. At this time, however, we are prepared to support any limited or hybrid plan which represents an intelligent evolutionary step in that direction.

OBJECTION TO TORT SYSTEM

Our objections to the present tort liability system may be summarized as follows:

1. Claim settlements have tended to be painfully slow, with delays of anywhere from several months to several years remaining commonplace in the case of large claims associated with serious accidents.
2. Many accident victims presently receive no compensation for their losses, perhaps because of some insignificant degree of contributory negligence. Similarly, many are grossly underpaid for their losses.
3. A significant portion of many tort settlements is diverted to court costs and legal fees, never reaching the accident victim.
4. The tort system appears to have created serious court congestion.
5. Fault itself, the basis of the tort system, is extremely difficult to prove in many cases and impossible to prove in some.
6. The process of proving fault generates high investigation costs for the insurance companies involved.
7. Finally—despite its supposedly punitive nature, the tort system has apparently done little to reduce our disgraceful highway accident rate or remove chronic offenders from the road.

ADVANTAGES OF FIRST PARTY SYSTEM

Our studies lead us to believe that at least five major advantages would accrue from a first party system:

1. It would result in faster claim settlement. This is a decisive factor in the immediate aftermath of serious accidents, when medical and or repairs bills accumulate most rapidly, when victims most frequently find themselves confronted with financial crisis and when funds are urgently needed for rehabilitation of seriously-injured persons.
2. It would lead to more equitable settlements, with every accident victim receiving reasonable compensation for his losses and a smaller portion of any settlement being eroded by litigation costs.
3. The direct buyer-seller relationship between the insured person and his insurance company would probably minimize the tendency of some companies to resist all claim settlements, even those which are clearly justified.
4. It would probably reduce court congestion.
5. It would eliminate the costly and difficult problem of proving fault before compensating the accident victim.

MINIMUM REQUIREMENTS

We consider the following to be the minimum requirements for any acceptable first party reparations plan:

1. It *must* place the automobile insurance in a primary coverage position (See subsequent comments).
2. Mandatory coverage—whether pure first party or some combination of first party and tort rights—must be high enough to insure reasonable repayment and rehabilitation of the accident victim and prevent his becoming a public charge.
3. It must offer sufficient first party protection to cover costs which might reasonably be anticipated in the immediate aftermath of an accident.

4. It must make some provision above and beyond basic statutory coverage for unusual circumstances such as permanent impairment, disfigurement, dismemberment or death.

5. It must offer some form of optional coverage for catastrophic losses.

6. It must provide liability coverage for out-of-state accidents.

7. It must provide ample residual liability protection to cover situations not otherwise covered in the basic provisions of the plan.

PRIMARY VS. SECONDARY COVERAGE

On one point we are adamant and will not compromise: Automobile insurance *absolutely must* occupy the primary coverage position in the settlement of any and all claims arising from automobile accidents. Conversely, it *must not* be placed in a position secondary to collateral coverages held by the insured. We base this reasoning upon the following four points:

1. Persons carrying valid automobile insurance who are injured in automobile accidents should not be required to exhaust benefits which they have accrued to protect themselves against natural illness or other mishaps.

2. Administrative confusion resulting from a secondary coverage system would be monumental. It would be virtually impossible to devise a comprehensive rating system for automobile insurance which would mesh with the staggering number of accident, health, medical and income protection plans offered through other sectors of the insurance industry.

Furthermore, shifting administrative costs of processing bodily injury claims to hospitalization insurers would not greatly reduce the administrative burden on the auto insurer, since any accident causing significant injury will undoubtedly be accompanied by a considerable degree of property damage. Hence, the auto insurer is already in the act, and the additional administrative cost of processing the injury portion of the claim would be negligible.

3. The economic cost of highway accidents should be borne entirely by highway users. Yet, a secondary coverage statute, while undoubtedly effecting some savings in automobile insurance premium, would simply shift the burden of highway economic losses to the rest of the public in the form of higher premiums for other hospitalization and/or medical insurance.

4. People buy automobile insurance to protect themselves against losses suffered in automobile accidents, and that insurance alone should protect them fully against all such losses, except where covered by workmens compensation.

Despite our full support of the first party concept, we will commit all of the resources at our disposal against any plan or any bill which relegates automobile insurance to a secondary position.

OBJECTIONS TO H.R. 4994

H.R. 4994 has many meritorious provisions, which point toward our own ultimate objectives. However, we have objections (two of them serious) and/or reservations with regard to the following provisions:

1. Sec. 2(12) (A)—definition of "net economic loss." Places automobile insurance in secondary coverage position to collateral coverages. Totally unacceptable to our associations for reasons outlined immediately above.

2. Sec. 3. Virtually mandates compulsory bodily injury automobile insurance on a nationwide basis. While the idea may have some merit, it is infringement upon state rights. Furthermore, even in such states as New York, one of the pioneers in strict compulsory automobile insurance, a significant percentage of uninsured drivers still find access to the highway.

3. SEC. 5(a) (7) (A)—places certain responsibilities for "a percentage" of net economic loss upon the insurer of a "larger" vehicle. Far too vague. What percentage, and what is a "larger" vehicle?

4. Sec. 5(d) (1)—an ironclad mandatory issue, guaranteed renewal, guaranteed non-cancellation provision. This is unprecedented coercion of private enterprise, which would probably lead to bankruptcy of the private insurance industry in short order and would also mandate perpetuation on American highways, by a captive insurance industry, of the criminally negligent and the chronic offender. Even the most stringent state cancellation and non-renewal laws grant exclusions to insurers for such reasons as use of an automobile in commission of a felony, conviction for driving while under the influence of alcohol or drugs, conviction for leaving the scene of an accident, and other serious offenses. This provision of this act would grant free rein to these undesirables. Totally unacceptable to our associations.

5. Sec. 7(a)—would establish, at state level, an "assigned claims plan." The objective is obvious and basically sound—namely, to deal with contingencies not otherwise covered in the basic law. We have no specific comments, no specific suggestions, and our reservations are intuitive rather than tangible. We simply wonder if this is the only, or even the best, approach to this problem. We suggest that this mechanism be reviewed and analyzed *very* carefully before it is implemented.

If amended to eliminate the five deficiencies outlined above, H.R. 4994 would be considered highly acceptable to our associations—if presented in the context of model guidelines for state level legislation.

STATE VS. FEDERAL REGULATION

The concept of federally-mandated *standardization* of automobile accident reparations law is by no means distasteful to our associations. In fact, it has considerable merit.

However, the concept of federal *control* of the system is utterly repulsive. It would, for one thing, require the establishment of still another layer of expensive federal bureaucracy, which could rapidly negate any savings that might otherwise accrue from such a system.

Secondly, it would constitute another serious infringement upon state rights, the foundation of which, in terms of insurance regulatory power, was clearly recognized and defined in the McCarren Act of 1945. In context with this, we submit that the states, for the most part, have done a fairly respectable job of regulating the insurance industry.

Finally, we warn that the imposition of additional expensive controls at still another level of government could further inhibit operations of the private insurance industry and further restrict already deteriorating insurance markets.

Therefore, we hope this committee will limit its objectives to the establishment of reasonable standards for auto accident reparations and tread with extreme caution in the area of local control. A very large industry, employing millions of people and serving the entire population of the United States, could be at stake.

STATEMENT OF BENJAMIN S. MACKOFF, ADMINISTRATIVE DIRECTOR, CIRCUIT COURT OF COOK COUNTY, ILL., TO THE SUBCOMMITTEE ON COMMERCE AND FINANCE OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE

In the past 20 years, the nation's courts have been deluged by civil litigation arising out of automobile accidents. This has occurred because of the staggering increase in motor vehicle registration and because courts have historically provided the only forum in which to seek compensation.

As long as the case load was manageable, the courts were able to provide adequate and speedy justice in such matters and still dispense services needed in other areas of the law. But in most metropolitan areas of this country today, the time it takes to get to trial in personal injury cases is measured in years. Despite the implementation of a variety of techniques to expedite litigation, the delay continues at an increased rate. Those courts that have kept pace with the steady rise of such filings have done so only at the expense of other vital areas of the law which then suffer from similar delays, or worse yet, "bargain basement justice".

Delay in the courts is becoming an embarrassing contradiction to our entire system of justice. It deprives citizens of a basic public service; lapse of time frequently causes deterioration of evidence; delay may cause severe hardship to some parties and affect litigants differentially; and, it generally brings to the entire court system a loss of public confidence, respect and pride.¹

As Justice Ulysses S. Schwartz of the Illinois Appellate Court stated in *Gray v. Gray*, 6 Ill. App. 2d 571 (1955) :

The law's delay in many lands and throughout history has been the theme of tragedy and comedy. Hamlet summarized the seven burdens of man and put the law's delay fifth on his list. If the meter of his verse had permitted, he would perhaps have put it first. Dickens memorialized it in Bleak House, Chekhov, the Russian, and Moliere, the Frenchman, have written tragedies based on it. Gilbert and Sullivan have satirized it in song. Thus it is no new problem for the profession, although we doubt that it has ever assumed the

¹ "Delay in the Court," by Buchholz, Kalven, Jr., and Ziesel.

proportions which now confront us. "Justice delayed is justice denied," and regardless of the antiquity of the problem and the difficulties it presents the courts and the bar must do everything possible to solve it.

And yet there is very little incentive for the speedy disposition of a pending personal injury lawsuit under the present system. Neither the culpable defendant nor the plaintiff with a very tenuous nuisance claim has reason to hasten the day of reckoning. The insurance company makes money during the delay on its reserves—the money it does not pay out as claims. The defense lawyer gets paid by the thickness of his file—the amount of work and the number of court appearances he has made. Even the plaintiff's lawyer has sound economic reasons for not wanting his case disposed of. If the plaintiff's lawyer accumulates a certain number of dispositions, his fees are greatly diminished by taxes and, I am told, the prudent lawyer will always want an inventory or backlog of pending cases for the proverbial "rainy day".

Other than the courts prodding the cases through to conclusion, there is generally no real effort by any of the participants to gain a measure of speedy justice. Some courts even refuse to hurry the matters along, preferring to wait until the lawyers indicate that they are ready to proceed.

And other abuses have grown with the system. A few well-publicized "big verdicts" have led many of the public to believe that they are entitled to enormous sums for minor injuries or could receive such sums if they are represented by a lawyer who will "build a case" for them. And there are always those few who will prey on these expectations. Unscrupulous lawyers, attracted by large contingent fees solicit cases personally or through agents, contrary to the ethics of the legal profession. They sign up accident victims by promising fantastic sums even while the would-be client is stretched out on the street or en route to emergency surgery. These same lawyers corrupt police officers and firemen, who may be the first to the scene of the accident, to direct them to the victim for a fee and even to color their testimony if it becomes necessary. "Ambulance chasing" induces some clients and doctors to exaggerate injuries and tradesmen to inflate bills or approve such inflated bills. The system, at its worst, encourages accidents to be contrived and injuries to be fabricated to defraud the unsuspecting defendant or the unwary insurance company.

Nor are the unscrupulous lawyers the only culprits in the system. Eying the large sums spent annually for casualty insurance premiums, many investors have organized insurance companies for the sole purpose of paying themselves high salaries while contesting claims, so as to milk the company until it is insolvent.

One can imagine the shock to the defendant driver when he realizes that rather than being insured against a claim, he must pay the judgment out of his own pocket, or even be assessed an additional one year's premium to pay for claims against other defrauded by the same insurer. And what of the tragic consequences to the severely injured plaintiff who discovers that the uninsured defendant has insufficient funds to pay even a portion of whatever judgment may be rendered against him.

Others have pointed out the high cost of acquiring casualty and the difficulty of obtaining renewals. But an often overlooked problem is the cost to the taxpayer of maintaining the system. It has been estimated that it costs approximately \$250 per hour to try a jury case before adding attorney's fees and witness expenses. That cost is hardly less for non-jury court time. If one considers that many courts throughout the country assign a substantial portion of their trial bench to the processing of automobile accident cases, one may appreciate the handsome contribution which the taxpayer makes.

And what does the taxpayer get in return for his tax dollar? An orderly and effective litigation of actual disputes? On the contrary, it is a rather distressing symptom of the abuses now ensnaring the courts that a very low ratio of cases is actually decided by a trial of the issues. In some courts that ratio is as low as two or three per cent. This statistic indicates to me that the court is being used merely as a forum for the claims adjusting bargaining process. The judge becomes an umpire between two parties who do not really seek a determination of the legal matters involved. The court, sacrificing its traditional function of deciding actual disputes, simply oversees the haggling between lawyers of whether or how much to pay to whom. In no uncertain terms, the taxpayer is subsidizing insurance companies to negotiate its own claims within public facilities and on judge time.

All this occurs at a time when new and important matters are being thrust upon the courts for decision. Expanding constitutional requirements of due process have added new aspects to criminal proceedings and demand a more formal trial

in juvenile cases. Third party and class actions are now commonplace in many areas of civil litigation. New remedies available for consumer and environmental protection, as well as for welfare recipients and apartment dwellers, represent new demands on court time.

Judges are key human resources of our nation's courts, whose time must be allocated consciously to reflect our country's priorities. The heavy burden of automobile accident litigation may be relieved in some measure by providing the courts with more judges. But for the moment, the litigation of these cases consumes a disproportionate and totally unjustifiable amount of judge time. There is no question but that the continued over-emphasis on personal injury cases will divert attention from other deserving areas of the law.

In my judgment, the extension of tort remedies to automobile accident victims is in no way vital to our system of government. It is simply a convenient device conceived in the 13th and 14th centuries as an extension of the laws of trespass and handed down from the English common law. While it is important that victims of motor vehicle accidents be compensated in a just and efficient manner, it is not critical that this system of compensation operate as part of our judicial system. In certain respects, the courts are an inappropriate forum. Abuses and inefficiencies abound in the present arrangement. For these reasons—that the continued maintenance of this scheme of compensation not only fails to serve its own ends effectively, but also impairs the disposition of litigation more vital to our liberties, a reordering of priorities is called for.

The time has come for new and bold measures to compensate automobile accident victims which will allow the courts to more effectively serve the public. One such way may very well be through the adoption of the legislation now pending before this subcommittee. Congress has seen fit to legislate certain minimum highway safety standards to minimize the risks of driving. Surely Congress has the authority to set down minimum standards for compensation to accident victims to mitigate the harsh consequences of accidents that do occur.

INTERNATIONAL LONGSHOREMEN'S & WAREHOUSEMEN'S UNION NINETEENTH BIENNIAL CONVENTION, HONOLULU, HAWAII

STATEMENT OF POLICY OF AUTO INSURANCE REFORM

Soaring premiums, inequitable settlements, lengthy delays in the settlement of claims and unfair cancellations of policies are major reasons why consumers are up in arms over auto insurance. A \$2 million, two and one-half year study of auto insurance conducted by the Department of Transportation has concluded among other things that (1) fewer than half of those persons killed or injured in car accidents receive payments from the present liability system, (2) victims with economic losses of more than \$25,000 are repaid only an average of one-third of their losses, and (3) the major portion of auto insurance premiums goes for court and lawyer costs, and other non-benefit expenses. In New York alone, for example, about 23% of injury liability premiums go to lawyers and claims investigators.

Following completion of its study the Department of Transportation was prepared to make an extensive series of legislative recommendations for reform in the industry. The President, apparently having checked with major insurance carriers and such groups as the American Trial Lawyers Association, blocked them. Richard Barber, who headed up the study, described the President's recommendations for auto insurance reform as "disgraceful sham." Compared to the Original Department of Transportation recommendations, he described the White House approach as "pale, anemic, and lacking in substance."

Senators Philip Hart and Warren Magnuson, in opposition to the President, have sponsored meaningful legislation for auto insurance reform. Their approach provides partial no-fault insurance for everyone. One's own insurance company would compensate accident victims for lost wages, medical care costs, and rehabilitation and death benefits immediately, and without determination of fault. Victims could subsequently seek redress through the courts for claims in excess of \$30,000. The Hart-Magnuson program would allow cancellation of policies only for lack of payment of premiums or loss of driver's license. It would also abolish the legal prohibitions in 36 states against the selling of lower cost, true group auto insurance.

In the long run, the ultimate solution to our auto insurance headaches is government run insurance operated along the same lines as workmen's compen-

sation. Short of there being an immediate prospect for a comprehensive government plan, the ILWU joins the rest of the labor movement in demanding prompt enactment of the Hart-Magnuson proposals for auto insurance reform—a long overdue first step toward making the present system one which is equitable, efficient, and less expensive.

STATEMENT OF ANTHONY SCARIANO BEFORE THE COMMERCE AND FINANCE SUBCOMMITTEE OF THE HOUSE INTERSTATE AND FOREIGN COMMERCE COMMITTEE ON H.R. 7514

Mr. Chairman and members of the subcommittee: The current auto accident compensation system "needs change badly, and needs it now." Secretary Volpe's conclusion is borne out by the detailed study conducted by his department. The Transportation Department's study and final report summarizes on a national level the results of many, many studies, including the landmark Keeton-O'Connell work. All of these documented conclusively the urgent need for change. I fully support H.R. 7514 and urge you to report it out as soon as possible.

In 1967, after reading the Keeton-O'Connell book—*Basic Protection for the Traffic Victim*—I sponsored with five of my colleagues a no-fault auto insurance bill in the Illinois House. The bill was modeled after the Keeton-O'Connell Basic Protection Plan. It died in committee. As a matter of fact, I wasn't even accorded the courtesy of a vote on the bill. In 1969, I again introduced a no-fault Keeton-O'Connell type plan. "What are you trying to do", asked my lawyer-colleagues in the House, "repeal our livelihood?" Many of the legislators actively engaged in the insurance business expressed the same attitude. It's not surprising that a good no-fault bill has little chance of passage in Illinois.

According to the 1969 Handbook of the Illinois Legislature, out of 177 Members of the House, 55 listed their occupations as "lawyer", and 25 listed their as "insurance". Out of 58 Members of the Senate, 19 were lawyers and 11 were in the insurance business. But, as you gentlemen know, the business of a legislature is conducted, for the most part, in its committees and subcommittees. The Illinois House Insurance Committee, to which my no-fault bills were referred, had eight lawyers and four men in the insurance business as members. There were 12 potential votes against no-fault out of a total committee membership of 17. The 12 member Insurance Division of our Senate Financial Institutions Division Committee had six lawyers and three insurance people on its roster. These data do not include the number of legislators who have an interest, direct or indirect, in insurance companies.

In Illinois, as in most of the States, the job of being a legislator is not full time. Of course, there are some exceptions, as with retired persons. However, nearly all the lawyers in our legislature are actively engaged in the practice of law. A number are plaintiff and defense lawyers.

Now Illinois is not the exception. Attached to my statement are two presentations of data showing the number of members on State legislative committees having jurisdiction over no-fault bills whose occupations were listed as lawyer and insurance for ten states in 1969, and the number of members of the same ten state legislatures who were lawyers and in the insurance business that year. By the way, one-half the motor vehicles registered in the United States in 1969 were in these ten states.

An up-to-date survey of the occupations of the members of the committees having jurisdiction over no-fault bills in the ten states with the largest number of motor vehicle registrations in 1969, show that there were 105 million registered motor vehicles that year, and 55 million were in these ten states. I ask, Mr. Chairman, that this survey be made a part of this record.

I think that we all are deluding ourselves if we expect State legislators who are in the active daily practice of law, or who are selling insurance, to enact good no-fault plans similar to H.R. 7514, or containing the type of benefits outlined under the Department of Transportation's "Specific Recommendation" at pages 133-137 of its Final Report. And those who suggest that such meaningful reform can be brought about at the State level during the next 5 years, and urge the public to support a state by state approach, are playing a cruel hoax on the long suffering auto accident policyholder and potential victim.

A number of state constitutions prohibit limitation of the amount which may be recovered in actions for wrongful death, or in any suit for personal injury or death. Some of these states are: Arizona, Kentucky, New York, California, Pennsylvania. (See: *Constitutional Problems in Automobile Accident Compensation Reform*, Department of Transportation, April, 1970, p. 43, footnote 30).

Obviously, it will take longer in these states to enact no-fault auto insurance.

Even if the states were to enact reform now, what would their programs be like? Take for instance the Illinois Auto Reparations Plan made public last month by Governor Ogilvie and Insurance Director Baylor. This proposal provides for some compulsory medical and wage benefits to be paid by an injured persons own insurance company on a first party basis, but retains completely the fault-liability concept for everyone and for all claims. This plan would increase litigation and would require motorists in Illinois to buy the mandatory first party coverage as well as liability insurance—thus two policies would be sold the public. Director Baylor's letter transmitting in his insurance department's plan to Governor Ogilvie contains the following concluding paragraph: (and I quote) "By the adoption of the Illinois Plan, our State will be in the vanguard of improvement to the reparations system. In so doing we shall fulfill by action our promise, "In the New Illinois, We Accommodate"

I commend the Illinois Insurance Director for his candor. The Illinois Plan, if ever enacted, would "accommodate"—the pocketbooks of lawyers, insurance companies and their agents.

That the Governor's benefit program for lawyers and insurance companies is not fooling everyone, I submit for this record a copy of a column by Jack Mabley in *Chicago Today*, April 15, 1971. A copy of that column is attached to my remarks. With your permission Mr. Chairman, I would like to provide also for this record a copy of Professor Jeffrey O'Connell's paper criticizing the Governor's plan.

If the enactment of a no-fault system beneficial to all the people is the national goal, as this Administration claims, then as a State legislator with over 15 years experience, I cannot understand how that goal is going to be achieved on a state-by-state basis. There must be a national uniform program as envisioned in H.R. 7514.

Gentlemen, I repeat, I support H.R. 7514.

[From Chicago Today, Thursday, Apr. 15, 1971]

NO-FAULT CAR INSURANCE HAS FAULTS

(By Jack Mabley)

If you don't own a car and there is none in your family, you can sit back and laugh at the ballooning expenses of car owners.

But if you are tied to auto cost one way or another, your troubles are getting worse.

The Illinois Insurance Department two weeks ago, proposed what is called a "limited" no-fault automobile insurance system. On paper it looks great. Insurance Director James Baylor said it probably would reduce the cost of auto insurance.

No-fault auto insurance works the way fire insurance works. If there is an accident [fire], the insurance company pays for your loss, regardless of the cause, or fault.

It would save motorists money because more than half of the billions in premiums paid by motorists goes to lawyers, adjusters, agents and insurance companies. Less than half of the consumer's premium winds up with the accident victim.

The no-fault system is the brainchild of Prof. Jeffrey O'Connell of the University of Illinois Law School and Harvard law professor Robert E. Keeton. They proposed it in 1965 [and we reported it then] and because it is an idea whose time has come, it is gradually being adopted around the country.

But O'Connell has taken a good look at the Illinois proposal, and shaken his head in dismay. "In essence, the governor proposes to add on no-fault insurance to the present fault system, thereby preserving much of the waste and inefficiency and corruption of the fault system," says O'Connell.

The Illinois proposal provides for some no-fault benefits, but retains the right of everybody to sue under a fault claim.

"Governor Ogilvie's bill is closely fashioned after bills recently proposed by the National Association of Independent Insurers and the American Mutual Insurance Alliance—two of the principal trade organizations that write over half of all auto insurance in the United States, and which have long been bitterly opposed to no-fault insurance," stated O'Connell.

"If those segments of the insurance industry succeed in selling their plan or variations of it to the public, they will have succeeded in putting over a system they like best—a system whereby they get to sell everyone two policies covering every accident instead of one: one policy for fault insurance, and the other for no-fault insurance.

"No wonder these segments of the industry back the governor's proposal," O'Connell said.

The plan has been put up to the legislature. Over in Champaign they have the man who wrote the book. He must be called to testify on the bill. Then the legislators can listen to Baylor, and decide who's right.

Maybe you can escape auto costs by shunning autos, but I don't know any way you can duck medical costs unless you are willing to risk financial catastrophe by going without insurance.

There is an unbelievable situation existing in hospitals since the Illinois Supreme Court decision in September that hospitals may be sued if a patient gets hepatitis thru a blood transfusion.

Any hospital or doctor giving a transfusion today faces the chance of being sued if the blood is contaminated. There is no fool-proof way to screen blood or donors.

The alternative is not to give the transfusion, in which case the patient may die, and the doctor and hospital may be sued for malpractice.

The real horror of this is the reality that from a dollars and cents standpoint it is better not to give the transfusion because damage awards in deaths are much lower than damage awards given to patients who survive.

Fortunately, a bill has passed the Illinois House, and is pending in the Senate Judiciary Committee, relieving hospitals and doctors of liability for hepatitis transmitted thru blood transfusions.

If this bill doesn't become law, liability insurance for hospitals will go sky high. It could cost a patient as much as \$15 a day per room.

A hospital with which I am familiar paid \$2,500 for liability insurance 8 years ago. This year the cost is \$37,000, and that doesn't even reflect the hepatitis problem.

And to frost this whole cake, it might interest you to know that lawyers for hospitals and drug firms are worried that if the no-fault insurance plan becomes law, the personal injury lawyers who have made fortunes in accident cases are going to turn to new fields to conquer—and there sits the health care industry, ripe for plucking.

STATEMENT OF PROF. JEFF O'CONNELL CRITICIZING OGILVIE "NO-FAULT" INSURANCE BILL

Governor Ogilvie's proposal for reform of auto insurance is an acute disappointment to those who have labored long for reform in this area.

In essence, the Governor proposes to add on no-fault insurance to the present fault system, thereby preserving much of the waste and inefficiency and corruption of the fault system: and yet it is the inadequacies of the fault system which lead to the need for no-fault insurance in the first place. In other words, while the Governor's plan provides for some no-fault benefits, it retains the right of everyone to still sue under a fault claim. So all of us will now need two auto insurance policies covering the same range of loss: one for no-fault claims by us, and a second for fault claims *against* us. Says the Governor's report, announcing his proposal, "Even though the plan provides prompt payment [by no-fault insurance] of most of the economic losses which the injured victims suffer, they are not prevented from making a claim against the wrongdoer, or his insurance company, for other damages or losses they may have incurred as a result of the accident, including pain and suffering."

The folly of the kind of reform proposed by Governor Ogilvie can best be illustrated this way: Today under auto insurance, I am called on by law to insure myself for paying your losses if I am at fault, and you are called on by law to insure yourself for paying my losses if you are at fault. But "who is at fault" is so unpredictable that for years insurance companies have offered the option of some no-fault coverages whereby I can insure payment to myself and my family regardless of fault, and you can likewise insure yourself and your family regardless of fault. But these supplemental no-fault coverages (payable only for car damage and limited medical expenses) in no way diminish the need for—or payment under—fault insurance payable to the occupants of the other car.

And now, Governor Ogilvie is advocating as a solution to the ills of auto insurance move required supplemental no-fault insurance. But since I must thereby insure myself and you must thereby insure yourself, each regardless of fault, why do we also need liability insurance based on fault as the Governor proposes? Especially is the question pertinent when fault insurance is so wasteful, paying much more for lawyers and insurance overhead than in benefits to you and me. *in other words, since you cover yourself for your loss regardless of who was at fault, and I cover myself for my loss regardless of who was at fault, why do we need to sue each other over who was at fault? Who benefits from all those suits over who was at fault except lawyers and insurance companies?*

What truly meaningful reform entails, then, is going much further with no-fault coverage by amending the law so that it no longer calls for me to insure you and you to insure me under an unworkable [fault] coverage. Rather each of us will insure himself under a workable [no-fault] coverage, with each of us then being in a position to *forget* about claims based on fault.

Even the recent Massachusetts no-fault law—which is a very limited and inadequate no-fault law—goes much further in crucial respects than Governor Ogilvie's proposal. At least the Massachusetts law eliminates *all* fault claims where medical loss does not exceed \$500. But the danger of even the Massachusetts bill is that the fault claims are preserved in so many cases that there is a danger that sooner or later they will increase to the point where we will approach that dangerous situation of having both fault and no-fault applicable to the great mass of smaller and medium size claims, with the corresponding risks of corruption and skyrocketing costs.

After all, at today's medical costs, by putting a person in a hospital for a few days and running a battery of tests, the \$500 Massachusetts ceiling before fault claims can be brought can readily be breached. Given the long history of lawyers, doctors and victims exaggerating traffic claims for their profit, such a plan offers thin protection against the evils of the present fault system.

But Governor Ogilvie's proposal is much worse than the weak Massachusetts law. The bill calls for substantial no-fault payments up to around \$2,000 for medical bills, for example, and for wage loss, but would also allow fault claims

still to be brought within the same range of coverage in every case. Damages for pain and suffering in such fault claims would be limited to one-half of the amount of medical bills if those bills were less than \$500 and to an amount equal to the medical bills if they were over \$500. In cases of very serious injury (death, permanent disability, etc.), there would be no limit on payments for pain and suffering. In all cases, any no-fault auto insurance payments would be allowed to duplicate most payments made from other no-fault coverages, such as Blue Cross or sick leave.

There are at least two fatal flaws in such a proposal. Note that in *every* case, fault claims are preserved, retaining the possibility of lawyers and adjusters fighting over who is at fault in every accident. Secondly, there is still the temptation in every case to pad on medical bills, to duplicate payment already made from Blue Cross and sick leave, etc., and to increase payment for pain and suffering. So the nuisance value and waste of small claims—the cancer of the present system—are retained, albeit with the jackpot cut down somewhat. What could be greater folly than to waste precious medical and insurance resources by (1) guaranteeing people that their medical bills will be paid and (2) then encouraging them to incur unnecessary medical bills (which are guaranteed) by assuring them that for every guaranteed dollar expended for medical loss they will be paid an extra 50 cents or a dollar, supposedly for their pain and suffering. What have they to lose by padding their medical bills? Isn't this a way of coining money? Indeed it may be even worse: Under Governor Ogilvie's plan, if a person is paid \$100, say, from Blue Cross for his medical bills, he will be entitled to the \$100 all over again from his auto no-fault insurance. He is then allowed to sue the other driver to be paid \$50 for his pain and suffering, *plus* apparently \$100 more to duplicate the Blue Cross payment. (The plan is ambiguous on this last point.) But even without that last \$100 payment, the waste and duplication is shocking and scarcely much of an improvement over the present shockingly bad system. What sensible no-fault insurance ought to do is to see to it that such medical loss is paid *once* and have that be an end of it. Under the Governor's plan, then, a person receiving no-fault benefits may still sue under a fault claim for:

- (1) his pain and suffering.
- (2) 15% of his wage loss up to a total wage of \$150 a week.
- (3) all of his wage loss above \$150 a week.
- (4) all of his losses already covered by, say, Blue Cross or sick leave.
- (5) his property damage.

Won't that inevitably mean many fault claims on top of no-fault claims?

Governor Ogilvie's bill is closely fashioned after bills recently proposed by the National Association of Independent Insurers and the American Mutual Insurance Alliance—two of the principal trade organizations of insurance companies representing companies that write well over half of all auto insurance within the United States and which have long been bitterly opposed to no-fault insurance. If those segments of the insurance industry succeed in selling their plan or variations of it to the public, they will have succeeded in putting over a system they like best—a system, as suggested earlier, whereby they get to sell everyone two policies covering every accident instead of one: one policy for fault insurance and the other one for no-fault insurance. No wonder these segments of the industry are backing the Governor's proposal.

It is significant that this business of having *both* fault and no-fault claims applicable to every accident, large or small, directly contravenes the standards for no-fault insurance proposed recently by the Nixon Administration through the U.S. Department of Transportation. Once substantial no-fault insurance is instituted, said the Department of Transportation, "no person should recover for [pain and suffering] . . . unless he established that he suffered permanent [injury] . . . or that he incurred personal medical expenses . . . in excess of a rather high dollar threshold [emphasis supplied]." Governor Ogilvie's bill has no threshold at all, not *even* the overly modest one included in the Massachusetts law. On the other hand, the no-fault bills proposed, for example, by U.S. Senator Philip Hart (D. Mich.) and Professor Robert E. Keeton of the Harvard Law School and myself, as well as the criteria set forth by the U.S. Department of Transportation, all entail real *substitution* of expeditious no-fault insurance for cumbersome fault insurance, not adding no-fault insurance onto fault insurance and thereby retaining so many of the evils of the fault system.

In recommending his proposal to Governor Ogilvie, Illinois Insurance Commissioner James Baylor said, "I emphasize that what we propose will not mean any abrupt departure from the traditional American judicial system [emphasis supplied]."

cidents]. Rather does it call for a supplement to it." But the legal system applicable to smaller and medium size auto accidents has long been a disaster. We should not *supplement* it: we should *replace* it.

A no-fault bill accomplishing what Governor Ogilvie's bill does not—and covering property damage as well—is being introduced before the General Assembly by Representative Anthony Scariano (D. Park Forest).

STATEMENT OF JAMES MARSHALL, COUNSEL

James Marshall is a member of the New York Bar; counsel for the firm of Marshall, Bratter, Greene, Allison & Tucker; he is the author of *Law and Psychology In Conflict*, Bobbs-Merrill (1966), paperback edition Anchor Books (1969); Mr. Marshall has done research jointly with psychologists at New York University and the University of Michigan on problems of recall of witnesses; he is the joint author of an article entitled "Effects of Kind of Question and Atmosphere of Interrogation on Accuracy and Completeness of Testimony" that will appear in the May, 1971 issue of the *Harvard Law Review*.

There appear to be three threats in the proposals for no-fault insurance. First, there is a threat that the skills of many attorneys representing plaintiffs, insurance companies and other defendants will become obsolete and that consequently their income will be reduced. This is, of course, similar to the argument against the introduction of technological changes in industry. But should the public interest not be paramount? In a similar situation the public interest substituted Workmen's Compensation for the traditional, unfair system of employer's liability.

Second, there is a threat to the ideology of insurance companies because their thinking will have to be different and their actuarial calculations will have to change. But in view of the losses that have been incurred in automobile insurance for quite a number of years now, it should not be difficult to face this threat.

Finally there is a threat to the attitudes and value systems of a large part of the population, including lawyers and insurance companies. We have been brought up on the principle that he who does wrong—or even makes a mistake—should be punished and pay a penalty. It might have therapeutic values if the present system of reparations for motor vehicle accidents did reward the good and punish the bad. But it does not. Furthermore, a negligent driver does not feel punished when an insurance company foots the bill. Rather it is the careful drivers who justifiably feel punished, when their insurance premiums are raised, because the insurers are paying out money for the negligence of others.

Let me say at the outset that one need not swallow the whole no-fault pill in order to get the benefits of the proposal. I am sure it would be less bitter to many if, for example, some allowance were made for pain and suffering. It should be perfectly possible to work out a formula to compensate for pain and suffering in relation to the extent and duration of the injury.

Another matter troubling some, which adds to the bitterness of the pill, is the idea that people who are drunken drivers, or under the influence of drugs, or repeatedly reckless would nevertheless be "rewarded" by payments for their injury. But if they are injured somebody, and frequently the community, has to pay the penalty for their injury. The penalty, it seems to me, should not be to deprive them of funds needed to pay their doctors and their hospital expenses (which would otherwise fall upon the community), but to deprive them of the right to have a driver's license or to own a motor vehicle for x numbers of years.

PRESENT FAULT SYSTEM IS BASED ON FALSE ASSUMPTIONS

A major failing of the present fault system is that it is based upon a number of false assumptions. First, it is assumed that in an automotive action one party is at fault whereas neither party may actually be at fault. A study conducted a few years ago by Norman for the World Health Organization found: "... road accidents do not usually have a single 'cause'" and that "each individual accident is likely to have several causative factors . . . The search for single causes of accidents is usually likely to prove unproductive." (*Road Traffic Accidents*, 11 No. 12 World Health Organization Paper 19, 1962).

Furthermore, it cannot be said that if driving along the road one misjudges the speed of another car that this is negligence. Misperceptions are the natural course of events in our lives. This has been described in considerable detail in my book *Law and Psychology in Conflict* (Bobbs-Merrill 1966) in chapter I.

The second false assumption is that if the plaintiff has contributed in any way to the accident he is not entitled to recover. The only justification for the

contributory negligence principle seems to be that it carries out in a distorted form our punitive value system. It says that we must punish a man careless enough to have been hurt by another's carelessness and this exculpates the man who caused the damages. It results, however, in "appalling cases of incomplete coverage . . ." Daniel Moynihan, *Neat: A New Auto Insurance Policy*, N.Y. Times Mag. 26, 78 (Aug. 27, 1967).

In other words, what the present law says is that if neither party is at fault or if both parties are at fault, there can be no compensation for injuries sustained. This may have made sense in the horse and buggy or ox-cart eras but does it make sense today when almost everybody in a large community or who travels along a highway, whether as driver, occupant of a car or pedestrian, is likely to be involved in an automotive accident at some time in his life? What the no-fault insurance theory is saying is that injuries received as a result of automotive accidents should be insured as lives are (with the exceptions, of course, when someone commits suicide or intentionally maims himself).

Under a no-fault system such inequities would be eliminated. The harsh and unrealistic rule that excludes some victims from benefits would be discarded. A victim's right to compensation would endure regardless of whether or not he could find someone else to blame.

A third assumption is that, under the present system, the good will triumph and, thus, the "faultless" party will always win. However, experts agree that this is far from the case. Consider the following comment by Dean Prosser:

"The evidence given in personal injury cases usually consists of highly contradictory statements . . . estimating such factors as time, speed, distance and visibility, offered months after the event by witnesses who were never very sure just what happened when they saw it, and whose faulty memories are undermined by lapse of time, by bias, by conversations with others and by the subtle influence of counsel. Upon such evidence, a jury of 12 inexperienced citizens . . . are invited to . . . make the best guess they can as to whether the defendant, the plaintiff, or both were 'negligent', which is itself a wobbly and uncertain standard based upon the supposed mental processes of a hypothetical and non-existent reasonable man." W. Prosser, *Handbook of the Law of Torts* 12 (3rd ed. 1964).

In other words, it is assumed that the evidence that proves the righteous cause in an automotive accident case is reliable. However, all lawyers know that this is not a fact.

Furthermore, we perceive more inaccurately under stress than in normal situations. Under stress we do not recall fully and completely what has occurred. There are numerous psychological studies to the effect. Moreover, witnesses are subject to the influence of other witnesses and to the questions asked by counsel in preparation for and during the trial, even when counsel and witnesses are acting in good faith. These, too, distort recall.

Finally, as I have already mentioned, the assumption is that punitiveness will cure negligence. There is far from a one-to-one relationship between the two. There is no evidence that negligence law has any substantial effect on the conduct of drivers. A study by the American Insurance Association shows that less than 10% of the injuries in one-car accidents are associated with serious traffic violations and less than 5% in multi-car accidents. (A.I.A. Report at 16)

THE INEQUITIES OF THE FAULT LIABILITY SYSTEM

Under the present system approximately one out of every four persons suffering bodily injury receives no compensation either for out-of-pocket expenses, economic loss or pain and suffering. Two studies of statewide data in New York have confirmed that approximately 25% of automobile accident victims do not receive any compensation from the fault insurance system in New York State. One of these studies by F. Harwayne estimated that 22% of the victims got nothing from the present system. (*Automobile Basic Protection Costs Evaluated* *** 7, 1968) A further study undertaken at the request of the State Department of Insurance, by Jeffrey Lange, surveyed close to 11,000 claim records of bodily injury accidents. (*Report of Special Committee to Study and Evaluate the Kecton-O'Connell Basic Protection Plan and Automobile Accident Reparations* 1968) (hereinafter cited as A.I.A. Report) From these data it has been estimated that 29% of New York State victims receive no payment through the fault insurance system.

The amounts recovered are frequently unrelated to the severity of the injury. A victim who has suffered a great physical injury may receive proportionately

less than one who has suffered a minor one. This is so because in a typical small case it is worth more to the insurance company to dispose of the claim. The excess over economic loss is written off by the company as "general damages" or "pain and suffering." (American Mutual Insurance Alliance, *Statement on Automobile Accident Law and Automobile Insurance* 10 Nov. 21, 1969.) In larger cases, however, the claimant may be in greater need of certainty than the company. Hence such claimants are in a weaker bargaining position and are underpaid. (*Automobile Insurance . . . For Whose Benefit?*, A Report by the Ins. Dept. of N.Y.S. 29 1970) (hereinafter cited as Ins. Dept. Rep.) Thus, a survey taken by the U.S. Department of Transportation reveals that dissatisfaction with insurance settlements was greatest when claimants received compensation for serious physical injuries. (*Public Attitudes Toward Auto Insurance*, A Rep. of the Survey Research Center Inst. for Soc. Research—Univ. of Mich., Dept. of Trans. Auto Insurance Compensation Study at 59 (1970).)

The realities of the present system undermine the argument advanced by its supporters that "pain and suffering" is a humanitarian principle to be coveted in our law. Recovery for "pain and suffering" is no more than a tool with which the plaintiff's attorney may either drive a hard bargain out of court, or exploit for the purpose of attaining jurors sympathy to an exorbitant recovery in court. Consider the following:

"All this is not to say that pain is not real, or that money is of no use as a balm. But it does make clear that in the typical case under today's fault insurance system, 'pain and suffering' is a misnomer and an expensive one." (Ins. Dept. of Rep. 29.)

The present fault liability system is particularly oppressive to those who are poor. For example, an individual who is financially secure will be better able to absorb medical expenses and loss of wages over an extended period of time until he is finally compensated than a poor man. This is true whether the suit comes to trial or is settled. The poor person is generally under pressure to agree to a speedy settlement notwithstanding the fact that he would receive increased recovery had he been able to endure his economic pressures.

This has been well put by the late Judge Samuel H. Hofstadter and Robert Pesner:

"But can we say that the 'justice gap' did not weaken the bargaining position of many claimants? Are not many of the settlements based upon the immediate economic need of the claimant . . . rather than upon actual loss? And what of those who endure the extended wait? May they not say that 'justice delayed is justice denied'?" (A National Compensation Plan for Automobile Accident Cases, 22 Ass'n. of the Bar of the City of N.Y., No. 8, 615, 617, Nov. 1967.)

The distortion in recoveries under the fault system is another source of injustice. Victims of great economic injury receive proportionately less than victims suffering minor economic losses. A survey made by the American Insurance Association confirms that the total amount paid to settle a bodily injury claim averages 2.4 times the amount of the economic loss. However, the ratio is much higher where the economic loss is small and it diminished as the amount of economic loss increases. (A.I.A. Report at 16)

Whether by trial or settlement, what really happens is that the man who can afford to pay a negligence lawyer with great expertise and histrionic capacity will fare better than one who has a lawyer with less competence in this field. Furthermore verdicts, and therefore settlements, vary greatly for the same injury in different jurisdictions. Awards for pain and suffering, for example, tend to be far greater in metropolitan areas than in rural areas. The extent of a victim's pain and suffering is not contingent upon jurisdiction; yet, juries' standards of value often differ depending upon locality.

Both from a personal and social standpoint, lump sum payments may prove to be inequitable. Rehabilitation and loss of capacity to earn a living may be of short duration in some cases but a lifetime in others. When the lump sum has been exhausted the victim requiring long rehabilitation or whose injury is chronic will be without funds to meet his needs or become a charge on the community. (See, e.g., Professor Alfred Conrad, *Automobile Accident Costs and Payments: Studies in the Economics of Injury Reparation*, 147-49 (1964).)

In those cases where prolonged observation is necessary a no-fault system deals more adequately with the situation. This is because long term continuous payments rather than lump sum awards promote greater flexibility in determining the financial needs of a victim over an extended period. In the meantime, the injured person would receive reimbursement for his immediate medical expenses and loss of work.

COURT DELAYS AND CLOGGED CALENDARS

The present fault system causes an overwhelming burden upon the courts, resulting in long delayed settlements.

Ex-Senator Joseph D. Tydings points out:

"Today the average waiting period for personal injury suits in civil courts in major metropolitan areas is twenty-one months and in counties having a population of more than 750,000, exceeds twenty-nine months. In the Supreme Court of Rockland County, New York, the time from service of answer to trial is 64.6 months." (American Bar Association Journal 57, 1971, 154, 155)

Judgments or settlements long delayed deprive injured persons of compensation when they most need it. The disastrous effect of long, uncompensated periods was noted by Professor Maurice Rosenberg:

"[Studies] find . . . that the more seriously injured victims feel the pinch of delay and feel the weight of the full system in general very, very, heavily, that is, that they are very often left as economic derelicts, they suffer a great amount of privation and their economic lives are destroyed by this system. M. Rosenberg, *Meeting of N.Y. Governor's Committee on Compensating Victims of Automobile Accidents*, Transcript 82 84 (Feb. 29, 1968).

When calendars are clogged settlements too tend to be postponed. If you are out of work and if you have medical bills to pay, delays of years become unfair and intolerable. They can be a prime cause for discontent with and contempt of law.

Surveys made for the year 1969 show that the average delay in paying automobile personal injury liability claims is well over a year in New York State (Ins. Dept. Rep. 20). On the average, claimants wait 15.8 months for recovery (Id. at 20 N.N. 27). The average large claim encounters greater delays than small claims. Often wage claims are not satisfied until the expiration of a 4 to 5 year period. (Id. at 21). During this period the injured party receives nothing under the present system.

Surveys also show that for non-litigated claims 36% remained unpaid after one year and 23% after two years (Dept. of Transp. Closed Claim Survey-N.Y., Table 131).

The Insurance Department statistics (N.Y.S. Ins. Dept. 1968 Loss and Expense Ratios 118) show that the situation is growing worse and that the proportion of unpaid claims after periods of two to five years from the date of the accident, is increasing. The following Table indicates this:

RATIO OF LOSSES OUTSTANDING TO LOSSES INCURRED

| Policy year | After 2 years | After 3 years | After 4 years | After 5 years |
|-------------|---------------|---------------|---------------|---------------|
| 1959..... | .41 | .27 | .17 | .16 |
| 1960..... | .42 | .28 | .18 | .10 |
| 1961..... | .44 | .29 | .19 | .12 |
| 1962..... | .44 | .30 | .19 | .12 |
| 1963..... | .46 | .31 | .21 | .13 |
| 1964..... | .45 | .32 | .23 | |
| 1965..... | .47 | .34 | | |
| 1966..... | .47 | | | |

The number of cases that do reach trial, although proportionately small, are mammoth in number. In discussing this problem, Chief Justice Burger has suggested that personal injury cases which now make up the largest category of civil cases be entirely eliminated (Fred P. Graham, *Burger Suggests Judicial Changes*, N.Y. Times, Nov. 15, 1970 Col. 1, p. 32). The no-fault system is the fairest way of reducing this large backlog of cases.

COSTS OF THE SYSTEM

If the courts were not loaded with motor vehicle cases judges, their secretaries, courtrooms and their factotums could be utilized to dispose of the dangerous backlog of untried criminal cases. It would not then be so necessary to keep adding judges or crowding courts to the great expense of the State.

The cost of attorneys' fees would also be reduced under a no-fault system. And, of course, there is the rub so far as lawyers are concerned. A no-fault system presents them with a conflict of interest.

Today, out of every insurance dollar spent, insurance companies and adjusters use up 33 cents; lawyers and claim investigators 23 cents. The 33 cents are

of every premium dollar may be considered operating costs. The remaining 44 cents is returned to injured parties as a class. Of this 44 cents, 21.5 cents goes to compensate victims for pain and suffering, leaving 22.5 out of the premium dollar as compensation for the net economic losses of the accident victim. Furthermore, 8 cents out of the 22.5 goes to compensate economic losses which have already been reimbursed from another source. R. Keeton, *Compensation Systems: The Search for a Viable Alternative to Negligence Law*, 33 (1969 Supp. 2 Seavy, Keeton and Keeton's Cases and Materials on Torts, 2d ed. 1964)

The New York State Insurance Department estimates considerable savings in premiums under a no-fault plan. For example, under statutory coverage in Brooklyn, the highest rated premium territory in the State, the present cost for two retired persons would be 186. The proposed rate would be 67. In the northern counties of New York, which have the lowest premium rating, for a family of two retired persons the present rating would be 73 and under the proposed system, 24. Similar relationships exist for larger families and where other variables exist. (Ins. Dept. Rep., Appendix A, pp. 135, 136, 137. See also Appendix B, Tables I, II and III, pp. 132-146).

When one considers that the average attorney's fee is about one-third of the recovery and that the plaintiff has been paying his own insurance premiums over the years, one gets the feeling that even when he recovers he is in much the same position as the parties to *Jarndyce and Jarndyce* in Dicken's *Bleak House* where fees and expenses devoured the estate.

In conclusion, our present fault system of compensation is based on false assumptions, is inequitable, results in unfair and unreasonable delays which deprive an injured person of compensation when he most needs it, clogs the courts and is expensive, socially as well as economically. Therefore, while a no-fault plan may require further refinement, in principle the system is sound from practical, equitable and economic viewpoints. A no-fault system could free the courts for more important business than managing calendars and trying cases that depend upon unreliable evidence and are determined, for the most part, by the skill of counsel, the idiosyncrasies of juries and the venue of the case.

STATEMENT OF NORMAN L. ROGERS, PRESIDENT, LAWYER REFORM OF THE UNITED STATES

I do not pretend to represent a large number of people or powerful economic interests. The organization I represent is very new and very small. We want to improve the honesty and efficiency of the legal processes.

This country needs no-fault insurance. Not only because it is a sensible improvement, but because we badly need demonstrations that the unorganized, public interest can win out over organized, vested interest.

The legal profession has no moral right to expect that the automobile insurance system shall be structured primarily for its own benefit. The special pleading of the lawyers should be rejected.

A larger issue at stake here is whether we can afford the luxury of choosing inefficiency over efficiency. In an editorial in the May 14, 1971 issue of *Life* magazine, it was pointed out that spendable real income declined during the last five years for the average white and blue collar worker. Our standard of living is directly related to the efficiency of our economic activity. The editors of *Life* stated: "... we certainly can improve on such things as an automobile insurance system that pays out only 42 cents in liability benefits for every dollar of premiums collected."

Make-work is not economically productive. Not even when it is done by lawyers and insurance claims adjusters.

STATEMENT OF THE NATIONAL ASSOCIATION OF MUTUAL INSURANCE COMPANIES

The National Association of Mutual Insurance Companies, as a professional trade organization, has a total membership of over 1,000 mutual insurance companies in the United States and Canada.

The problems facing the private insurance industry, Federal and State Government in the transportation field, particularly with the automobile, would have probably been beyond the imagination of the first automobile manufacturer and insurance underwriter, yet these problems are very real today. The solution to these problems does not lie in the hurling of accusations between manu-

facturers, repair shops, insurance companies, the public and, yes, regulators and lawmakers.

The automobile manufacturers feel that the automobiles they produce, with all of their power and cosmetic design, are what the public wants. The automobile repairman feels he has become a "replacement" man, rather than being able to repair. The insurance company has become a maintenance contractor, rather than a protector of the public against financial disaster. The public becomes outraged at having to pay the attendant costs but yet expects to be reimbursed for the first dollar, and many times an inflated first dollar, of every type loss. The regulator and legislator are caught on the horns of dilemma, i.e. protecting the public against abuses, real or otherwise, and making sure the insurance company remains solvent to meet its financial obligations, present and future.

These hearings, hopefully, are not to air more accusations but to bring responsible people together so that responsible solutions can be achieved.

The review of past explorations in the area of the automobile insurance reparations system would serve no useful purpose at this time. To find a solution by using the experience of the past and projecting the results into the future must then be the prime goal.

The National Association of Mutual Insurance Companies feels strongly that an expansion of a first party reparations system in the automobile insurance field is feasible, however, we do not feel that the complete abolition of the tort liability system is the complete answer. A melding of a first party system with tort liability has more merit than completely eliminating a tried and true system (tort) for an unknown plan. If indeed the public wants a reform in the reparations system, then we think it is incumbent on the insurance industry to act responsibly instead of reacting by going off in many different directions and solving nothing.

Our Association has officially adopted the above position as evidenced by the attached addendum A. To expand the first party concept, we recommend a first party injury recovery of \$5,000.00 with the right of recovery through the tort system for the serious injury caused by flagrant violators of the accepted laws of our society. The retention of Uninsured Motorists Coverage should be continued so that the responsible public would be protected against the relatively small percentage of the motoring public that is irresponsible. In expanding the first party concept as respects Bodily Coverage to \$5,000.00 immediate economic losses would be recovered and thus eliminate the need for separate Medical Payments Coverage. Further exploration is possible in the Property Damage and Collision Coverages regarding the expansion of first party recovery. The Property Damage Coverage could also include the first party concept by applying reasonable deductibles when two or more motor vehicles are involved in an accident. The deductible, of course, would not apply to damage to property other than motor vehicles but would be paid without regard to fault only as respects stationary objects such as buildings, telephone poles, etc. By expanding first party coverage to Property Damage in this manner, the separate Collision Coverage could be eliminated. Thus the automobile insurance policy would become an indivisible package of Bodily Injury, Property Damage and Uninsured Motorists Coverages. Optional coverages such as Comprehensive, Additional Death Benefits, Increased Limits, Towing and Labor, etc. could be offered.

Department of Transportation Secretary Volpe on March 18, 1971 recommended that a period of time be provided for the State Governments to develop and implement plans which would provide a first party reparations system. Secretary Volpe is to be commended for this position in view of the ever increasing drive for more and more Federalism and socialistic trends that have been developing in the past few years.

The National Association of Mutual Insurance Companies supports Secretary Volpe's recommendation and pledges its support to those who are willing to work responsibly for a solution to the nation's automobile problems of today and tomorrow.

IN THE MATTER OF : NO FAULT AUTOMOBILE PROPOSALS

The National Association of Mutual Insurance Companies continues to subscribe to a system by which parties injured in automobile accidents are reimbursed for damages sustained on the basis of fault, and to the position that the present system is the best.

fault should be held responsible for injuries and damages sustained as a result thereof.

The Association recognizes, however, that many persons at fault receive injuries in automobile accidents and that a system providing for reimbursing such individuals, even though at fault, for their medical, hospital, funeral bills and loss of earnings has merit. It is the position of the Association that such loss to a person at fault can best be handled by reasonable expansion of a first party insurance program for payment to such injured party and at the same time retain the fault concept.

The Association further supports both of these programs and urges that the same be carried out by the inclusion of a fair and reasonable premium charge for such coverages.

STATEMENT OF JOSEPH A. BEIRNE, PRESIDENT COMMUNICATIONS WORKERS OF AMERICA

The 92d Congress has an opportunity to pass legislation which will eradicate a great injustice against millions of Americans, and at the same time assure these millions that government is responsive to the individual American consumer.

This legislation is the package that has been introduced in the Senate and the House (S. 945, S. 946, S. 947, S. 948, S. 976, H.R. 4994, H.R. 4995, H.R. 4997, H.R. 4998, H.R. 4999) to establish no-fault auto insurance nationally, and to develop safer cars and honest repair practices.

Millions of Americans, including the hundreds of thousands who are members of the Communications Workers of America, have been seeing only continually rising premium prices, accompanied by dismal delivery of auto insurance protections. They need the benefits which this legislation would provide and—just as badly—they need a demonstration on the part of Congress which shows them that government means more than frustration and taxation.

The elements needed to satisfy those purposes are in the package introduced by Senators Hart and Magnuson, and Representatives Moss, Dingell and Carney.

This is an opportunity Congress should seize.

It is also an opportunity which the Nixon Administration should seize, especially since that Administration has spoken frequently in terms of enhancing the life of the American individual and returning political power to the people.

Establishing no-fault auto insurance on a national basis would be as clear and vivid a demonstration of the rights of the individual consumer over the powerful blocks of lawyers who specialize in auto injuries and the insurance companies, but the Administration, by its Congressional testimony, has shown no willingness to stand with the individual consumer.

Treasury Secretary Volpe's testimony, has said, in effect, that no-fault auto insurance is a good idea but let's allow it to languish in the state legislatures for a while, where it can be stalled easily, so that those who are now milking the consumer's auto insurance dollar can continue to gorge themselves.

It would be redundant for me to go into a detailed discussion of the elements of no-fault—the Congress has the massive study of the Department of Transportation, and other information which shows that less than 50 percent of personal injury premiums go back to the injured persons, but are eaten up by legal and insurance selling expenses.

The Congress should also be aware that no-fault has been in operation in Puerto Rico for more than a year and a half, and that it has been even more successful than anticipated. All of the scare cries that have come from the opponents of no-fault auto insurance have been dispelled by the evidence of the Puerto Rico experience.

Of course, this will not prevent opponents from buying advertisements to try to scare the public into believing that their right to sue will be taken away if no-fault passes, and other false claims.

Perhaps the most effective counters to the falsehoods of the opponents would be constant reiteration of the following facts:

Of 220,000 personal injury lawsuits in 1968, the victims netted \$700 million and the lawyers netted \$600 million.

Under no-fault, the victim would be paid for the economic loss, but could still sue for additional pain and suffering.

This issue, like so many others, boils down to a matter of educating the people. With auto insurance, the knowledge that it is a problem is established. Many

people, additionally, are finding out that no-fault is the solution, but more and more must be informed.

But the public must also be informed about the tactics of the segments of society which want to maintain the status quo which they find so lucrative—the phoney claims, the phony ads. Congressional hearings can show this.

All of us who are interested in seeing an America where the individual can feel secure in knowing that his government is responsive to him and to his needs should continually make every effort possible to show that the opponent's of no-fault auto insurance are also opponents of responsive government.

STATEMENT OF THE AMERICAN ASSOCIATION OF RETIRED PERSONS NATIONAL
RETIRED TEACHERS ASSOCIATION

The American Association of Retired Persons and The National Retired Teachers Association support the principle of no-fault insurance whereby accident victims may recover losses from their own insurers without undue delay and without regard as to who is at fault. We, therefore, request that State insurance laws be revised wherever necessary to introduce no-fault personal injury automobile insurance. We ask that no-fault coverage be made mandatory for every motor vehicle owner and that all insurance companies be required to sell no-fault policies to all licensed drivers. As Associations representing over 3 million elderly, we feel that no-fault insurance is especially important to the elderly who, as a class, have proved to be safe drivers, but who in too many cases are being denied insurance or otherwise discriminated against simply because of age.

We favor the implementation of no-fault at the State level to encourage experimentation on a State-by-State basis in order that this new concept may be adequately developed and perfected.

At the same time we urge legislation by the U.S. Congress providing certain minimum no-fault standards which each State must achieve within the next few years. The standards must include:

1. The benefits of Medicare should be utilized by those receiving social security and companies should be permitted to sell no-fault insurance as excess benefits over those provided by Medicare, at substantially lower premium rates.

2. Maximum benefits should be high enough to cover all medical costs in the vast majority of cases. The right to tort action should be limited to cases involving serious misconduct or serious injuries. We believe that a maximum benefit of \$5,000 and a medical expense threshold of \$2,000 (in determining the right to tort) will achieve these desirable objectives.

3. Compulsory automobile insurance as respects no-fault personal injury protections, residual bodily injury liability insurance and property damage liability insurance.

In the event that any State or States do not enact no-fault auto insurance programs within a reasonable period of time, the Federal Government should preempt their rights to regulate the automobile insurance business.

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

WEDNESDAY, OCTOBER 13, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to notice, at 11:10 a.m., in room 5110, New Senate Office Building, Hon. Philip A. Hart presiding.

Present: Senators Hart, Cotton, Baker, Cook, Stevens, and Beall. Senator HART. The committee will be in order.

Hearings are resuming on legislation designed to correct the present automobile insurance system to the extent there are inefficiencies and inequities in it today.

May I, for the record, read the letter which was submitted by the ranking minority member, Senator Cotton, along with Senator Baker and Senator Cook, which prompted these hearings. It is addressed to Senator Magnuson as chairman of the Commerce Committee.

**UNITED STATES SENATE COMMITTEE ON COMMERCE,
September 28, 1971**

**HON. WARREN G. MAGNUSON,
Chairman, Committee on Commerce,
U.S. Senate,
Washington, D.C.**

DEAR MR. CHAIRMAN: It is our understanding that the Committee will shortly take up in Executive Session Committee Print One of S. 945, the No-Fault Insurance bill, which was prepared by the Staff and has been made available to members of the Committee.

In view of the extensive changes which have been incorporated in Committee Print One, both in the fundamental concept and the cost of coverage, we feel that further hearings would be advisable. We have had correspondence from numerous individuals and companies directly involved expressing a similar concern and a desire to testify at such hearings. We will, of course, be pleased to make copies of this correspondence available to you.

We request, therefore, a continuation of hearings on this bill to fully develop the issues raised by Committee Print One of S. 945.

**NORRIS COTTON,
HOWARD H. BAKER,
MARLOW W. COOK,
U.S. Senators.**

The chairman of the committee, Senator Magnuson, in response has scheduled these hearings.

I am sure we will have constructive comments on this committee print as a result thereof.

Senator Cotton.

Senator COTTON. Mr. Chairman, I have a letter dated October 6, 1971 from Secretary of Transportation Volpe relative to committee print No. 1 of S. 945. I would like unanimous consent to insert the letter at this point in the record.

Staff member assigned to these hearings: S. Lynn Sutcliffe.

Senator HART. Without objection.
(The letter follows:)

THE SECRETARY OF TRANSPORTATION,
Washington, D.C., October 6, 1971.

HON. NORRIS COTTON,
U.S. Senate,
Washington, D.C.

DEAR SENATOR COTTON: You have asked for the comments of the Department of Transportation on the Committee Print of S. 945, the National No-Fault Motor Vehicle Insurance Act.

As you know, the Administration, drawing on the results of the Department of Transportation's Auto Insurance and Compensation Study, testified before your Committee last March on the general subject of reform of the auto accident reparations system. In essence, the Administration concluded that the existing system should be changed promptly to predominant reliance on first party, no-fault insurance, but that this change should take place at the State level with the States being free to experiment with various types of no-fault reforms to the ultimate benefit of all.

Our views on the need for reform and the direction that reform should take have not changed since last March. Moreover, the basic desirability of approaching reform through State action seems even clearer today than it did six months ago. At that time, only one State, Massachusetts, had begun the shift towards a first party, no-fault system; since then States have been acting at the rate of one a month, and the prospects for an acceleration of that pace in the months ahead seem far brighter than anyone would have predicted six months ago. In view of this progress and this prospect, we do not believe that enactment of S. 945, which would deprive all States the benefits of experimentation with different no-fault approaches, is either necessary, or wise, or likely to produce the optimum result in the end.

Moreover, the National Conference of Commissioners on Uniform State Laws has joined with the Department to draft legislation embracing the Administration's no-fault reform principles and designed for implementation at the State level. The Nation's Governors, when they met recently in Puerto Rico, strongly endorsed the concept of State by State action in this area and took special notes of the work of the Uniform Law Commissioners. Surely, it would be hard to argue that there is not a strong pro-no-fault reform tide running in the States today. We believe that they should be given a fair opportunity to reform their own reparations system before we resort to Federal pre-emption.

It should also be noted that the proponents of Federal action now have been unable to collect must support. Favoring the Administration's position of State by State action were all of the insurance industry, all of the agents' associations, the bar, the National Association of Insurance Commissioners and, as mentioned earlier, the Governors. At least for the foreseeable future, the Administration's position would seem to be able to command the support of the overwhelming majority of the interested constituencies of this problem.

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

Sincerely,

JOHN A. VOLPE

Senator COTTON. May I say that the general position of Secretary Volpe, and to that extent perhaps representing the administration's viewpoint, is that since his last communication with this committee, which was last March, States have enacted various forms of so-called "no-fault" insurance at the rate of about one State per month. I believe now there are seven States plus Puerto Rico that have enacted some form of no-fault insurance.

The Nation's Governors when they met took the position that reform is needed, but they want the States to have further opportunity to enact that reform at the State level before the Congress intervenes with Federal legislation.

The concluding paragraph of Secretary Volpe's letter says:

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

May I say, Mr. Chairman, that my own feeling, independent of any expression by the Department of Transportation or by the administration is this: Only Massachusetts and perhaps Puerto Rico have had any form of "no-fault" insurance in effect long enough to gain experience from its application. I have a feeling that some reform such as is generally referred to as "no-fault" insurance is probably bound to come.

I feel, however, that when you have States adopting various approaches that the wisest course is to wait long enough so that the Congress can avail itself of the experience and of the testing of this approach to insurance in whatever various forms may be adopted by the States before turning to Federal law.

It is noteworthy that the action taken by the States thus far aims for the same objective but through different modes and moods of approach.

So, not to take up the time of witnesses and the time of the committee, I feel very strongly that legislation may be necessary in the future, and that reform of this type seems to me very desirable, but I don't believe we should act until we get enough time to observe the workings of these various State approaches and other approaches, because many other States have statutes under consideration.

I thank you, Mr. Chairman.

Senator HART. The point made by Senator Cotton just now is one that he has with conviction voiced earlier. Knowing the reach of his voice, I am sure that the committee will hear it again.

Perhaps we can resolve prudentially and wisely the course that the committee should take.

Senator BAKER. Mr. Chairman, I would like to express my appreciation to Chairman Magnuson for scheduling these 2 days of hearings on the committee print of S. 945. I am sure that the testimony we receive today and tomorrow will enable us to analyze the merits and deficiencies of this bill objectively and with careful regard for the impact this legislation would have on the automobile accident reparations system.

The modifications in S. 945 which are made by the committee print are very basic and very broad. At the hearings held, several witnesses addressed themselves to the problem of coverage provided by the bill in its original form.

I note that in the revision most, if not all, of the gaps are closed, with the effect that the tort system of reparations is generally abrogated. But while the print addressed itself to these gaps,

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

WEDNESDAY, OCTOBER 13, 1971

**U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.**

The committee met, pursuant to notice, at 11:10 a.m., in room 5110, New Senate Office Building, Hon. Philip A. Hart presiding.

Present: Senators Hart, Cotton, Baker, Cook, Stevens, and Beall. Senator HART. The committee will be in order.

Hearings are resuming on legislation designed to correct the present automobile insurance system to the extent there are inefficiencies and inequities in it today.

May I, for the record, read the letter which was submitted by the ranking minority member, Senator Cotton, along with Senator Baker and Senator Cook, which prompted these hearings. It is addressed to Senator Magnuson as chairman of the Commerce Committee.

**UNITED STATES SENATE COMMITTEE ON COMMERCE,
September 28, 1971**

**HON. WARREN G. MAGNUSON,
Chairman, Committee on Commerce,
U.S. Senate,
Washington, D.C.**

DEAR MR. CHAIRMAN: It is our understanding that the Committee will shortly take up in Executive Session Committee Print One of S. 945, the No-Fault Insurance bill, which was prepared by the Staff and has been made available to members of the Committee.

In view of the extensive changes which have been incorporated in Committee Print One, both in the fundamental concept and the cost of coverage, we feel that further hearings would be advisable. We have had correspondence from numerous individuals and companies directly involved expressing a similar concern and a desire to testify at such hearings. We will, of course, be pleased to make copies of this correspondence available to you.

We request, therefore, a continuation of hearings on this bill to fully develop the issues raised by Committee Print One of S. 945.

**NORRIS COTTON,
HOWARD H. BAKER,
MARLOW W. COOK,
U.S. Senators.**

The chairman of the committee, Senator Magnuson, in response has scheduled these hearings.

I am sure we will have constructive comments on this committee print as a result thereof.

Senator Cotton.

Senator COTTON. Mr. Chairman, I have a letter dated October 6, 1971 from Secretary of Transportation Volpe relative to committee print No. 1 of S. 945. I would like unanimous consent to insert the letter at this point in the record.

Staff member assigned to these hearings: S. Lynn Sutcliffe.

Senator HART. Without objection.
(The letter follows:)

THE SECRETARY OF TRANSPORTATION,
Washington, D.C., October 6, 1971.

HON. NORRIS COTTON,
U.S. Senate,
Washington, D.C.

DEAR SENATOR COTTON: You have asked for the comments of the Department of Transportation on the Committee Print of S. 945, the National No-Fault Motor Vehicle Insurance Act.

As you know, the Administration, drawing on the results of the Department of Transportation's Auto Insurance and Compensation Study, testified before your Committee last March on the general subject of reform of the auto accident reparations system. In essence, the Administration concluded that the existing system should be changed promptly to predominant reliance on first party, no-fault insurance, but that this change should take place at the State level with the States being free to experiment with various types of no-fault reforms to the ultimate benefit of all.

Our views on the need for reform and the direction that reform should take have not changed since last March. Moreover, the basic desirability of approaching reform through State action seems even clearer today than it did six months ago. At that time, only one State, Massachusetts, had begun the shift towards a first party, no-fault system; since then States have been acting at the rate of one a month, and the prospects for an acceleration of that pace in the months ahead seem far brighter than anyone would have predicted six months ago. In view of this progress and this prospect, we do not believe that enactment of S. 945, which would deprive all States the benefits of experimentation with different no-fault approaches, is either necessary, or wise, or likely to produce the optimum result in the end.

Moreover, the National Conference of Commissioners on Uniform State Laws has joined with the Department to draft legislation embracing the Administration's no-fault reform principles and designed for implementation at the State level. The Nation's Governors, when they met recently in Puerto Rico, strongly endorsed the concept of State by State action in this area and took special notes of the work of the Uniform Law Commissioners. Surely, it would be hard to argue that there is not a strong pro-no-fault reform tide running in the States today. We believe that they should be given a fair opportunity to reform their own reparations system before we resort to Federal pre-emption.

It should also be noted that the proponents of Federal action now have been unable to collect must support. Favoring the Administration's position of State by State action were all of the insurance industry, all of the agents' associations, the bar, the National Association of Insurance Commissioners and, as mentioned earlier, the Governors. At least for the foreseeable future, the Administration's position would seem to be able to commend the support of the overwhelming majority of the interested constituencies of this problem.

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

Sincerely,

JOHN A. VOLPE.

Senator COTTON. May I say that the general position of Secretary Volpe, and to that extent perhaps representing the administration's viewpoint, is that since his last communication with this committee, which was last March, States have enacted various forms of so-called "no-fault" insurance at the rate of about one State per month. I believe now there are seven States plus Puerto Rico that have enacted some form of no-fault insurance.

The Nation's Governors when they met took the position that reform is needed, but they want the States to have further opportunity to enact that reform at the State level before the Congress intervenes with Federal legislation.

The concluding paragraph of Secretary Volpe's letter says:

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

May I say, Mr. Chairman, that my own feeling, independent of any expression by the Department of Transportation or by the administration is this: Only Massachusetts and perhaps Puerto Rico have had any form of "no-fault" insurance in effect long enough to gain experience from its application. I have a feeling that some reform such as is generally referred to as "no-fault" insurance is probably bound to come.

I feel, however, that when you have States adopting various approaches that the wisest course is to wait long enough so that the Congress can avail itself of the experience and of the testing of this approach to insurance in whatever various forms may be adopted by the States before turning to Federal law.

It is noteworthy that the action taken by the States thus far aims for the same objective but through different modes and moods of approach.

So, not to take up the time of witnesses and the time of the committee, I feel very strongly that legislation may be necessary in the future, and that reform of this type seems to me very desirable, but I don't believe we should act until we get enough time to observe the workings of these various State approaches and other approaches, because many other States have statutes under consideration.

I thank you, Mr. Chairman.

Senator HART. The point made by Senator Cotton just now is one that he has with conviction voiced earlier. Knowing the reach of his voice, I am sure that the committee will hear it again.

Perhaps we can resolve prudentially and wisely the course that the committee should take.

Senator BAKER. Mr. Chairman, I would like to express my appreciation to Chairman Magnuson for scheduling these 2 days of hearings on the committee print of S. 945. I am sure that the testimony we receive today and tomorrow will enable us to analyze the merits and deficiencies of this bill objectively and with careful regard for the impact this legislation would have on the automobile accident reparations system.

The modifications in S. 945 which are made by the committee print are very basic and very broad. At the hearings held last spring, several witnesses addressed themselves to the problem of gaps in the coverage provided by the bill in its original form.

I note that in the revision most, if not all, of these gaps are closed, with the effect that the tort system of reparations is virtually abrogated. But while the print addressed itself to eliminating these gaps,

it may have created other problems with cost and with premium cost distribution. These are questions which will have to be answered, and which I am sure will be answered, today and tomorrow .

Many of the witnesses whose names I see on the witness list testified last spring at the initial hearings on S. 945. At that time many of these witnesses stated basic and philosophical aversions to a no-fault program for a variety of reasons. These witnesses have been cautioned and directed to limit their testimony during these hearings to the specific issues generated by the changes embodied in Committee Print No. 1 of S. 945. It will be understood that their testimony, therefore, is an addendum to their earlier statement and, unless they so state, does not reflect any retreat from, or modification in, their basic position with regard to no-fault insurance.

I think this understanding will obviate the need for reelaboration of these basic positions and will enable us to deal more incisively with the issues which prompted Senators Cotton, Cook, and myself to request these hearings.

LETTER OF TRANSMITTAL

U.S. SENATE,
COMMITTEE ON COMMERCE,
September 15, 1971.

To Members of the Committee on Commerce, U.S. Senate:

Transmitted herewith is a staff analysis and the text of Committee Print No. 1 of the National No-fault Motor Vehicle Insurance Act, (S. 945).

This analysis will be helpful when the committee commences its consideration of this matter later this month.

WARREN G. MAGNUSON,
Chairman.

(iii)

STAFF ANALYSIS OF COMMITTEE PRINT 1 OF S. 945, THE NATIONAL NO-FAULT MOTOR VEHICLE INSURANCE ACT

Description

Committee Print 1 would create an essentially restructured automobile insurance reparations system. Tort liability arising out of automobile accidents would be eliminated, and insurance benefits to pay for losses arising out of automobile accidents would be paid without regard to fault. A person injured in an auto accident would seek reparations from his own insurance company (first-party insurance) or the insurance company of the owner of the vehicle in which he was a passenger. An injured pedestrian would seek compensation from an insurance company covering any vehicle which caused injury to him.

General effect:

Tort liability abolished.

System of first-party insurance established.

The bill would require every owner who operates a motor vehicle on the public roadways of any State to take out a basic insurance policy to cover his own losses when operating his vehicle, losses of any other driver or passenger of his vehicle, and losses of any pedestrian that is injured in an accident involving his vehicle. In addition, such basic insurance policy would cover losses incurred if a vehicle caused damage to any property other than a motor vehicle in use. For example, if a vehicle struck a legally parked car, the policy covering the vehicle would pay for damage to the parked car.

Applies to all owners.

To assure the availability of such mandatory insurance policies, the bill would require every insurance company doing business in a particular jurisdiction and writing auto insurance to accept every insurance applicant who has a valid driver's license and who pays a premium based upon an applicant's proper classification. Cancellation of the basic policy would be prohibited unless the policyholder had failed to pay the premium or had had his license revoked.

All auto insurers must provide coverage.

The phrase "qualifying no-fault policy" is used in Committee Print 1 to describe the mandatory insurance policy which every owner of a motor vehicle must have as a precondition to operating his vehicle. The qualifying no-fault policy would provide certain benefits to the policyholder, members of his family, and people injured in an automobile accident in which his vehicle was involved (who were not occupants of another vehicle.)

"Qualifying no-fault policy" defined.

Broad benefits would be paid to auto accident victims by insurers writing qualifying no-fault policies. All medical and rehabilitation costs would be paid by the insurer issuing the qualifying no-fault policy. In addition, all wage loss after income taxes would be paid until such time as the injured person could resume available and appropriate gainful activity. There is, however, a thousand dollar per month limitation on the wage replacement provisions of the qualifying no-fault policy. For those people who earn more than a thousand dollars per month, a provision in the bill would permit them to purchase greater income replacement protection. Benefits under a qualifying no-fault policy would also be paid for loss of future anticipated earnings or for impairment of earning capacity resulting from injuries sustained in an automobile accident.

Mandatory benefits to those injured.

A qualifying no-fault policy would also provide benefits to pay for any services that an injured person would have performed for his or her own benefit, or the benefit of the family, but for the injury.

For example, a housewife suffering a back injury which prevented her from doing normal housework would receive benefits to pay someone to clean her house on a regular basis until she recovered from her injury.

A qualifying no-fault policy would also pay benefits to any owner of property (other than a motor vehicle in use) which is damaged as a result of an auto accident involving the policyholder's vehicle. For example, if a vehicle struck a picket fence after swerving off the road because of a blow-out, the insurance company covering the vehicle would pay the owner of the picket fence for its repair. Likewise, if that vehicle swerved off the road and struck a parked car, the insurance company would pay for the damage to the parked car. But if vehicles in use were involved in an accident, the owners of such vehicles would have to look to their own insurance companies for recovery of benefits if they had elected to buy such coverage.

Finally, a qualifying no-fault policy would pay for any loss (tangible or intangible) exceeding those described above suffered by an occupant of the insured's motor vehicle, or pedestrian struck by such a vehicle, if such injured person did not own a motor vehicle or was not a spouse or dependent of a motor vehicle owner. In other words, this coverage would provide excess economic loss and pain and suffering protection for those people not given the opportunity to purchase the coverage described below.

In addition to the benefits provided under a mandatory qualifying no-fault policy, there are other benefits which the insurers of such policies would have to offer but which the policyholder could choose to take or not as he wished. Committee Print 1 would require insurers of qualifying no-fault policies to offer collision insurance to pay for property damage to the policyholder's automobile. The policyholder could buy such insurance and select whatever deductible level he wished.

Optional coverage.

Insurers of qualifying no-fault policies would have to offer policyholders two other types of coverage: 1) coverage to pay for tangible loss in excess of that provided by the qualifying no-fault policy, and 2) coverage to pay for intangible loss (pain and suffering, inconvenience, loss of enjoyment of life) measured by the State tort law that would have been applicable to the accident had that law not been preempted by the bill. A qualifying no-fault policyholder could elect to buy either or both coverages to protect himself, his spouse, and any dependents from such loss.

Committee Print No. 1, in effect, makes available to all the motor-ing public all the benefits that the present automobile reparations system now provides to the accident victim who is not found negligent or contributorily negligent and who is injured by someone who is found negligent and is fully insured up to the extent of the loss suffered by the accident victim. However, because insurance against loss in excess of that provided under the qualifying no-fault policy is not necessary for the economic well-being of an automobile accident victim or the family of such victim, the insurance buyer is given the option to buy such additional coverage if he so chooses. The controversy over whether the public wants to recover for intangible losses would be resolved by free market forces rather than legislative determination.

Benefits of existing reparations system retained.

Benefits which an insurer is required to pay under a qualifying no-fault policy would be primary—the amount paid would not be reduced by any benefits from other sources paid to cover the same loss—unless collateral benefits were provided by public health insurance or by some private insurance or plan which specifically provided that its benefits were to be primary to the qualifying no-fault policy benefits. If a person had collateral benefits which were primary, the insurer

Relationship of no-fault insurance to other insurance coverages.

of the qualifying no-fault policy would be required to give that person a standardized rate reduction reflecting the amount of his primary collateral benefits. This arrangement would accomplish two purposes: 1) it would assure compatibility of auto insurance reform legislation with health insurance reform legislation; and 2) it would allow a person to choose his source of insurance benefits and avoid duplicative payments of premiums.

Any disputes between an insurer and a policyholder which could not be resolved by negotiation could be resolved in a formal court proceeding in which the attorney fees of the policyholder are paid by the insurer and thus the insurance mechanism generally. For example, if the insurer refused to pay a wage replacement claim arguing that the policyholder was able to return to work, the policyholder could retain an attorney to pursue his claim for continued periodic benefits. The policyholder's attorney would be compensated by the insurer whether the court supported the policyholder's claim or not unless the court determined that such compensation was inappropriate or that the claim was fraudulent, frivolous, or excessive. No benefits for economic loss paid under a qualifying no-fault policy could be used to compensate an attorney. However, in disputes concerning policy provisions governing other than economic loss where reasonable attorneys' fees are not provided, an attorney would be permitted to enter into a contractual or contingent fee arrangement with a policyholder. Any contingent fee arrangement would be limited to 25% of the gross recovery of the policyholder, or a lesser amount at the discretion of the court.

Role for attorneys.

Litigation arising under the qualifying no-fault policy would be conducted in state courts of competent jurisdiction. Federal court jurisdiction would be limited to cases or controversies meeting the jurisdictional requirements of section 1332 of title 28 of the United States Code, namely diversity of parties and an amount in controversy exceeding \$10,000.

State courts jurisdiction preserved.

In the event that a person is injured or killed in an automobile accident in a vehicle or by a vehicle which is uninsured (and that person is not responsible for the fact that the vehicle is uninsured) then the victim may seek recovery from an assigned claims plan which would be required to be established in each State. The assigned claims plan would work very much like the present post-insolvency assessment plans. In the event a person with a legitimate claim had no insurance company to turn to (because the vehicle was uninsured or because the insurance company was insolvent) he could file his claim with the assigned claims plan which would be financed by assessing insurance companies doing business in a State on the basis of their premium volume in that State.

Protection against uninsured motorists.

In order to facilitate the setting of rates under this new auto insurance reparation system, Committee Print No. 1 provides that the Secretary in consultation with state regulatory authorities, would establish a uniform classification system. This new classification system would delineate the various risk exposures relevant to setting rates for qualifying no-fault policies and related provisions. Thus, rates set by state regulatory authorities would have national uniformity as to classifications which reflected factors relevant to a first party no-fault insurance system. In addition, the Federal government, in consultation with the states, would promulgate a uniform statistical plan whereby insurance companies would report their claims and loss experience data and actual rates or premiums of each class of risk in each rating category within each coverage provided under the bill. The Federal government would then analyze this information and make it available to state insurance authorities and to the general public. This information would permit a comparison of the insurers

State regulatory role preserved.

"indicated rate" based solely upon claims and loss experience data with the actual rate or premium being charged by the insurer. The intent of this provision is to make available to state regulatory authorities information relevant to the rate making activity and to provide the insurance public with information regarding the price and quality of the product which they are required to purchase.

SUMMARY

Committee Print No. 1 of a National No-Fault Motor Insurance Act would create a mandatory auto accident reparations system which would insure all passengers and pedestrians against basic economic loss resulting from automobile accidents. The dependency of the auto insurance system on the tort liability system would be eliminated; benefits would be paid to auto accident victims without regard to fault. Licensing standards and law enforcement efforts would serve as the main force for controlling irresponsible driver behavior; illusory reliance on the insurance mechanism to create a safedriver environment would cease. If policyholders wanted to receive payment for damages (including pain and suffering) in excess of their basic economic loss resulting from injury or death, or if they wanted to protect their vehicles from physical damage, then they could at their option elect such coverages. Reasonable attorneys fees would be paid to the attorney of any policyholder who could not reach agreement with an insurance company concerning the level of economic loss benefits due him. An auto accident victim not covered by a policy of insurance could recover from an assigned claims fund unless he was responsible for the failure of coverage. Finally, the bill would provide for the rationalization of insurance classification systems and provide for the dissemination of price and quality information that would stimulate a competitive price environment in the auto insurance market.

AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

WEDNESDAY, OCTOBER 13, 1971

U.S. SENATE,
COMMITTEE ON COMMERCE,
Washington, D.C.

The committee met, pursuant to notice, at 11:10 a.m., in room 5110, New Senate Office Building, Hon. Philip A. Hart presiding.

Present: Senators Hart, Cotton, Baker, Cook, Stevens, and Beall. Senator HART. The committee will be in order.

Hearings are resuming on legislation designed to correct the present automobile insurance system to the extent there are inefficiencies and inequities in it today.

May I, for the record, read the letter which was submitted by the ranking minority member, Senator Cotton, along with Senator Baker and Senator Cook, which prompted these hearings. It is addressed to Senator Magnuson as chairman of the Commerce Committee.

UNITED STATES SENATE COMMITTEE ON COMMERCE,
September 28, 1971

HON. WARREN G. MAGNUSON,
*Chairman, Committee on Commerce,
U.S. Senate,
Washington, D.C.*

DEAR MR. CHAIRMAN: It is our understanding that the Committee will shortly take up in Executive Session Committee Print One of S. 945, the No-Fault Insurance bill, which was prepared by the Staff and has been made available to members of the Committee.

In view of the extensive changes which have been incorporated in Committee Print One, both in the fundamental concept and the cost of coverage, we feel that further hearings would be advisable. We have had correspondence from numerous individuals and companies directly involved expressing a similar concern and a desire to testify at such hearings. We will, of course, be pleased to make copies of this correspondence available to you.

We request, therefore, a continuation of hearings on this bill to fully develop the issues raised by Committee Print One of S. 945.

NORRIS COTTON,
HOWARD H. BAKER,
MARLOW W. COOK,
U.S. Senators.

The chairman of the committee, Senator Magnuson, in response has scheduled these hearings.

I am sure we will have constructive comments on this committee print as a result thereof.

Senator Cotton.

Senator COTTON. Mr. Chairman, I have a letter dated October 6, 1971 from Secretary of Transportation Volpe relative to committee print No. 1 of S. 945. I would like unanimous consent to insert the letter at this point in the record.

Staff member assigned to these hearings: S. Lynn Sutcliffe.

Senator HART. Without objection.
(The letter follows:)

THE SECRETARY OF TRANSPORTATION,
Washington, D.C., October 6, 1971.

HON. NORRIS COTTON,
U.S. Senate,
Washington, D.C.

DEAR SENATOR COTTON: You have asked for the comments of the Department of Transportation on the Committee Print of S. 945, the National No-Fault Motor Vehicle Insurance Act.

As you know, the Administration, drawing on the results of the Department of Transportation's Auto Insurance and Compensation Study, testified before your Committee last March on the general subject of reform of the auto accident reparations system. In essence, the Administration concluded that the existing system should be changed promptly to predominant reliance on first party, no-fault insurance, but that this change should take place at the State level with the States being free to experiment with various types of no-fault reforms to the ultimate benefit of all.

Our views on the need for reform and the direction that reform should take have not changed since last March. Moreover, the basic desirability of approaching reform through State action seems even clearer today than it did six months ago. At that time, only one State, Massachusetts, had begun the shift towards a first party, no-fault system; since then States have been acting at the rate of one a month, and the prospects for an acceleration of that pace in the months ahead seem far brighter than anyone would have predicted six months ago. In view of this progress and this prospect, we do not believe that enactment of S. 945, which would deprive all States the benefits of experimentation with different no-fault approaches, is either necessary, or wise, or likely to produce the optimum result in the end.

Moreover, the National Conference of Commissioners on Uniform State Laws has joined with the Department to draft legislation embracing the Administration's no-fault reform principles and designed for implementation at the State level. The Nation's Governors, when they met recently in Puerto Rico, strongly endorsed the concept of State by State action in this area and took special notes of the work of the Uniform Law Commissioners. Surely, it would be hard to argue that there is not a strong pro-no-fault reform tide running in the States today. We believe that they should be given a fair opportunity to reform their own reparations system before we resort to Federal pre-emption.

It should also be noted that the proponents of Federal action now have been unable to collect must support. Favoring the Administration's position of State by State action were all of the insurance industry, all of the agents' associations, the bar, the National Association of Insurance Commissioners and, as mentioned earlier, the Governors. At least for the foreseeable future, the Administration's position would seem to be able to commend the support of the overwhelming majority of the interested constituencies of this problem.

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

Sincerely,

JOHN A. VOLPE

Senator Cotton. May I say that the general position of Secretary Volpe, and to that extent perhaps representing the administration's viewpoint, is that since his last communication with this committee, which was last March, States have enacted various forms of so-called "no-fault" insurance at the rate of about one State per month. I believe now there are seven States plus Puerto Rico that have enacted some form of no-fault insurance.

The Nation's Governors when they met took the position that reform is needed, but they want the States to have further opportunity to enact that reform at the State level before the Congress intervenes with Federal legislation.

The concluding paragraph of Secretary Volpe's letter says:

We do believe that sound reform would be hastened, however, by Congressional passage of the Concurrent Resolution proposed by the Administration last March. This would assure the States they would be given a chance to accomplish their own reform and at the same time remove any ambiguity about our shared conviction that meaningful change must come soon. We urge your Committee to give favorable consideration to this Resolution as constituting a more desirable course of action at this time than S. 945.

May I say, Mr. Chairman, that my own feeling, independent of any expression by the Department of Transportation or by the administration is this: Only Massachusetts and perhaps Puerto Rico have had any form of "no-fault" insurance in effect long enough to gain experience from its application. I have a feeling that some reform such as is generally referred to as "no-fault" insurance is probably bound to come.

I feel, however, that when you have States adopting various approaches that the wisest course is to wait long enough so that the Congress can avail itself of the experience and of the testing of this approach to insurance in whatever various forms may be adopted by the States before turning to Federal law.

It is noteworthy that the action taken by the States thus far aims for the same objective but through different modes and moods of approach.

So, not to take up the time of witnesses and the time of the committee, I feel very strongly that legislation may be necessary in the future, and that reform of this type seems to me very desirable, but I don't believe we should act until we get enough time to observe the workings of these various State approaches and other approaches, because many other States have statutes under consideration.

I thank you, Mr. Chairman.

Senator HART. The point made by Senator Cotton just now is one that he has with conviction voiced earlier. Knowing the reach of his voice, I am sure that the committee will hear it again.

Perhaps we can resolve prudentially and wisely the course that the committee should take.

Senator BAKER. Mr. Chairman, I would like to express my appreciation to Chairman Magnuson for scheduling these 2 days of hearings on the committee print of S. 945. I am sure that the testimony we receive today and tomorrow will enable us to analyze the merits and deficiencies of this bill objectively and with careful regard for the impact this legislation would have on the automobile accident reparations system.

The modifications in S. 945 which are made by the committee print are very basic and very broad. At the hearings held last spring, several witnesses addressed themselves to the problem of gaps in the coverage provided by the bill in its original form.

I note that in the revision most, if not all, of these gaps are closed, with the effect that the tort system of reparations is virtually abrogated. But while the print addressed itself to eliminating these gaps,

it may have created other problems with cost and with premium cost distribution. These are questions which will have to be answered, and which I am sure will be answered, today and tomorrow .

Many of the witnesses whose names I see on the witness list testified last spring at the initial hearings on S. 945. At that time many of these witnesses stated basic and philosophical aversions to a no-fault program for a variety of reasons. These witnesses have been cautioned and directed to limit their testimony during these hearings to the specific issues generated by the changes embodied in Committee Print No. 1 of S. 945. It will be understood that their testimony, therefore, is an addendum to their earlier statement and, unless they so state, does not reflect any retreat from, or modification in, their basic position with regard to no-fault insurance.

I think this understanding will obviate the need for reelaboration of these basic positions and will enable us to deal more incisively with the issues which prompted Senators Cotton, Cook, and myself to request these hearings.

LETTER OF TRANSMITTAL

U.S. SENATE,
COMMITTEE ON COMMERCE,
September 15, 1971.

To Members of the Committee on Commerce, U.S. Senate:

Transmitted herewith is a staff analysis and the text of Committee Print No. 1 of the National No-fault Motor Vehicle Insurance Act, (S. 945).

This analysis will be helpful when the committee commences its consideration of this matter later this month.

WARREN G. MAGNUSON,
Chairman.

(iii)

STAFF ANALYSIS OF COMMITTEE PRINT 1 OF S. 945, THE NATIONAL NO-FAULT MOTOR VEHICLE INSURANCE ACT

Description

Committee Print 1 would create an essentially restructured automobile insurance reparations system. Tort liability arising out of automobile accidents would be eliminated, and insurance benefits to pay for losses arising out of automobile accidents would be paid without regard to fault. A person injured in an auto accident would seek reparations from his own insurance company (first-party insurance) or the insurance company of the owner of the vehicle in which he was a passenger. An injured pedestrian would seek compensation from an insurance company covering any vehicle which caused injury to him.

General effect:

Tort liability abolished.

System of first-party insurance established.

The bill would require every owner who operates a motor vehicle on the public roadways of any State to take out a basic insurance policy to cover his own losses when operating his vehicle, losses of any other driver or passenger of his vehicle, and losses of any pedestrian that is injured in an accident involving his vehicle. In addition, such basic insurance policy would cover losses incurred if a vehicle caused damage to any property other than a motor vehicle in use. For example, if a vehicle struck a legally parked car, the policy covering the vehicle would pay for damage to the parked car.

Applies to all owners.

To assure the availability of such mandatory insurance policies, the bill would require every insurance company doing business in a particular jurisdiction and writing auto insurance to accept every insurance applicant who has a valid driver's license and who pays a premium based upon an applicant's proper classification. Cancellation of the basic policy would be prohibited unless the policyholder had failed to pay the premium or had had his license revoked.

All auto insurers must provide coverage.

The phrase "qualifying no-fault policy" is used in Committee Print 1 to describe the mandatory insurance policy which every owner of a motor vehicle must have as a precondition to operating his vehicle. The qualifying no-fault policy would provide certain benefits to the policyholder, members of his family, and people injured in an automobile accident in which his vehicle was involved (who were not occupants of another vehicle.)

"Qualifying no-fault policy" defined.

Broad benefits would be paid to auto accident victims by insurers writing qualifying no-fault policies. All medical and rehabilitation costs would be paid by the insurer issuing the qualifying no-fault policy. In addition, all wage loss after income taxes would be paid until such time as the injured person could resume available and appropriate gainful activity. There is, however, a thousand dollar per month limitation on the wage replacement provisions of the qualifying no-fault policy. For those people who earn more than a thousand dollars per month, a provision in the bill would permit them to purchase greater income replacement protection. Benefits under a qualifying no-fault policy would also be paid for loss of future anticipated earnings or for impairment of earning capacity resulting from injuries sustained in an automobile accident.

Mandatory benefits to those injured.

A qualifying no-fault policy would also provide benefits to pay for any services that an injured person would have performed for his or her own benefit, or the benefit of the family, but for the injury.

For example, a housewife suffering a back injury which prevented her from doing normal housework would receive benefits to pay someone to clean her house on a regular basis until she recovered from her injury.

A qualifying no-fault policy would also pay benefits to any owner of property (other than a motor vehicle in use) which is damaged as a result of an auto accident involving the policyholder's vehicle. For example, if a vehicle struck a picket fence after swerving off the road because of a blow-out, the insurance company covering the vehicle would pay the owner of the picket fence for its repair. Likewise, if that vehicle swerved off the road and struck a parked car, the insurance company would pay for the damage to the parked car. But if vehicles in use were involved in an accident, the owners of such vehicles would have to look to their own insurance companies for recovery of benefits if they had elected to buy such coverage.

Finally, a qualifying no-fault policy would pay for any loss (tangible or intangible) exceeding those described above suffered by an occupant of the insured's motor vehicle, or pedestrian struck by such a vehicle, if such injured person did not own a motor vehicle or was not a spouse or dependent of a motor vehicle owner. In other words, this coverage would provide excess economic loss and pain and suffering protection for those people not given the opportunity to purchase the coverage described below.

In addition to the benefits provided under a mandatory qualifying no-fault policy, there are other benefits which the insurers of such policies would have to offer but which the policyholder could choose to take or not as he wished. Committee Print 1 would require insurers of qualifying no-fault policies to offer collision insurance to pay for property damage to the policyholder's automobile. The policyholder could buy such insurance and select whatever deductible level he wished.

Optional coverage.

Insurers of qualifying no-fault policies would have to offer policyholders two other types of coverage: 1) coverage to pay for tangible loss in excess of that provided by the qualifying no-fault policy, and 2) coverage to pay for intangible loss (pain and suffering, inconvenience, loss of enjoyment of life) measured by the State tort law that would have been applicable to the accident had that law not been preempted by the bill. A qualifying no-fault policyholder could elect to buy either or both coverages to protect himself, his spouse, and any dependents from such loss.

Committee Print No. 1, in effect, makes available to all the motor-ing public all the benefits that the present automobile reparations system now provides to the accident victim who *is not* found negligent or contributorily negligent and who is injured by someone who *is* found negligent *and* is fully insured up to the extent of the loss suffered by the accident victim. However, because insurance against loss in excess of that provided under the qualifying no-fault policy is not necessary for the economic well-being of an automobile accident victim or the family of such victim, the insurance buyer is given the option to buy such additional coverage if he so chooses. The controversy over whether the public wants to recover for intangible losses would be resolved by free market forces rather than legislative determination.

Benefits of existing reparations system retained.

Benefits which an insurer is required to pay under a qualifying no-fault policy would be primary—the amount paid would not be reduced by any benefits from other sources paid to cover the same loss—unless collateral benefits were provided by public health insurance or by some private insurance or plan which specifically provided that its benefits were to be primary to the qualifying no-fault policy benefits. If a person had collateral benefits which were primary, the insurer

Relationship of no-fault insurance to other insurance coverages.

of the qualifying no-fault policy would be required to give that person a standardized rate reduction reflecting the amount of his primary collateral benefits. This arrangement would accomplish two purposes: 1) it would assure compatibility of auto insurance reform legislation with health insurance reform legislation; and 2) it would allow a person to choose his source of insurance benefits and avoid duplicative payments of premiums.

Any disputes between an insurer and a policyholder which could not be resolved by negotiation could be resolved in a formal court proceeding in which the attorney fees of the policyholder are paid by the insurer and thus the insurance mechanism generally. For example, if the insurer refused to pay a wage replacement claim arguing that the policyholder was able to return to work, the policyholder could retain an attorney to pursue his claim for continued periodic benefits. The policyholder's attorney would be compensated by the insurer whether the court supported the policyholder's claim or not unless the court determined that such compensation was inappropriate or that the claim was fraudulent, frivolous, or excessive. No benefits for economic loss paid under a qualifying no-fault policy could be used to compensate an attorney. However, in disputes concerning policy provisions governing other than economic loss where reasonable attorneys' fees are not provided, an attorney would be permitted to enter into a contractual or contingent fee arrangement with a policyholder. Any contingent fee arrangement would be limited to 25% of the gross recovery of the policyholder, or a lesser amount at the discretion of the court.

Role for attorneys.

Litigation arising under the qualifying no-fault policy would be conducted in state courts of competent jurisdiction. Federal court jurisdiction would be limited to cases or controversies meeting the jurisdictional requirements of section 1332 of title 28 of the United States Code, namely diversity of parties and an amount in controversy exceeding \$10,000.

State courts jurisdiction preserved.

In the event that a person is injured or killed in an automobile accident in a vehicle or by a vehicle which is uninsured (and that person is not responsible for the fact that the vehicle is uninsured) then the victim may seek recovery from an assigned claims plan which would be required to be established in each State. The assigned claims plan would work very much like the present post-insolvency assessment plans. In the event a person with a legitimate claim had no insurance company to turn to (because the vehicle was uninsured or because the insurance company was insolvent) he could file his claim with the assigned claims plan which would be financed by assessing insurance companies doing business in a State on the basis of their premium volume in that State.

Protection against uninsured motorists.

In order to facilitate the setting of rates under this new auto insurance reparation system, Committee Print No. 1 provides that the Secretary in consultation with state regulatory authorities, would establish a uniform classification system. This new classification system would delineate the various risk exposures relevant to setting rates for qualifying no-fault policies and related provisions. Thus, rates set by state regulatory authorities would have national uniformity as to classifications which reflected factors relevant to a first party no-fault insurance system. In addition, the Federal government, in consultation with the states, would promulgate a uniform statistical plan whereby insurance companies would report their claims and loss experience data and actual rates or premiums of each class of risk in each rating category within each coverage provided under the bill. The Federal government would then analyze this information and make it available to state insurance authorities and to the general public. This information would permit a comparison of the insurers

State regulatory role preserved.

"indicated rate" based solely upon claims and loss experience data with the actual rate or premium being charged by the insurer. The intent of this provision is to make available to state regulatory authorities information relevant to the rate making activity and to provide the insurance public with information regarding the price and quality of the product which they are required to purchase.

SUMMARY

Committee Print No. 1 of a National No-Fault Motor Insurance Act would create a mandatory auto accident reparations system which would insure all passengers and pedestrians against basic economic loss resulting from automobile accidents. The dependency of the auto insurance system on the tort liability system would be eliminated; benefits would be paid to auto accident victims without regard to fault. Licensing standards and law enforcement efforts would serve as the main force for controlling irresponsible driver behavior; illusory reliance on the insurance mechanism to create a safedriver environment would cease. If policyholders wanted to receive payment for damages (including pain and suffering) in excess of their basic economic loss resulting from injury or death, or if they wanted to protect their vehicles from physical damage, then they could at their option elect such coverages. Reasonable attorneys fees would be paid to the attorney of any policyholder who could not reach agreement with an insurance company concerning the level of economic loss benefits due him. An auto accident victim not covered by a policy of insurance could recover from an assigned claims fund unless he was responsible for the failure of coverage. Finally, the bill would provide for the rationalization of insurance classification systems and provide for the dissemination of price and quality information that would stimulate a competitive price environment in the auto insurance market.

NATIONAL NO-FAULT MOTOR VEHICLE INSURANCE ACT

JULY 24, 1971

S. 945

JULY , 1971

Mr. _____ introduced the following bill ; which was read twice and referred to the Committee on _____

To require no-fault motor vehicle insurance as a condition precedent to using the public streets, roads, and highways in order to promote and regulate interstate commerce.

1 *Be it enacted by the Senate and House of Representa-*
2 *tives of the United States of America in Congress assembled,*
3 That this Act may be cited as the “National No-Fault Motor
4 Vehicle Insurance Act”.

5 DEFINITIONS

6 SEC. 2. As used in this Act—

7 (1) The term "motor vehicle" means any vehicle driven
8 or drawn by electrical or mechanical power which is manu-
9 factured primarily for use on the public street, roads, or

1 highways, except any vehicle operated exclusively on a rail
2 or rails.

3 (2) The term "insured motor vehicle" means a motor
4 vehicle (A) which is insured under a qualifying no-fault
5 policy, or (B) the owner of which is a self-insurer with re-
6 spect to such vehicle.

7 (3) The term "uninsured motor vehicle" means a motor
8 vehicle which is not an insured motor vehicle.

9 (4) The term "qualifying no-fault policy" means an
10 insurance policy which meets the requirements of section 5
11 (a) and (b) (but such term does not refer to any provision
12 of such a policy which relates solely to a coverage described
13 in section 5 (c) or an additional coverage or benefit referred
14 to in section 5 (d)).

15 (5) The term "owner" means a person who holds the
16 legal title to a motor vehicle; except that in the case of a
17 motor vehicle which is the subject of a security agreement
18 or lease with option to purchase with the debtor or lessee hav-
19 ing the right to possession, such term means the debtor or
20 lessee.

21 (6) The term "insurer" means any person or govern-
22 mental entity engaged in the business of issuing or delivering
23 motor vehicle insurance policies.

24 (7) The term "self-insurer" with respect to any motor

1 vehicle means a person who has satisfied the requirements
2 of section 4 (a) in the manner provided by section 4 (a) (2).

3 (8) The term "operation, maintenance, or use" when
4 used with respect to a motor vehicle includes loading or un-
5 loading the vehicle, but does not include conduct within the
6 course of a business of repairing, servicing, or otherwise main-
7 taining vehicles unless the conduct occurs outside the premises
8 of such business.

9 (9) The term "motor vehicle accident" means an acci-
10 dent arising out of the operation, maintenance, or use of a
11 motor vehicle.

12 (10) The term "accidental harm" means bodily injury,
13 death, sickness, or disease caused by a motor vehicle accident
14 while in or upon or entering into or alighting from, or
15 through being struck by a motor vehicle or object drawn or
16 propelled by a motor vehicle.

17 (11) The term "death" (except as used in this para-
18 graph and paragraphs (10) and (12)) means accidental
19 harm resulting at any time in death.

20 (12) The term "injury" means accidental harm not
21 resulting in death.

22 (13) The term "economic loss" with respect to any in-
23 jury or death means—

24 (A) all appropriate and reasonable expenses neces-

1 sarily incurred for medical, hospital, surgical, professional
 2 nursing, dental, ambulance, prosthetic services, and any
 3 Federally recognized religious remedial care and treat-
 4 ment;

5 (B) all appropriate and reasonable expenses neces-
 6 sarily incurred for psychiatric, physical, and occupa-
 7 tional therapy and rehabilitation;

8 (C) an amount equal to the lesser of—

9 (i) \$1,000 per month, or

10 (ii) the monthly earnings for the period dur-
 11 ing which the injury or death results in the inabil-
 12 ity to engage in available and appropriate gainful
 13 activity, or

14 (D) a monthly amount equal to the amount (if
 15 any) by which (i) a person's monthly earnings (as
 16 defined in paragraph (14)) or \$1,000, whichever is
 17 less, exceeds (ii) any lesser monthly earnings of such
 18 person at such time as he resumes gainful activity.

19 (E) all appropriate and reasonable expenses neces-
 20 sarily incurred as a result of such injury or death, in-
 21 cluding, but not limited to, (i) expenses incurred in ob-
 22 taining services in substitution of those that the injured
 23 or deceased person would have performed for the benefit
 24 of himself or his family, (ii) funeral expenses, and (iii)

1 vehicle means a person who has satisfied the requirements
2 of section 4 (a) in the manner provided by section 4 (a) (2).

3 (8) The term "operation, maintenance, or use" when
4 used with respect to a motor vehicle includes loading or un-
5 loading the vehicle, but does not include conduct within the
6 course of a business of repairing, servicing, or otherwise main-
7 taining vehicles unless the conduct occurs outside the premises
8 of such business.

9 (9) The term "motor vehicle accident" means an acci-
10 dent arising out of the operation, maintenance, or use of a
11 motor vehicle.

12 (10) The term "accidental harm" means bodily injury,
13 death, sickness, or disease caused by a motor vehicle accident
14 while in or upon or entering into or alighting from, or
15 through being struck by a motor vehicle or object drawn or
16 propelled by a motor vehicle.

17 (11) The term "death" (except as used in this para-
18 graph and paragraphs (10) and (12)) means accidental
19 harm resulting at any time in death.

20 (12) The term "injury" means accidental harm not
21 resulting in death.

22 (13) The term "economic loss" with respect to any in-
23 jury or death means—

24 (A) all appropriate and reasonable expenses neces-

1 sarily incurred for medical, hospital, surgical, professional
 2 nursing, dental, ambulance, prosthetic services, and any
 3 Federally recognized religious remedial care and treat-
 4 ment;

5 (B) all appropriate and reasonable expenses neces-
 6 sarily incurred for psychiatric, physical, and occupa-
 7 tional therapy and rehabilitation;

8 (C) an amount equal to the lesser of—

9 (i) \$1,000 per month, or

10 (ii) the monthly earnings for the period dur-
 11 ing which the injury or death results in the inabil-
 12 ity to engage in available and appropriate gainful
 13 activity, or

14 (D) a monthly amount equal to the amount (if
 15 any) by which (i) a person's monthly earnings (as
 16 defined in paragraph (14)) or \$1,000, whichever is
 17 less, exceeds (ii) any lesser monthly earnings of such
 18 person at such time as he resumes gainful activity.

19 (E) all appropriate and reasonable expenses neces-
 20 sarily incurred as a result of such injury or death, in-
 21 cluding, but not limited to, (i) expenses incurred in ob-
 22 taining services in substitution of those that the injured
 23 or deceased person would have performed for the benefit
 24 of himself or his family, (ii) funeral expenses, and (iii)

1 attorneys' fees and costs to the extent provided in sec-
2 tion 8.

3 (14) The term "monthly earnings" means—

4 (A) in the case of a regularly employed person,
5 one-twelfth of the average annual compensation after in-
6 come taxes at the time of injury or death;

7 (B) in the case of a person regularly self-employed,
8 one-twelfth of the average annual earnings after in-
9 come taxes at the time of injury or death;

10 (C) in the case of an unemployed person or a
11 person not regularly employed or self-employed, one-
12 twelfth of the anticipated annual compensation after
13 income taxes of such person paid from the time such
14 person would reasonably have been expected to be reg-
15 ularly employed:

16 *Provided, however,* That such sums are to be periodically in-
17 creased in a manner corresponding to annual compensation
18 increases that would predictably result but for the injury
19 or death. The Secretary is authorized to promulgate rules
20 consistent with this paragraph defining further the term
21 "monthly earnings".

22 (15) The term "net economic loss" means, in the case
23 of injury or death, economic loss reduced (but not below
24 zero) by the amount of any benefit or payment received

1 (or legally entitled to be received and actually available to
 2 the claimant) for losses resulting from such injury or death
 3 from any of the following sources—

4 (A) any public health insurance or plan;

5 (B) any private insurance or plan containing ex-
 6 plicit provisions making its benefits primary to any bene-
 7 fits under a qualifying no-fault policy.

8 (16) The term “loss resulting from damage to the in-
 9 sured’s motor vehicle” means—

10 (A) an amount equal to the direct damage or loss
 11 to an insured motor vehicle as a result of collision or
 12 upset, fire, theft, flood, or other hazard incident to the
 13 operation, maintenance, or use of an insured motor
 14 vehicle; and

15 (B) all appropriate and reasonable expenses neces-
 16 sarily incurred as a result of such damage to or loss of
 17 an insured motor vehicle, including expenses incurred in
 18 renting a vehicle in substitution for the insured motor
 19 vehicle for an agreed upon period.

20 (17) The term “damage other than economic loss”
 21 means in the case of injury or death—

22 (A) tangible damage in excess of economic loss (as
 23 defined in section 3 (13)) ; and

24 (B) intangible damage, characterized also as pain
 25 and suffering or general damage,

1 measured by applicable State tort law which would have
2 been applicable but for section 3.

3 (18) The term "motor vehicle in use" means a motor
4 vehicle being operated on any public street or roadway or
5 in any other public place; it does not mean a motor vehicle
6 legally parked to the side of any public street or roadway
7 or in any public place.

8 (19) The term "without regard to fault" means irre-
9 spective of fault as a cause of injury or death, and without
10 application of the principle of liability based on negligence.

11 (20) The term "criminal conduct" means the commis-
12 sion of an offense punishable by imprisonment for one year
13 or more, or operation or use of a motor vehicle with the
14 specific intent of causing injury or damage, or operation or
15 use of a motor vehicle as a converter without a good faith
16 belief that the operator or user is legally entitled to operate
17 or use such vehicle.

18 (21) The term "Secretary" means the Secretary of
19 _____.

20 (22) The term "State" means any State, the District
21 of Columbia, the Commonwealth of Puerto Rico, the Virgin
22 Islands, Guam, American Samoa, or the Canal Zone.

23 TORT EXEMPTION

24 SEC. 3. No person who is—

1 (a) the owner, operator, or user of an insured motor
2 vehicle, or

3 (b) the operator or user of an uninsured motor ve-
4 hicle who operates or uses such vehicle without any rea-
5 son to believe that such vehicle is an uninsured motor
6 vehicle,

7 shall be liable for tort damages of any nature arising out of
8 the ownership, maintenance, operation, or use of such vehi-
9 cle unless that person is engaging in criminal conduct (as
10 defined in section 2 (20)) which causes such damage in
11 which case he shall be liable to the extent provided by State
12 law for all damages other than economic loss.

13 CONDITIONS OF OPERATION AND REGISTRATION

14 SEC. 4. (a) (1) No person may register any motor vehi-
15 cle in a State or operate or use a motor vehicle upon any
16 public street, road, or highway of any State at any time un-
17 less such motor vehicle is insured under a qualifying no-fault
18 policy (as defined in section 2 (4)), pursuant to such regu-
19 lations (including those determining the manner and term of
20 proof of such insurance) as the Secretary shall prescribe.

21 (2) The requirements of this subsection may be satisfied
22 by any owner of a motor vehicle if—

23 (A) such owner provides a surety bond, proof of
24 qualifications as a self-insurer, or other securities afford-
25 ing security substantially equivalent to that afforded

1 under a qualifying no-fault policy, as determined and
2 approved by the Secretary under regulations, and

3 (B) the Secretary is satisfied that in case of injury
4 or death or property damage, any claimant would have
5 the same rights against such owner under applicable
6 State law as the claimant would have had under such law
7 had a qualifying no-fault policy been applicable to such
8 vehicle.

9 (b) No State may require the purchase or acquisition of
10 insurance or other security as a condition to the ownership,
11 registration, operation, or use of any motor vehicle upon the
12 public streets, road, or highways of such State that is incon-
13 sistent with a qualifying no-fault policy.

14 (c) Any person who knowingly violates the provisions
15 of subsection (a) of this section shall be punished by a fine
16 not to exceed \$1,000 or imprisonment for a period of not
17 to exceed six months, or both. Attorneys General of the
18 several States are given concurrent authority to bring actions
19 in their respective State courts of competent jurisdiction
20 seeking a fine not to exceed \$1,000 or imprisonment for a
21 period not to exceed six months for any knowing violations
22 of the provisions of subsection (a) of this section.

23 **INSURANCE REQUIREMENTS**

24 **SEC. 5.** (a) In order to be a qualifying no-fault policy,
25 an insurance policy covering a motor vehicle shall provide

1 benefits for injury or death (as defined in section 2 para-
2 graphs (11) and (12)) as follows:

3 (1) Except as otherwise provided in paragraph (2)—

4 (A) in the case of injury to any person (including
5 the owner, operator, or user of the insured motor vehi-
6 cle), the insurer shall pay, without regard to fault, to
7 such person an amount equal to the net economic loss
8 (as defined in section 2 (15)) sustained by such per-
9 son as a result of such injury; or

10 (B) in the case of death of any person (including
11 the owner, operator, or user of the insured motor ve-
12 hicle), the insurer shall pay, without regard to fault, to
13 the legal representative of such person, for the benefit
14 of the surviving spouse and any dependent (as defined
15 in section 152 of the Internal Revenue Code of 1954)
16 of such person, an amount equal to the net economic
17 loss sustained by such spouse and dependent as a result
18 of the death of such person.

19 (2) No payment may be made for net economic loss
20 sustained by—

21 (A) the occupants of a motor vehicle other than the
22 insured motor vehicle; or

23 (B) the operator or user of a motor vehicle engag-
24 ing in criminal conduct (as defined in section 2 (20))
25 which causes any such loss.

1 (3) Payments for net economic loss shall be made as
2 such loss is incurred except that in the case of death, pay-
3 ment for such loss may, at the option of the beneficiary, be
4 made immediately in a lump sum payment appropriately
5 discounted in accordance with regulations of the Secretary.
6 Amounts of net economic loss unpaid thirty days after the
7 insurer has received reasonable proof of the fact and amount
8 of loss realized, and demand for payment thereof shall (after
9 the expiration of such thirty days) bear interest at the rate
10 of 2 per centum per month.

11 (4) A claim for net economic loss based upon injury to
12 or death of a person who is not an occupant of any motor
13 vehicle involved in an accident may be made against the
14 insurer of any involved vehicle. The insurer against whom
15 the claim is asserted shall process and pay the claim as if
16 wholly responsible, but such insurer shall thereafter be en-
17 titled to recover from the insurers of all other involved ve-
18 hicles proportionate contribution for the benefits paid and
19 the costs of processing the claim.

20 (5) No part of loss benefits paid under a qualifying no-
21 fault policy (except those paid by provisions required in
22 section 5(b) (1) shall be applied in any manner as attor-
23 ney's fees in the case of injury or death for which such bene-
24 fits are paid. Any contract in violation of this provision shall
25 be illegal and unenforceable, and it shall constitute an unlaw-

1 ful and unethical act for any attorney to solicit, enter into, or
2 knowingly accept benefits under any such contract.

3 (b) In order to be a qualifying no-fault policy, an in-
4 surance policy covering a motor vehicle shall provide the
5 following benefits in addition to those enumerated in sub-
6 section (a) of this section:

7 (1) in the case of injury or death to any person
8 not an owner of a motor vehicle or a spouse or depend-
9 ent of an owner, the insurer shall pay, without regard to
10 fault, to such person compensation for damage other
11 than economic loss sustained by such person as a result
12 of such injury;

13 (2) in the case of damage to any property other
14 than a motor vehicle in use arising out of a motor vehicle
15 accident, insurers of any motor vehicles involved in the
16 motor vehicle accident shall pay on a proportionate basis
17 to the owner of such property an amount equal to the
18 loss occasioned by the damage.

19 (c) In addition to the coverages described in subsec-
20 tions (a) and (b), the insurer issuing a qualifying no-fault
21 policy shall make available to the insured the following
22 optional insurance under the following conditions:

23 (1) At the option of the insured, the insurer shall offer
24 provisions covering loss resulting from damage to the in-

1 sured's motor vehicle with such deductibles as the insured
2 elects.

3 (2) At the option of the insured, the insurer shall offer
4 to compensate for damage other than economic loss either
5 or both of the following provisions whereby the insurer in
6 the case of injury or death to the insured, his spouse, or any
7 dependents agrees to pay (without regard to fault) to such
8 person compensation for:

9 (A) tangible damage in excess of economic loss
10 (as defined in section 2 (13)) ;

11 (B) intangible damage sustained by such person as
12 a result of such injury or death.

13 (3) (A) A person may not submit a claim to his insurer
14 for the recovery of damage other than economic loss sus-
15 tained as a result of an injury until the last periodic payment
16 for net economic loss has been made or until a period of three
17 years from the time of the injury has elapsed, whichever
18 occurs first.

19 (B) Contingent fee arrangements for the prosecution
20 of claims under a policy for compensation for damages other
21 than economic loss shall be made in accordance with section
22 8 (b) of this Act.

23 (4) Notwithstanding any provision of State law to the
24 contrary, the statute of limitation for bringing suit under pro-

1 visions providing compensation for damages other than eco-
2 nomic loss shall be:

3 (A) four years from the date of the motor vehicle
4 accident upon which the claim is based, or

5 (B) one year after the last payment for economic
6 loss recoverable under paragraph (1) of this subsection
7 is paid

8 whichever be the lesser length of time.

9 (d) (1) Any policy of insurance described in this section
10 may contain—

11 (A) additional coverages and benefits with respect
12 to any injury, death, or any other loss from motor
13 vehicle accidents or loss from operation of a motor
14 vehicle; and

15 (B) terms, conditions, exclusions, and deductible
16 clauses; consistent with the required provisions of such
17 policy and approved by the Secretary, who shall only
18 approve terms, conditions, exclusions, deductible clauses,
19 coverages, and benefits which are fair and equitable, and
20 which limit the variety of coverage available so as to
21 give buyers of insurance reasonable opportunity to com-
22 pare the cost of insuring with various insurers.

23 (2) Any policy of insurance described in this section
24 shall contain a provision, in accordance with regulations of

1 sured's motor vehicle with such deductibles as the insured
2 elects.

3 (2) At the option of the insured, the insurer shall offer
4 to compensate for damage other than economic loss either
5 or both of the following provisions whereby the insurer in
6 the case of injury or death to the insured, his spouse, or any
7 dependents agrees to pay (without regard to fault) to such
8 person compensation for:

9 (A) tangible damage in excess of economic loss
10 (as defined in section 2 (13)) ;

11 (B) intangible damage sustained by such person as
12 a result of such injury or death.

13 (3) (A) A person may not submit a claim to his insurer
14 for the recovery of damage other than economic loss sus-
15 tained as a result of an injury until the last periodic payment
16 for net economic loss has been made or until a period of three
17 years from the time of the injury has elapsed, whichever
18 occurs first.

19 (B) Contingent fee arrangements for the prosecution
20 of claims under a policy for compensation for damages other
21 than economic loss shall be made in accordance with section
22 8 (b) of this Act.

23 (4) Notwithstanding any provision of State law to the
24 contrary, the statute of limitation for bringing suit under pro-

visions providing compensation for damages other than economic loss shall be:

(A) four years from the date of the motor vehicle accident upon which the claim is based, or

(B) one year after the last payment for economic loss recoverable under paragraph (1) of this subsection is paid

whichever be the lesser length of time.

(d) (1) Any policy of insurance described in this section may contain—

(A) additional coverages and benefits with respect to any injury, death, or any other loss from motor vehicle accidents or loss from operation of a motor vehicle; and

(B) terms, conditions, exclusions, and deductible clauses; consistent with the required provisions of such policy and approved by the Secretary, who shall only approve terms, conditions, exclusions, deductible clauses, coverages, and benefits which are fair and equitable, and which limit the variety of coverage available so as to give buyers of insurance reasonable opportunity to compare the cost of insuring with various insurers.

(2) Any policy of insurance described in this section shall contain a provision, in accordance with regulations of

1 the Secretary, specifying the periods within which claims
2 may be filed and actions against the insurer may be brought.

3 (e) Any policy of insurance described in this section
4 must offer different standardized categories of premium re-
5 ductions reflecting benefits available to the policyholder and
6 members of his family as a result of public or private insur-
7 ance or plans or other benefit sources described in section
8 2 (15) of this Act, as being primary to benefits under a
9 qualified no-fault policy.

10 (f) (1) No insurer may issue or offer to issue any policy
11 which he represents is a qualifying no-fault policy unless
12 such policy meets the requirements of subsections (a) and
13 (b) (and of subsection (c) if the insured elects the optional
14 coverage under such subsection), is consistent with the re-
15 quirements of subsection (d), and includes all applicable
16 standard uniform policy provisions under section 5 (c) and
17 6 (d).

18 (2) (A) Any insurer who violates paragraph (1) shall
19 be assessed a civil penalty of not to exceed \$5,000 for each
20 policy which the insurer issues or offers to issue in violation
21 of such paragraph.

22 (B) Any insurer who willfully violates paragraph (1)
23 shall be fined not more than \$5,000, or imprisoned not more
24 than one year, or both.

1 (g) (1) Subject to paragraph (2)—

2 (A) An application for a qualifying no-fault policy
3 covering a motor vehicle in a State may not be rejected
4 by an insurer authorized to issue such a policy in such
5 State unless—

6 (i) the principal operator of such vehicle does
7 not have a license which permits him to operate
8 such vehicle, or

9 (ii) the application is not accompanied by a
10 reasonable portion of the premium (as determined
11 under regulations of the Secretary).

12 (B) A qualifying no-fault policy once issued may
13 not be canceled or refused renewal by an insurer except
14 for—

15 (i) suspension or revocation of the license of
16 the principal operator to operate a motor vehicle, or

17 (ii) failure to pay the premium for such policy
18 after reasonable demand therefor.

19 In any case of cancellation or refusal to renew under clause
20 (ii), written notice shall be given to the insured.

21 (2) An insurer may reject or refuse to accept additional
22 applications for, or refuse to renew qualifying no-fault poli-
23 cies (A) if the domiciliary State insurance supervisory au-
24 thority of such insurer deems in writing that the financial
25 soundness of such insurer would be impaired by the writing

1 of additional policies of such insurance, or (B) such insurer
2 ceases to write any new policies of insurance of any kind in
3 the jurisdiction of the rejected applicant.

4 (3) Whoever knowingly violates, or conspires to vio-
5 late, the provisions of paragraph (1) or (2) of this sub-
6 section shall be assessed a civil penalty of not to exceed
7 \$1,000 for each separate violation. Each violation of para-
8 graph (A) of this subsection with respect to any policy-
9 holder or applicant for insurance shall constitute a separate
10 violation.

11 UNIFORM STATISTICAL PLAN AND PRICE INFORMATION

12 SEC. 6. (a) The Secretary shall, after consultation with
13 insurers and State insurance supervisory authorities,
14 promulgate a common, uniform statistical plan for the allo-
15 cation and compilation of claims and loss experience data
16 for each coverage under section 5 of this Act, and upon
17 promulgation, such plan shall be followed by every insurer
18 writing qualifying no-fault policies, and by every rating or
19 advisory organization or statistical agent used by any such
20 insurer to gather, compile, or report claims and loss experi-
21 ence data.

22 (b) Such statistical plan shall contain data pertaining
23 to the claims and loss experience for the classes of risk in
24 each rating territory within each coverage under section 5 of
25 this Act. Such statistical plan shall not contain data pertain-

1 ing to expenses for adjusting losses, underwriting expenses,
2 general administration expenses, or any other expense ex-
3 perience for any class of risk in each rating territory within
4 the coverages under section 5 of this Act. In carrying out
5 the provisions of this section, no insurer, rating, or advisory
6 organization, or statistical agent, or any other association
7 of insurers, may pool, or in any manner combine, any such
8 expenses or expense experience, or otherwise act in concert
9 with respect thereto.

10 (c) Every insurer writing policies of insurance which
11 meet the requirements of section 5 of this Act, and every
12 rating or advisory organization or statistical agent used by
13 such insurer to gather or compile claims and loss experience
14 data, shall report such data in accordance with the provisions
15 of the statistical plan required by this section at such times
16 and in such manner as the Secretary shall by regulations
17 prescribe.

18 (d) The Secretary shall prescribe regulations which
19 shall require a minimal number of standard uniform—

20 (1) policy provisions for each coverage under sec-
21 tion 5 of this Act; and

22 (2) classes of risk and rating territories for each
23 coverage under section 5 of this Act;

24 in order to accomplish the purposes of the statistical plan
25 required by this section.

1 (e) Every insurer writing qualifying no-fault policies
2 shall provide the Secretary with the actual rate or premium
3 being charged for each class of risk in each rating territory
4 within each coverage under section 5 of this Act at such
5 times and in such manner as the Secretary shall by rules and
6 regulations prescribe.

7 (f) The Secretary may, after consultation with the in-
8 surers and State insurance supervisory authorities, appoint a
9 statistical agent or agents, to receive, gather, compile, re-
10 port, and analyze the claims and loss experience data, and
11 actual rates or premiums, specified in subsections (c) and
12 (e) of this section.

13 (g) From time to time, but not less often than semi-
14 annually, the Secretary shall analyze and freely and fully
15 make available to the State insurance supervisory authorities
16 and to the general public, with respect to every insurer
17 writing qualifying no-fault policies, a comparison of such
18 insurer's indicated rate based solely upon the claims and
19 loss experience data for each class of risk in each rating
20 territory within each coverage under section 5 with the
21 actual rate or premiums being charged by the insurer for
22 such class of risk in each rating territory within such cover-
23 age. The claims and loss experience data, and actual rates or
24 premiums specified in subsections (c) and (e) of this sec-
25 tion shall be made available to the general public at such

1 times and in such manner as the Secretary shall by regu-
2 lation prescribe.

3 (h) Any insurer writing qualifying no-fault policies, or
4 any rating or advisory organization or statistical agent used
5 by any such insurer to gather, compile, or report claims and
6 loss experience data with respect to policies meeting the
7 requirements of section 5, who fails to:

8 (1) follow the statistical plan promulgated in ac-
9 cordance with subsections (a) and (b) of this section,
10 or

11 (2) observe the prohibition in subsection (b) of
12 this section against pooling, or in any manner combining
13 expense experience, or

14 (3) report to the Secretary, or his statistical agent
15 or agents, the claims and loss experience data as re-
16 quired in subsections (c) and (f) of this section, or

17 (4) follow the standard uniform classes of risk and
18 rating territories prescribed by the Secretary as required
19 in subsection (d) of this section, or

20 (5) provide the Secretary, or his statistical agent
21 or agents, with the actual rate or premium being charged
22 for each class of risk in each rating territory within such
23 coverage as required in subsections (e) and (f) of this
24 section,

25 shall be assessed a civil penalty of not to exceed \$5,000
26 for each violation.

ASSIGNED CLAIMS PLAN

1
2 SEC. 7. (a) (1) The Secretary shall, after consultation
3 with insurers and State insurance supervisory authorities,
4 organize an assigned claims bureau and assigned claims plan
5 in each State. Upon organization, each such bureau and
6 plan shall be maintained, subject to regulation by the applica-
7 ble State insurance supervisory authority, by the insurers
8 writing qualifying no-fault policies in such State if (and for
9 so long as) the Secretary is satisfied that all such insurers are
10 required under State law to participate and that no such
11 insurer may withdraw without the consent of the State.

12 (2) In any case in which an assigned claims bureau
13 and assigned claims plan in any State is not maintained in
14 a manner considered by the Secretary to be consistent with
15 the provisions of this Act, the Secretary shall maintain
16 such bureau and plan.

17 (3) The Secretary shall prescribe regulations which
18 shall set forth the extent to which, for purposes of this
19 section—

20 (~~A~~) a self-insurer shall be treated as an insurer, and

21 (B) benefits which a self-insurer is obligated to pay
22 shall be treated as insurance benefits under a qualifying
23 no-fault policy.

24 (b) The costs incurred in the operation of each assigned
25 claims bureau and assigned claims plan shall be assessed
26 against insurers in each State by the applicable State insur-

1 ance supervisory authority (or by the Secretary during any
 2 period during which such bureau and plan are maintained by
 3 him under subsection (a) (2)) according to regulations of
 4 such State authority (or of the Secretary if the bureau and
 5 plan are maintained by him) that assure fair allocations
 6 among such insurers writing qualifying policies in the State,
 7 on a basis reasonably related to the volume of insurance writ-
 8 ten under qualifying no-fault policies.

9 (c) (1) No insurer may write any qualifying no-fault
 10 policy unless the insurer participates in the assigned claims
 11 bureau and assigned claims plan in each State in which such
 12 insurer writes such policies.

13 (2) An insurer who violates paragraph (1) of this sub-
 14 section shall be assessed a civil penalty of \$5,000 for each
 15 policy he issues in violation of such paragraph.

16 (d) Except as provided in subsection (e) of this sec-
 17 tion, each person sustaining injury or death (or his legal
 18 representative) may obtain the insurance benefits described in
 19 sections 5 (a) and (b) of this Act through the assigned
 20 claims bureau and assigned claims plan in the State in which
 21 such person resides if—

22 (1) no insurance benefits under qualifying no-fault
 23 policies are applicable to the injury or death; or

24 (2) no such insurance benefits applicable to the
 25 injury or death can be identified; or

ASSIGNED CLAIMS PLAN

1
2 SEC. 7. (a) (1) The Secretary shall, after consultation
3 with insurers and State insurance supervisory authorities,
4 organize an assigned claims bureau and assigned claims plan
5 in each State. Upon organization, each such bureau and
6 plan shall be maintained, subject to regulation by the applica-
7 ble State insurance supervisory authority, by the insurers
8 writing qualifying no-fault policies in such State if (and for
9 so long as) the Secretary is satisfied that all such insurers are
10 required under State law to participate and that no such
11 insurer may withdraw without the consent of the State.

12 (2) In any case in which an assigned claims bureau
13 and assigned claims plan in any State is not maintained in
14 a manner considered by the Secretary to be consistent with
15 the provisions of this Act, the Secretary shall maintain
16 such bureau and plan.

17 (3) The Secretary shall prescribe regulations which
18 shall set forth the extent to which, for purposes of this
19 section—

20 (A) a self-insurer shall be treated as an insurer, and

21 (B) benefits which a self-insurer is obligated to pay
22 shall be treated as insurance benefits under a qualifying
23 no-fault policy.

24 (b) The costs incurred in the operation of each assigned
25 claims bureau and assigned claims plan shall be assessed
26 against insurers in each State by the applicable State insur-

1 ance supervisory authority (or by the Secretary during any
2 period during which such bureau and plan are maintained by
3 him under subsection (a) (2)) according to regulations of
4 such State authority (or of the Secretary if the bureau and
5 plan are maintained by him) that assure fair allocations
6 among such insurers writing qualifying policies in the State,
7 on a basis reasonably related to the volume of insurance writ-
8 ten under qualifying no-fault policies.

9 (c) (1) No insurer may write any qualifying no-fault
10 policy unless the insurer participates in the assigned claims
11 bureau and assigned claims plan in each State in which such
12 insurer writes such policies.

13 (2) An insurer who violates paragraph (1) of this sub-
14 section shall be assessed a civil penalty of \$5,000 for each
15 policy he issues in violation of such paragraph.

16 (d) Except as provided in subsection (e) of this sec-
17 tion, each person sustaining injury or death (or his legal
18 representative) may obtain the insurance benefits described in
19 sections 5 (a) and (b) of this Act through the assigned
20 claims bureau and assigned claims plan in the State in which
21 such person resides if—

22 (1) no insurance benefits under qualifying no-fault
23 policies are applicable to the injury or death; or

24 (2) no such insurance benefits applicable to the
25 injury or death can be identified; or

1 (3) the only identifiable insurance benefits under
 2 qualifying no-fault policies applicable to the injury or
 3 death will not be paid in full because of financial inability
 4 of one or more insurers to fulfill their obligations.

5 (e) A person shall be disqualified from receiving bene-
 6 fits through any assigned claims bureau and assigned claims
 7 plan established pursuant to this section if—

8 (1) such person is disqualified under section 5 (a)

9 (2) (B) of this Act from receiving the insurance bene-
 10 fits under section 5 (a) of this Act,

11 (2) such person was—

12 (A) the owner or registrant of an uninsured
 13 motor vehicle at the time of its involvement in the
 14 accident out of which such person's injury arose, or

15 (B) the operator of such a vehicle at such time
 16 with reason to believe that such vehicle was an un-
 17 insured motor vehicle.

18 (f) A claim or claims arising from injury or death to
 19 one person sustained in one accident and brought through
 20 the applicable assigned claims plan shall be assigned to one
 21 insurer, or to the applicable assigned claims bureau, which
 22 after such assignment shall have the same rights and obliga-
 23 tions as it would have had had it issued a qualifying no-fault
 24 policy (or such form as the Secretary by regulation pre-
 25 scribes) applicable to such injury or death.

1 (g) The assignment of claims shall be made according
2 to regulations of the State supervisory authority (or the
3 Secretary if the bureau and plan are maintained by him
4 under subsection (a) (2)) that assure fair allocation of the
5 burden of assigned claims among insurers doing business in
6 the particular State on a basis reasonably related to the
7 volume of insurance written under sections 5 (a) and (b) of
8 this Act.

9 (h) A person or his legal representative claiming
10 through an assigned claims plan shall notify the applicable
11 bureau of his claim within the period prescribed under sec-
12 tion 5 (d) (2) for filing a claim for insurance benefits un-
13 der section 5 (a) or (b) . The bureau shall promptly assign
14 the claim and notify the claimant of the identity and address
15 of the insurer to which the claim is assigned, or of the
16 bureau if the claim is assigned to it. No action by the claim-
17 ant against the insurer to which his claim is assigned, or
18 against the bureau if the claim is assigned to it, shall be
19 commenced later than sixty days after receipt of notice of
20 the assignment or after the expiration of the period pre-
21 scribed in section 5 (d) (2) for commencing an action against
22 an insurer, whichever is later.

23 (i) All reasonable and necessary costs incurred in the
24 handling and disposition of assigned claims, including amount
25 paid pursuant to assessments under subsection (b) of this

1 section, may be considered in making or regulating rates
2 for the insurance under sections 5 (a) and (b) of this Act,
3 but if such costs are considered in the rates or premiums for
4 such insurance, the pure loss portion of such costs shall be
5 reported separately under the uniform statistical plan pro-
6 vided for by section 6 of this Act, and that portion of the
7 actual rate or premium being charged for such insurance
8 attributable to the entire amount of such costs incurred in the
9 handling and disposition of assigned claims shall be reported
10 separately under subsection (e) of section 6 of this Act.

11 (j) An insurer who makes an assigned claims payment
12 shall be subrogated to any rights the person to whom the
13 payment was made may have had against the owner or op-
14 erator of any uninsured motor vehicle involved in the acci-
15 dent out of which the claim arose.

16 CLAIMANT'S ATTORNEY'S FEES

17 SEC. 8. (a) A person making a claim under a qualify-
18 ing no-fault policy may be allowed an award of a reasonable
19 sum for attorney's fee (based upon actual time expended)
20 and all reasonable costs of suit in any case in which the
21 insurer denies all or part of a claim for benefits under such
22 policy unless the court determines that the claim was fraudu-
23 lent, excessive, or frivolous.

24 (b) A person making claim under policy provisions
25 meeting the requirements of section 5 (b) (1) or 5(c)

1 may enter into a contingent fee arrangement with an attor-
 2 ney but in no event may the fee exceed 25 per centum of
 3 any award the claimant receives, and may be further limited
 4 at the discretion of the court.

5 FRAUDULENT CLAIMS

6 SEC. 9. Within the discretion of the court, an insurer or
 7 self-insurer may be allowed an award of a reasonable sum as
 8 attorney's fee (based upon actual time expended) and all
 9 reasonable costs of suit for its defense against a person mak-
 10 ing claim against such insurer or self-insurer where such
 11 claim was fraudulent, and such attorney's fee and all such
 12 reasonable costs of suit so awarded may be treated as an off-
 13 set against any benefits due or to become due to such
 14 person.

15 ADMINISTRATION

16 SEC. 10. In order to carry out the provisions and fulfill
 17 the purpose of this Act the Secretary shall—

18 (1) consult with representatives of State agencies
 19 charged with the regulation of the business of insurance,
 20 representatives of the private insurance business, and
 21 such other persons, organizations, and agencies of the
 22 Federal, State, or local governments as he deems neces-
 23 sary; and

24 (2) make, promulgate, amend, and repeal such reg-
 25 ulations as he deems necessary.

1

JURISDICTION

2

SEC. 11. (a) No district court of the United States may
3 entertain an action for breach of any contractual or other
4 obligation assumed by an insurer or self-insurer under a
5 policy of insurance containing mandatory or optional provi-
6 sions in accordance with section 5 of this Act unless a person
7 bringing such action meets the jurisdictional requirements
8 of section 1332 of title 28 of the United States Code.

9

(b) Any person may bring suit for breach of any con-
10 tractual obligation assumed by an insurer under a policy of
11 insurance containing such mandatory or optional provisions
12 in any State court of competent jurisdiction.

13

EFFECTIVE DATE

14

SEC. 12. (a) Except as provided in subsection (b),
15 this Act shall take effect one year after its enactment.

16

(b) Sections 4, 5 (f) , and 7 (d) shall take effect on the
17 first day of the eighteenth calendar month which begins after
18 the date of enactment of this Act. Section 3 shall apply with
19 respect to accidents occurring on or after the first day of such
20 eighteenth calendar month.

Senator HART. All of us welcome as our first witness our distinguished Senator from Illinois, Mr. Stevenson.

As Mr. Stevenson comes forward, I think it fair—and I hope it doesn't sound too partisan—to suggest that it is unusual as a new member of the Senate that he has managed to master such a sensitive and as important an issue as no-fault automobile insurance for the District of Columbia.

The District of Columbia Committee is at a point where the Senate may soon be asked itself to act affirmatively in that regard.

We welcome the Senator from Illinois this morning.

STATEMENT OF HON. ADLAI E. STEVENSON III, U.S. SENATOR FROM ILLINOIS

Senator STEVENSON. I thank you, Mr. Chairman, and all the members of this distinguished committee for the opportunity to appear here this morning.

I do hope, as you mentioned, Mr. Chairman, to persuade the Senate Committee on the District of Columbia, and later on, the full Senate, to adopt (for the District of Columbia) a comprehensive no-fault insurance plan.

Mr. Chairman, in the interest of conserving time, I would, with your permission, summarize my prepared statement and request that the full statement be entered in the record.

Senator HART. If there is no objection, the statement will be printed in full as though given.

Mr. Chairman, 2 weeks ago I presided over hearings of a subcommittee of the Senate District Committee on a system of first-party automobile accident reparations for the District of Columbia. As a result of work on a bill for one jurisdiction, I have some conclusions about the desirability of national no-fault legislation.

I came away from our hearings in the District with two principal conclusions: first, if a no-fault bill limited to the District were to pass, the people of the District of Columbia would be far better off than they are today; second, if a national no-fault bill were to be enacted, motorists in the District and throughout the Nation will be far better off than if the Federal Government confines its activity to pious, but toothless, pronouncements about the need for reform.

The District of Columbia needs no-fault because the fault system works just as poorly here as it does everywhere in the Nation. In return for his high premiums, the motorist gets spotty, inefficient benefits. If a motorist is involved in a minor accident, he is encouraged to turn his loss into a lottery ticket. He can expect to collect, with the help of an obliging lawyer, up to four times his economic loss. If on the other hand, he is one of those unfortunate victims with economic loss exceeding \$25,000, he will only collect 30 cents on the dollar—with or without a lawyer. Even worse is the staggering number of victims who receive absolutely nothing under the fault system. A DOT study of automobile deaths in metropolitan Washington over a 1-year period showed that in fully half of all the cases the survivors received not 1 cent from automobile insurance.

In order to buy this inadequate coverage, the motorist must pay \$7 in premiums for each dollar of compensation for economic loss not

Mr. Chairman, 2 weeks ago I presided over hearings of a subcommittee of the Senate District Committee on a system of first-party automobile accident reparations for the District of Columbia. As a result of work on a bill for one jurisdiction, I have some conclusions about the desirability of national no-fault legislation.

I came away from our hearings in the District with two principal conclusions: first, if a no-fault bill limited to the District were to pass, the people of the District of Columbia would be far better off than they are today; second, if a national no-fault bill were to be enacted, motorists in the District and throughout the Nation will be far better off than if the Federal Government confines its activity to pious, but toothless, pronouncements about the need for reform.

The District of Columbia needs no-fault because the fault system works just as poorly here as it does everywhere in the Nation. In return for his high premiums, the motorist gets spotty, inefficient benefits. If a motorist is involved in a minor accident, he is encouraged to turn his loss into a lottery ticket. He can expect to collect, with the help of an obliging lawyer, up to four times his economic loss. If on the other hand, he is one of those unfortunate victims with economic loss exceeding \$25,000, he will only collect 30 cents on the dollar—with or without a lawyer. Even worse is the staggering number of victims who receive absolutely nothing under the fault system. A DOT study of automobile deaths in metropolitan Washington over a 1-year period showed that in fully half of all the cases the survivors received not 1 cent from automobile insurance.

In order to buy this inadequate coverage, the motorist must pay \$7 in premiums for each dollar of compensation for economic loss not

otherwise compensated. In the District, the situation is aggravated by the 80,000 uninsured vehicles which threaten tourist, commuter, and resident alike.

For all of these reasons, the District needs auto insurance reform now. If a no-fault bill for the District were enacted, the District would be in a better position to meet the requirements of any national bill which might subsequently be enacted. Passage of a District of Columbia no-fault bill would have the added effect of putting the Congress on record in favor of no-fault. Either way, I view a District of Columbia bill as entirely consistent with the national bill which you are considering.

A no-fault bill for the District will be an enormous step forward, but it cannot solve the whole problem. Forty percent of the automobiles involved in accidents within the District are out-of-State vehicles, and only a few of these are covered by no-fault policies. If we allow these out-of-State motorists to sue in tort, the District motorists will be forced to assume an extra burden of liability insurance because other States have failed to reform their own systems. If we require out-of-State motorists to carry first-party coverage while driving in the District—as a number of witnesses have suggested—the need for District motorists to carry residual liability coverage would be eliminated in all but a small fraction of the cases. This would result in premium reductions for District motorists and out-of-staters alike, with motorists from surrounding areas of Maryland and Virginia benefiting the most. This solution will work well enough if only a few jurisdictions adopt no-fault systems. But what if, say, 20 or 25 jurisdictions—operating in the absence of any meaningful guidance from the Federal Government—adopt a whole array of reform bills? If the motorist is to comply with a new and different set of complex laws every time he crosses a State line, he may need a Philadelphia lawyer as a traveling companion. The problems posed by out-of-State vehicles were recognized by Assistant DOT Secretary Baker in his testimony on the District of Columbia no-fault bill. Mr. Baker testified that the out-of-State problems could “limit rather significantly the potential benefits” of a District of Columbia no-fault system.

I might add at this point that the administration's position on auto insurance reform is riddled with inconsistencies. The administration has acknowledged that auto liability insurance is far and away the most inefficient compensation system we have, and that the inefficiencies cost the motoring public billions of dollars and incalculable misery each year. It recognizes that further reform is needed in every State of the Union, and that in no State has the fault system been anything but a miserable failure. Yet, its only response to this massive national problem is a proposed concurrent resolution urging the adoption of no fault plans on a State-by-State basis. It tells the Commerce Committee about the wonderful world of State-by-State reform, while it tells the District committee that State-by-State reform will not work unless neighboring States adopt similar or compatible plans.

One does not have to be a political pundit to predict what is going to happen to no fault bills in States whose legislatures are dominated by lawyers and insurance men. In Connecticut, for example, a no fault bill was referred to a committee of the general assembly in which

lawyers outnumbered nonlawyers by a 15-to-1 margin. In Maryland, the deck was stacked almost as badly with lawyers outnumbering nonlawyers 21 to 2. One commentator, who has been following the insurance industry for 40 years, has observed that in such a committee a no-fault bill has about as much chance as a sheep in a packing-house.

Waiting for the lawyers and the legislatures they dominate to come out against the fault system is like waiting for the petroleum industry to come out against the oil depletion allowance. Auto accidents generate over a billion dollars a year in legal fees—fully one-fifth of all the income of the legal profession. Under the fault system, each year 50,000 lawyers receive more in legal fees than 5 million victims receive in benefits for economic loss not otherwise compensated for. The fault system may be inefficient in a number of respects, but it is not inefficient in providing lush incomes for trial lawyers. A study conducted by *Forbes* magazine last month showed that plaintiffs' negligence lawyers led all solo practitioners with an average income of \$71,000 a year. The article quotes one San Jose, Calif., trial lawyer as boasting that he has made \$1 million a year for the last 10 years.

It is entirely understandable that the trial lawyers would oppose reforms which will lower premiums and increase benefits at their expense. With billions of dollars on the line, it is clear that the vested interests opposing no fault will continue to fight tooth and nail. The administration proposes that these special interests be countered by a toothless resolution. This course of action may be the politically safe one with an election year approaching. It may enable the administration to have it both ways—so that it can say to the consumer that it is for no-fault, while implicitly assuring the trial lawyers that it will stand by while no-fault bills are killed in the State legislatures.

It took 40 years to achieve nationwide workmen's compensation reform through a State-by-State approach. We will be lucky if we can reform the auto accident reparations system in 40 years on a State-by-State basis. It is true that the present system is so bad that sooner or later public pressure will force even the most recalcitrant legislature to enact some reforms. But the question is whether we must continue to victimize the American motorist and all who must appear in our overburdened courts. I would submit that we have no excuse for perpetuating the excesses and rank injustices of the existing system. And if we want full reform of the system in this century, we have to have a national bill.

The Hart-Magnuson bill was an excellent initiative, and Committee Print No. 1 is even better. I might add that on a number of significant points witnesses at our hearings urged us to adopt the features of Committee Print No. 1, and we are giving very serious consideration to doing so. A nationally administered system such as that proposed by Committee Print No. 1 would be a very great improvement over the existing system.

If the choice were between a nationally administered system and the administration's State-by-State approach, I would unhesitatingly opt for the nationally administered system. But those are not only two possibilities.

There is much to be said for a strong national standards bill, under which the States would be given a reasonable amount of time—say 2

years—to enact a true no-fault system with high thresholds. If the State legislatures failed to adopt such a system within the 2-year period. Federal law would prescribe that the system would automatically come into effect and that it would be federally administered until such time as State action did occur. I am inclined to favor this approach because there are a number of important aspects of a no-fault system on which there is a legitimate difference of opinion about how best to proceed.

First, and perhaps most important, is the question of how to handle pain and suffering. It seems clear that we must do away with the unrestricted right to sue for pain and suffering and other forms of general damages in auto cases, but it is not so easy to decide what we ought to create in its place. The approach taken on Committee Print No. 1—requiring all insurers to offer first-party pain and suffering coverage on an optional basis—has much to be said for it. This approach permits each motorist to decide for himself whether he would rather have compensation for pain and suffering or lower premiums. But there is no way of telling at this point how much such coverage would cost, how much litigation it would generate, or how much high pressure salesmanship would be brought to bear on uninformed motorists to buy coverage they may not really want.

Another approach might be to require that pain and suffering benefits be awarded to certain classes of seriously injured victims under the mandatory first-party coverage on a scheduled basis. These awards would be for intangible loss and would be over and above the benefits recovered for medical expenses and lost income. Persons who wanted even more compensation for pain and suffering could be afforded the opportunity to take out optional first-party pain and suffering coverage at an extra cost. There are other possibilities as well, foremost among them being the approach taken in the Moss-Eckhardt national bill, which has been introduced in the House. We need practical experience to decide which of these approaches is best.

On the question of whether auto insurance should be primary or secondary with respect to other sources of recovery such as health insurance and wage continuation plans, there is also a significant amount of controversy.

Massachusetts and Florida have made auto primary, but they permit the motorist to elect a relatively high deductible on his auto policy so that he can have the benefit of a much lower auto premium if he also carries some form of private health insurance. This is also the approach which DOT recommended in their testimony before the Senate District Committee last month.

However, such an approach creates major enforcement problems because insurance agents, who receive a commission based on the size of the premium they sell, have no economic incentive to make the motorist aware that he can save money by taking a deductible on his auto policy. The results in Massachusetts indicate that for some reason very few motorists are electing the deductible, and President Jones of the American Insurance Association admitted before our subcommittee that “there is a record in Massachusetts which (does) not look good.”

It may be that there are some agents who out of the goodness of their hearts will help the motorist get the right coverage even though

it will mean a lower commission for them, but realism compels me to add that if you establish a system in which proper coverage will be offered only when the agents are willing to act against their economic self-interest, you are going to have major enforcement problems.

The approach taken in Committee Print No. 1 goes far towards making auto primary. There is, of course, a good deal of support for this position, but there are also important countervailing factors which argue for making auto secondary.

The two most important of these factors are premium savings and prevention of duplicate benefits. If auto is secondary, we can expect that the total premium an individual pays for his auto coverage and for his health insurance coverage combined will be less than the cost of that combined coverage would be if auto were primary. The reason for this is that even under a first-party auto system, auto insurance will return less benefits to the motorist per premium dollar than health insurance coverage does.

In addition, by making auto primary, we may well be creating a situation in which the auto accident victim collects twice—once from his auto policy and once from his Blue Cross or other health insurance policy. This will please the insurance companies because under the existing system they have every incentive to sell the individual as much insurance as they can—whether he needs it or not. But we do not do the motorist a favor when we force him to take out more coverage than he needs. Because under any insurance system the individual typically gets back less than a dollar in benefits for each dollar he pays in premiums, the result of overinsurance or duplicate benefits is that the individual is in a real sense less well off economically than he would be if he were covered only to the extent of his actual economic loss.

For those reasons, it may well be that the best way to find out exactly where the balance should be struck is by giving the States some latitude in dealing with the primary-secondary issue.

Finally, there is the question of whether automobile insurance ought to be offered through the private sector or by the Government. Committee Print No. 1 and all the major State no-fault bills have opted for continuation of the existing system in which all auto coverage is offered by private carriers. Despite the fact that the auto insurance industry is open to serious criticism because of its failure to press for reform, its failure to make insurance readily available to groups such as the elderly and the black, and its reluctance to pass cost savings on to its policyholders, I do not object to the continuation of the private enterprise system of marketing auto insurance.

By the same token, I do not see why a State which wants to adopt a Government-run insurance plan should not be given a reasonable opportunity to do so. The State-run plan in Puerto Rico has been a success. The premiums there are very low—about \$35 a year, and the system pays out 90 cents in benefits for each dollar taken in, far more than any private insurance plan can do. By making it clear to the insurance companies that they do not have a monopoly on a captive market, we can provide a powerful new stimulus to bring about reform within the insurance industry.

For all of these reasons, I believe that a national standards bill deserves very serious consideration.

This concludes my prepared testimony. Again, let me commend the committee for addressing itself ably and energetically to a vital and a difficult issue. I will, of course, be happy to answer any questions that members of the committee may have.

As you mentioned, Mr. Chairman, I have presided over hearings of a subcommittee of the Senate District Committee on first party automobile accident reparations for the District of Columbia. I come away from these hearings with two broad conclusions.

First, if a no-fault bill limited to the District were to pass, the people of the District of Columbia would be far better off than they are today.

Second, if a national no-fault bill were to be enacted, motorists in the District and throughout the Nation will be far better off than if the Congress confines its activity to pious, but toothless, pronouncements about the need for reform.

The District of Columbia needs no-fault because the fault system works just as poorly here as it does everywhere in the Nation.

In return for this high premiums, the motorist gets spotty, inefficient benefits, if he gets anything at all.

A Department of Transportation study of automobile deaths in metropolitan Washington over a 1-year period showed that in fully half of all the cases, the survivors received not 1 cent from automobile insurance. In order to buy this inadequate coverage, the motorist must pay \$7 in premiums for each dollar of compensation for economic loss not otherwise compensated.

In the District, the situation is aggravated by 80,000 uninsured vehicles which threaten tourist, commuter, and resident alike. For these reasons, the District needs auto insurance reform now.

If the no-fault bill in this District were enacted, the District would be in a better position to meet the requirements of any national bill that might subsequently be enacted.

Passage of a D.C.-no-fault bill would have the added effect of putting the Congress on record in favor of no-fault. Either way, a District of Columbia bill is entirely consistent with the national bill which this committee is now considering.

A no-fault bill for the District would be an enormous step forward, but it will not solve the whole problem. Forty percent of the automobiles involved in accidents within the District are out-of-State vehicles. This creates major problems, as the Assistant Secretary of Transportation Baker recognized in his testimony on the D.C.-no-fault bill. He testified that the out-of-State problems could "limit rather significantly the potential benefits of a District-no-fault system."

In his testimony before our committee, he recognized the difficulties which arise when different laws and different plans are in effect in different jurisdictions.

At that point, Mr. Chairman, the administration's position on automobile insurance reform becomes riddled with inconsistencies. It recognizes the difficulties which will arise from different automobile insurance plans and different jurisdictions. It also acknowledges that automobile liability insurance is far and away the most inefficient compensation system we have, and that the inefficiencies cost the motoring public billions of dollars and incalculable misery every year.

It recognizes that further reform is needed in every State of the Union, and that in no State has the fault system been anything but a miserable failure.

Yet, its own response to this massive national problem is a proposed current resolution urging the adoption of no-fault plans on a State-by-State basis. It tells the Commerce Committee about the wonderful world of State-by-State reform, while it tells the District Committee that State-by-State reform will not work unless neighboring States adopt similar or compatible plans.

One does not have to be a political pundit to predict what is going to happen to no-fault bills in States whose legislatures are dominated by lawyers and insurance men. In Connecticut, for example, the no-fault bill was referred to a committee of the General Assembly in which lawyers outnumbered nonlawyers by a 15 to 1 margin.

In Maryland, the deck was stacked almost as badly with lawyers outnumbering nonlawyers 21 to 2.

One commentator, who has been following the insurance industry for years, has observed that in such a committee a no-fault bill has about as much chance as a sheep in a packinghouse.

Waiting for the lawyers and the legislatures they too often dominate to come out against the fault system is like waiting for the petroleum industry to come out against the oil depletion allowance.

Auto accidents generate over a billion dollars a year in legal fees—fully one-fifth of all the income of the legal profession. Under the fault system, each year 50,000 lawyers receive more in legal fees than 5 million victims receive in benefits for economic loss not otherwise compensated for.

The fault system may be inefficient in a number of respects, but it is not inefficient in providing lush incomes for trial lawyers.

I might add, Mr. Chairman, that I am a former trial lawyer, I am a former lawyer-legislator, and I think in this case can testify from some personal experience. It is understandable that the trial lawyers would oppose reforms which will lower premiums and increase benefits at their expense.

With billions of dollars on the line, it is clear that the vested interests opposing no-fault will continue to fight tooth and nail.

The administration's course of action may be the politically safe one. It may enable the administration to have it both ways, so that it can say to the consumer that it is for no-fault while implicitly assuring the trial lawyers that it will stand by while no-fault bills are killed in the State legislatures. But it is not the right course of action.

It took 40 years to achieve nationwide workmen's compensation reform through a State-by-State approach. We will be lucky if we can reform the auto accident reparation system in 40 years on a State-by-State basis.

In response to some earlier remarks by the very distinguished ranking minority member of this committee, Mr. Chairman, it is my understanding that of the States which have acted recently in this field, there are now in the whole Nation only two which have even partially done away with the fault system; namely, Florida and Massachusetts.

The present system is so bad that sooner or later public pressure will force even the most recalcitrant legislature to enact some reforms. But why we must continue to victimize the American motorist and the injured pedestrians, and all who must appear in our overburdened courts, is the real question.

I would submit that we have no excuse for perpetuating the excesses and rank injustices of the existing system. If we want reform of the system in this century, we have to have a national bill.

The Hart-Magnuson bill was an excellent initiative and Committee Print No. 1 is even better. I might add that on a number of significant points witnesses at our hearings urged us to adopt the features of Committee Print No. 1, and we are giving very serious consideration to doing so. A nationally administered system such as that proposed by Committee Print No. 1 would be a very great improvement over the existing system.

If the choice were between a nationally administered system and the administration's State-by-State approach, I would unhesitatingly opt for the nationally administered system. But those are not the only two possibilities.

There is, I believe, much to be said for a strong national standards bill, under which the States would be given a reasonable amount of time, say 2 years, to enact a true no-fault system with high thresholds. If the State legislatures failed to adopt such a system within the 2-year period, Federal law would prescribe that the system would automatically come into effect and that it would be federally administered until such time as State action did occur. I am inclined to favor this approach because there are a number of important aspects of a no-fault system on which there is a legitimate difference of opinion about how best to proceed.

First, and perhaps most important, is the question of how to handle pain and suffering. It seems clear that we must do away with the unrestricted right to sue for pain and suffering and other forms of general damages in auto cases, but it is not so easy to decide what we ought to create in its place. This approach permits each motorist to decide for himself whether he would rather have compensation for pain and suffering or lower premiums. But there is no way of telling at this point how much such coverage would cost, how much litigation it would generate, or how much high pressure salesmanship would be brought to bear on uninformed motorists to buy coverage they may not really want.

Another approach might be to require that pain and suffering benefits be awarded to certain classes of serious injured victims under the mandatory first-party coverage on a scheduled basis. These awards would be for intangible loss and would be over and above the benefits recovered for medical expenses and lost income. Persons who wanted even more compensation for pain and suffering could be afforded the opportunity to take out optional first-party pain and suffering coverage at an extra cost. There are other possibilities as well, foremost among them being the approach taken in the Moss-Eckhardt national bill, which has been introduced in the House. We need practical experience to decide which of these approaches is best.

On the question of whether auto insurance should be primary or secondary with respect to other sources of recovery such as health insurance and wage continuation plans, there is also a significant amount of controversy.

The approach taken in Committee Print No. 1 goes far toward making auto primary. There is, of course, a great deal of support for this position, but there are also important countervailing factors which argue for making auto secondary.

The two most important of these factors are premium savings and prevention of duplicate benefits. If auto is secondary, we can expect that the total premium an individual pays for his auto coverage and for his health insurance coverage combined will be less than the cost of that combined coverage would be if auto were primary. The reason for this is that even under a first-party system, auto insurance will return less benefits to the motorist per premium dollar than health insurance coverage does.

In addition, by making auto primary, we may well be creating a situation in which the auto accident victim collects twice, once from his auto policy and once from his Blue Cross or other health insurance policy. We don't do the motorist a favor when we encourage or force him to take out more coverage than he needs. Because under any insurance system the individual typically gets back less than a dollar in benefits for each dollar he pays in premiums, the result of overinsurance or duplicate benefits is that the individual is in a real sense less well off economically than he would be if he were covered only to the extent of his actual economic loss.

For these reasons, it may well be that the best way to find out exactly where the balance should be struck is by giving the States some latitude in dealing with the primary-secondary issue.

There is the question of whether automobile insurance ought to be offered through the private sector or by the government. Committee Print 1 and all the major State no-fault bills have opted for continuation of the existing system in which all auto coverage is offered by private carriers. But I don't see why a State which wants to adopt a government-run insurance plan should not be given a reasonable opportunity to do so. The State-run plan in Puerto Rico has been successful as far as I can tell. The premiums there are very low, about \$35 a year, and the system pays out 90 cents in benefits for each dollar taken in, far more than any private insurance plan can. By making it clear to the insurance companies that they do not have a monopoly on a captive market, we can provide a powerful new stimulus to bring about reform within the insurance industry.

For all of these reasons, I believe that a national standards bill deserves very serious consideration.

Senator HART. Thank you, Senator.

I think I will reserve questions, but I suspect I reflect the feeling that you are speaking in a balanced fashion, recognizing that there are competing claims—I am not talking about accident claims—that there are several principles seemingly in conflict here, and you make the suggestion that a desirable way to resolve them is to permit the States, opting on a minimum set of standards that we would prescribe, to experiment.

In the bill that you are urging the District Committee to report out, how do you handle the general damage or pain and suffering?

Senator STEVENSON. Mr. Chairman, I was impressed during our hearings with the complexity and the legitimacy of the various points of view that were brought before our committee.

In the bill as originally introduced, we eliminate the pain and suffering tort altogether, except for certain very serious injuries. I, however, would like to see the subcommittee which I chair very seriously consider changing to a requirement that the insurance companies do offer insurance for pain and suffering on an optional basis to the motorist, leaving it to the motorist to decide whether or not that coverage is worth it to him.

We haven't, in the subcommittee, gone into a markup session yet, and I don't know what form the bill will finally take. I would not be at all surprised, however, to see the present provision changed in the course of our sessions within the subcommittee, and that is one possibility.

Another, of course, would be to schedule the benefits for pain and suffering, but I think the weight of the testimony at least favored a requirement of pain and suffering coverage for District motorists, but leaving it optional, making it possible for the motorist to acquire that coverage or not as he saw fit.

Senator HART. In the District Committee testimony, you didn't find any strong plea that we establish a government-run insurance plan which you suggest any State ought to have reasonable opportunity to establish if it wants to? You didn't get any plea that we do that, did you?

Senator STEVENSON. There wasn't any testimony favoring such a plan for the District. The District of Columbia government, as well as the administration, supports basically the bill that we introduced which contemplates continued use of private insurers. Not being concerned with other jurisdictions or the national approach, we just didn't receive any testimony on that particular question.

Senator HART. Senator Cotton.

Senator COTTON. May I join the chairman in commending you on an excellent statement.

With reference to my remarks, I think you misunderstood what I was saying. I did not assert that seven States had adopted a total "no fault" system. I said seven States, plus Puerto Rico, had adopted some form of the type of insurance commonly called no fault insurance.

May I say this to you, Senator: I am in accord with seven-eighths of what you have advocated in your testimony. I agree with you, and I want to make my position very clear on this. It is not my suggestion that the Congress withhold action in this field and wait to see if State-by-State 50 States finally come into line. I would be inclined to agree with your statement that it would be a good many years.

I also agree with what you stated, at least by implication, that each year we wait a large number of people are suffering from inadequately compensated accidents, and if something should be done it should be done in the reasonably near future. In other words, it is not just a pious expression, as you phrase it, that reform should come.

My own feeling is that reform should come and should come soon. I have had some experience working within the present system. In my years of active trial work, I defended insurance companies and spent a good deal of time trying automobile cases in a small way because I was a country lawyer. I have had the same experience that you have had.

I have a very strong feeling, and I have said this very frankly to lawyers and representatives of insurance companies in my own State, that we are operating under an antiquated system and that reform must come.

I believe a subcommittee of the House Interstate and Foreign Commerce Committee has had hearings, as a practical matter, on a similar bill but has not met to report it to the full committee. It is my further understanding that even if the bill is ordered reported by the full committee, the Rules Committee of the House has indicated it is not granting a rule on any more legislation for the remainder of this session unless it is a matter of appropriation or some dire emergency. Therefore, I want to make it clear that the Senator from New Hampshire isn't saying, "Let's wait and see if the States will on their own volition move in this field." The Senator from New Hampshire is merely saying, "We will probably have to wait until the next Congress anyway, as a practical matter, so during that time we should have the benefit of the experience of the States gained under the various forms that they have adopted. If this is done, we will be able to frame a much more effective and intelligible bill next Congress.

I have a feeling that I will be thoroughly in favor of Federal action by that time, because I think we will know more about the experience of these various States.

I wanted to make that clear, and also that I am not in fundamental disagreement with the distinguished Senator from Illinois.

Senator STEVENSON. That is very encouraging to me, Senator. I thank you for clearing up what I was trying to say about the seven States. There are two that, strictly speaking, have abolished the fault system. In other States, including my own State of Illinois, there are hybrid reforms under which motorists now do receive were first-party coverage, but fault still exists as a means of apportioning losses between the insurance companies. Fault is still a part of the system in Illinois, and the result is you are not going to get appreciable savings in insurance costs in Illinois.

As I say, the Senator's remarks are very encouraging to me, and I should think a national standards law would not only encourage uniformity within the States which the administration recognizes is important, but it might also encourage the action which we all seek in the States which in turn will give the Congress more experience to study.

Senator COTTON. I have just one more question.

It is my understanding that your suggestion is, if and when Federal legislation is adopted, that it might allow States on their own volition to go into State insurance rather than leaving it in the hands of private insurance companies, but it is not your suggestion that Federal legislation should prescribe that.

Senator STEVENSON. Oh, no, sir. I was suggesting minimum standards which would permit the option of a State-run plan such as Puerto Rico has.

Senator COTTON. Thank you.

Senator HART. Senator Cook.

Senator COOK. Thank you very much, Mr. Chairman.

Senator, before I ask questions, there is one correction I would like to make, and I think it is in the record. You said, "Persons who

wanted even more compensation for pain and suffering could be afforded the opportunity to take out optional first party pain and suffering coverage," and I think you said at no extra cost. I think you must have meant at an extra cost.

Senator STEVENSON. I certainly did not mean to say that.

Senator COOK. I think that should go into the record so it is not on that basis.

I like very much the suggestion that States be given a period of time in which to do this. I can foresee if we do not follow this course that we could have a ratemaking agency in the Nation's Capital that would be as big as the Pentagon, and I am afraid they really can't comprehend and understand many of the problem that you and I face with almost every Department of the Federal Government with regard to situations that arise in our States.

I think the State insurance commissioners have put out an exceedingly fine case as to their ability and as to the efficiency of State agencies in the operations that they carry on now.

The one thing that did bother me was your indication that the Puerto Rican system is working well. I think the American people should be aware of conceivably what they will run into, and this is one of the reasons that I thought more hearings on this were necessary.

You are aware of the fact that under the Puerto Rican system tort liability still exists for any amount of recovery over the basic coverage?

Let me give you an example. In Puerto Rico, for example, the loss of one eye in an automobile accident allows a recovery of \$5,000. The loss of both eyes allows for a recovery of \$7,500.

Now, I am sure that every insurance company in the United States would love to settle their claims as fast as they could settle them either on a \$5,000 or a \$7,500 basis, but I am quite sure that we would be doing the American people a tremendous disservice.

You indicated in your District of Columbia bill that you were eliminating the tort factor. If you eliminate the tort factor, are you taking into consideration some really responsible schedule, because frankly I don't think I could recommend to anybody that the Puerto Rican schedule at this stage of the game for \$35 a year would be responsible? The total recovery, for instance, for death in the State of Puerto Rico system is \$15,000.

Now, again I don't believe that you or I could recommend such a schedule to the American driver and to the American economic standards. Do you agree with that?

Senator STEVENSON. Senator, the survivors of half of the people killed in automobile accidents in the District of Columbia recovered nothing for death. I think the citizens of this country want to be assured of a prompt and a fair recovery for the deaths of their loved ones and for their own injuries, and they want to pay as little as is possible for the insurance coverage.

You get into a tradeoff situation: How far do you go to limit the recovery for pain and suffering in exchange for prompt and adequate coverage at a minimum cost? It seems to me one way of striking that balance is to provide the motorist with the option of taking out from an insurance company as much first party pain and suffering coverage as he wants, perhaps according to several schedules of benefits.

I wouldn't deprive him of that coverage. I would give him the option. Many motorists, I don't know how many, none of us know, might very well opt for no such coverage, and save the premiums.

Senator COOK. I agree wholeheartedly with what you say, but the point I wanted you to bring out, and you did, is what we are really talking about is a minimum coverage under no-fault with the opportunity for the insured to carry as much additional coverage as he desires. Secondly, you also recommend that the Federal Government set the standards and allow a period of time by which the States shall act or shall be covered by the Federal program if they fail to act. This would operate in favor of a continuation of the State insurance departments in the operation of this under an edict to reform or be controlled by the Federal Government?

Senator STEVENSON. That is basically what I am suggesting in the national standards approach, leaving it among other things for the States to determine what kind of coverage should be made available within their jurisdictions for pain and suffering.

Senator COOK. Good.

Thank you, Mr. Chairman.

Senator HART. The Senator from Maryland.

Senator BEALL. Thank you, Mr. Chairman.

Senator STEVENSON, as one who has spent most of his adult life selling insurance, I find myself in basic agreement with your statement. I think that no-fault insurance is not only bound to come but it should come as soon as possible. I do think, however, that it would probably work out better in the long run if we followed your suggestion and allowed the States sufficient time to put in their own plans with perhaps a pretty heavy Federal hand laying in waiting in the background.

I am wondering, first of all, if you think 2 years is sufficient time to allow the States to come up with plans of their own as a result of your experience.

Senator STEVENSON. Senator, I think so. This debate has been going on for years and years and years. I remember first hearing about the whole issue when I was studying law in law school.

I think to get some action, we ought to have a short deadline, and if real problems do arise at the State level meeting that deadline, the Congress can take another look at the terminal date.

Senator BEALL. Another question which bothers is the fact that I felt that rate reduction comes about generally through accident prevention, and it has been my experience, and I think statistics bear this out, that in a great number of the accidents across the country, alcohol is involved.

Now, if we rely on normal legal procedures or the normal State enforcement when we deal with alcohol, it takes a lot of time before a person is determined to have been using alcohol or not to be using alcohol.

Insurance companies, who have been subjected to some criticism because of this, perhaps rightfully in some instances, have as a result of their own investigative procedures said to some individual, "You have a known record for using alcohol, and we are not going to give you any insurance." In that way they have helped to deal with accidents.

I wonder how much, and maybe you don't want to deal with this question today because it deals with specifics, but I wonder if it wouldn't be wise to give some discretion to whoever writes the insurance, whether it be a State plan or private industry, to establish certain standards which would take into consideration the use of alcohol, because it is such an important factor in accidents across the country.

Senator STEVENSON. We did go into this question in the hearings held before the District subcommittee, the whole question of how you deter careless, negligent driving, and we went into the question of what to do about the alcoholic driver. The bill that I have introduced only requires the issuance of the insurance to licensed motorists.

If an insurance agency or an insurance company has knowledge that a motorist is unfit to drive, I should think it would be entirely possible for the insurance company to make that known to the licensing authorities in the jurisdiction, and perhaps the license should be lifted. The company would then be relieved of its obligation to offer the insurance to the motorist.

But it seems to me, getting back to your question, Senator, that you are touching now upon a problem that best be left to the States to resolve under a national standards approach, the States which license the drivers, the States which regulate the insurance companies, the States which control the traffic on their highways.

Senator BEALL. One final question: Since the District of Columbia hopefully is about to adopt a no-fault insurance plan, do you think that this plan can succeed for any length of time or be successful for any period of time unless Maryland and Virginia also have such plans? I would suspect that the highest proportion of drivers in the District of Columbia, and perhaps the highest proportion of those involved in accidents, come from outside the District.

Senator STEVENSON. I have been looking forward to telling you what a great thing this would be for the State of Maryland.

Senator BEALL. That is the reason I asked you the question.

Senator STEVENSON. I believe it will work more effectively if Maryland and Virginia both adopted no-fault plans. It raises some problems for us. What do you do, for example, about the Maryland motorist in the District? Should he be required to amend his policy to take out no-fault insurance to cover him while driving in the District, or do you require the District motorist to retain some residual tort liability coverage for accidents with out-of-State motorists?

We also have the problem of the District motorist in Maryland, too, and what his rights and obligations are under the law of your State. I don't know which way we are going to come out, but it looks to me as if no matter what way we come out, everybody in the adjoining States is going to benefit from a no-fault law in the District. No-fault insurance is cheaper.

We could have a very quick effect on the premiums for automobile insurance in both Maryland and Virginia. It could be, and we received testimony from representatives of the insurance industry which indicated that there would certainly be no additional insurance cost in Maryland and probably there would be, and quickly, reductions in insurance cost in Maryland when and if the District adopted the no-fault insurance.

But there are these problems which could best be resolved either by the national bill or by State-by-State bills which did follow some standards and were uniform within limits.

Senator BEALL. I thank you.

Senator COTTON. May I ask one more question?

Senator HART. Yes.

Senator COTTON. This is not an argumentative question. It is for information. Have you considered in the case of national legislation the matter of rates?

Parenthetically, I might say that New Hampshire is probably the best and nicest State in the Union to live in; our accident record is pretty good and except for some cold winter mornings, it is a safer and more delightful place to live.

The rates that insurance companies set for New Hampshire motorists are considerably more favorable than insurance rates set for those who live in metropolitan areas. I have been compelled to have—even though I sometimes wish I didn't—two cars.

I insure them both in New Hampshire. But I also am compelled to disclose that one of those cars, at least 10 months of the year, will be in Washington.

Under the rules of the insurance company, approved by the insurance department, I pay a much lower rate on the car that stays in New Hampshire than I pay on the car that is here in Washington 10 or 11 months out of the year, depending on whether we ever adjourn.

What is your suggestion in the face of national legislation which sets up criteria? Would you recognize that differential, and how would you do it?

Senator STEVENSON. First, Senator, let me just suggest to you that if you support this no-fault insurance bill for the District of Columbia, you will soon be paying a lower premium for your District car than for your New Hampshire car.

But I am assuming, and I haven't gone into this particular question under the national standards approach, I had assumed in thinking about it that the determination of rates would remain with the State insurance commissioners and that those rates would reflect the experience under no-fault in the respective jurisdictions, and, therefore, your premiums in New Hampshire under no-fault would remain relatively lower than no-fault premium rates in other parts of the country.

Senator COTTON. In other words, you are suggesting the type of legislation that sets up certain criteria but does not attempt to cross every "t" and dot every "i" in the matter of insurance rates, and how the States shall handle the no-fault system?

Senator STEVENSON. Yes, sir; that is basically what I am suggesting as a positive alternative to the Hart-Magnuson approach.

Senator COTTON. Thank you.

Senator HART. The Senator from Tennessee.

Senator BAKER. Thank you. I apologize to you and the committee and to Senator Stevenson for arriving late, especially since I was, in part at least, instrumental in asking for these additional days of hearings.

I especially wanted to hear Senator Stevenson's testimony because he perhaps has been more intimately involved in the evolution of these concepts and the advantages of no-fault insurance and pitfalls than any other Member of the Senate by virtue of his work on the Senate District Committee.

Senator STEVENSON. I don't think that is true at all. I have had hearings recently on a subcommittee for the District Committee on District insurance.

Senator BAKER. I think the suggestion I am told you made in your statement bears a good deal of thorough examination, and I won't belabor the record now except to say that I appreciate the ideas that you have expressed and I will consider them very carefully.

I thank you for bringing your previous experience on this issue to this committee. I have nothing further, Mr. Chairman.

Senator HART. Again, Senator, thank you.

I think you have introduced a note that may have rather broad appeal to the committee, the concept of Federal standards, and a time certain within which compliance by the States will be required.

Our next scheduled witness is a member of the American Trial Lawyers Association, and it happens to be an old friend of mine from law school days at Ann Arbor. We welcome Mr. Craig Spangenberg.

STATEMENT OF CRAIG SPANGENBERG, AMERICAN TRIAL LAWYERS ASSOCIATION, CLEVELAND, OHIO

Mr. SPANGENBERG. Thank you very much, Senator Hart.

Senator HART. There is some indication—

Mr. SPANGENBERG. Mr. Wolfstone and I were going to testify together. I have to go back to Cleveland, and Leon has allowed me to testify first.

I have a statement that is not different in essentials from matters which have been put before the committee before, and rather than read that statement, let me turn to what I think is the real heart of the problem.

Senator HART. Let me inquire whether there is objection to printing the statement in full in the record.

Mr. SPANGENBERG. I would want the statement printed in full, but let me just expand on parts of the statement, Senator.

I was on the DOT Legal Advisory Committee for 2 years, and I am on the Advisory Committee of the Conference of Commissioners and have been actively studying no-fault proposals for 4 or 5 years for the American Trial Lawyers, and I have also conducted an international seminar for the International Academy of Trial Lawyers to find out how others handle the problem.

Senator COTTON. Will you please put that mike a little nearer.

Mr. SPANGENBERG. The system around the world generally is that there will be no-fault benefits for every victim of every automobile accident in some amount. The amounts vary from country to country. In every other country in the free world the innocent victim who is in the right or who is seriously injured or injured at all by someone in the wrong gets full compensation under a tort system with a right to trial. Seldom a trial by jury but a trial by judge.

The countries that have recently changed their reparations systems have adopted the same kind of plan. Manitoba now is on that kind of

plan as is Ontario, Sweden, West Germany, Norway, France, and England have had the plan for many years.

The hard-core problem and the problem that this committee should deal with is not at all the victim of the small injury or the small claim. I think the DOT studies make it abundantly clear that very little money, regardless of percentage, is paid out to the average claimant. Fifty-six percent of all victims, as you know, receive less than \$500 for everything—wages, medical, pain and suffering. And the average payment to this under \$500 class is down around \$200, \$230.

The hard core of the problem is what should be done about a very small number of victims of very serious or fatal accidents. The DOT studies, and I am sure, Senator Hart, you are quite familiar with them, because you have quoted them in one of your articles, show that a small group of 45,000 people altogether, which is about 1 percent of the annual total injured, have enormous loss. Their losses, that small number, average \$76,000; that is, the medical and future wage loss. Many of them are fatal, of course, where a high future wage loss counts very heavily.

Under the present tort system, a great many of these people do not recover at all. Now, that is said to be a criticism of the tort system, although I think it is not, if you will bear in mind that about one-third of the fatal cases involve a drive leaving the road and hitting a tree or running into a bridge abutment, many of them very high speed collisions, many of them drunken collisions. Half of all fatalities involve alcohol, not a social drink but very heavy alcohol consumption.

So the question is if a fellow decides he is entitled to risk his own neck and drives at high speed and hits a fixed object and is killed, first, should he be paid? If so, who is going to pay him? Third and most important, do you make the good driver pay for that loss?

Of the two-thirds who are not single car semisuicides, in the normal course of affairs, some of them will be in the right and some will be in the wrong.

One of the DOT studies, the price variability study, looked into a set of cases of very heavy loss. This is in the tort system where there is liability. There was a series of a little over 50 cases. Half of them were drivers who had driven to the wrong side of the road. These usually serious, heavy injury collisions, where you get head-on collision signals or stop signs. Some of those at high speeds, too—100-mile-an-hour crashes; 80-mile-an-hour crashes.

In that kind of crash where one driver is clearly right, driving properly on his side of the road, and the other is clearly wrong, both may receive similar injuries. The question is should the system that you design pay the full amount to everyone who is injured in that way? Your bill does that, the Committee Print No. 1 does that.

But let me point out to you what that will cost. Let us take the whole gamut of seriously injured people as the DOT defined it. That is the 500,000 serious and fatal cases.

DOT studies said personal and family loss was \$5.1 billion but with a note that it does not include young people and students about to enter the earning market. If you include those young people, the economic loss is \$6 billion a year.

I note that Committee Print No. 1 does pick up the man about to enter the wage earning market. You do not freeze him to last year's earnings as one of the other bills does.

That means for this class of very seriously injured victims, the economic loss total to be compensated is about \$6 billion. The present tort system pays only \$813 million plus another quarter of a million in medical pay and so forth to this group as a whole.

Two reasons for that: first, a third of the victims killed or injured themselves by very bad driving in which the tort system should not be expected to pay for it. Of the remainder some were clearly wrong, like this series of wrong side of the road, running stop signs, who should not be expected to recover under the tort system.

Of the balance in the right, standard liability loss coverage, they run into \$10,000 limits. If they have a \$100,000 loss they are not going to get it. That is not because the fault system is wrong; that is because we have too low limits. Germany says 68,000 U.S. dollars minimum limit. We are more likely to say here 10 or 12. England says it does not cost much more for unlimited liability. So if you drive in England, you are insured for \$10 million. Again, we have not followed that practice in our liability system, although I see we go into it in the no-fault system under this bill.

What will be the result of that? If under the tort system you are saying there is \$6 billion in economic loss for this handful of people, and you are now paying them out of the tort system \$1 billion, then obviously you must say it will cost at least \$5 billion a year to pay their economic loss in full, which you are trying to do. You are never going to get more than 40 percent efficiency out of the insurance system. You do not get that now out of the collision insurance system which is no-fault-first-party-don't-investigate primary liability, which means that what you are saying is the American motoring public will have to pay \$8 billion a year or in that neighborhood additional premiums each year to pick up the economic losses of these people who hit abutments and hit trees and drive on the wrong side of the road.

Now, if the American people want to do that, fine. I do not object to it, but I think they ought to know that that is what you are thinking about.

Perhaps more—not more important, equally important is the shift in costs. The bill puts a great deal more cost into the system and therefore you have to get a lot more premium out of the buyers. Let me point out some other areas in which you are now going to shift cost and make the good driver pay more.

I must disagree with the good Senator from Illinois who says that the District no-fault bill would cost less for the good Senator from New Hampshire. I now assume the good Senator from New Hampshire is a reasonably good driver and is not on a high risk, alcoholic assigned risk plan.

Senator COTTON. I insist that it appear in the record. [Laughter.]

Mr. SPANGENBERG. If that is so, you will have to pay more even if the premiums do not increase at all. The reason for that is quite simple. Again from the price variability study, two rather renowned experts, Brainard and Carbine, say that their investigations indicate that if a man is endowed to any degree with the power to differentiate between right and wrong, if he has any conscious control of conduct, which they

believe, if individual responsibility exists, then the prevalent cause of accidents and especially the serious and high risk accidents lies in a failure to control what must be considered controllable driver hazards.

It is the authors' position that cost variability is attributable to the failure of a relatively small segment of the market to exercise the care which lies within their power to exercise, and this failure which is individual is the fault with which the tort liability system concerns itself.

They then go to point out that a few drivers that are bad risk are charged high premiums, not quite as high a premium as they should in view of their bad risk record.

The vast majority of drivers, however, are charged very low premiums, that is, if you are a good driver, all that is being rated is your risk of hitting someone else and being at fault. I can give you a quick example on that. On property damage, which is third-party liability automobile damage, the difference between a 1-A risk and a 2-C risk is about 4-to-1. Now, if you go into first party, you no longer rate the risk of being a bad driver and hitting somebody; you rate two risks: what are his chances of hitting somebody, and what are his chances as a good driver of being stopped at the light and getting hit?

So you find then in collision insurance the spread in rates is about 2-to-1 instead of 4-to-1. When you change the risk of being hit, even though a good driver, the capacity for loss is substantially higher. Therefore, the rate changes.

The result of this, according to Brainard, is if your premium level remained exactly the same under no-fault, two-thirds of the drivers would have to pay higher premiums than they do now, one-third of the drivers would pay lower premiums than they do now.

There is some confirmation of that in Manitoba, which did shift to a partial no-fault system, and in Manitoba the figures are 64 percent of the drivers have to pay a higher premium, 36 percent pay a lower premium. That is, the no-fault system has to impose higher cost upon the good driver who then has to subsidize the losses of the bad driver.

Again, if that is what the American people want, fine, but I think the American people should realize that at least two-thirds of them are now classified as reasonably good drivers. It will make some difference, I suppose, as to the State in which you live. There is an annual compilation by the DOT of accident rates which is quite interesting.

It shows that the national average of injury accidents on all highways—State, Federal, rural, urban, secondary, primary—is 257 losses per 100 million vehicle miles of driving. Some States run very close to that national average.

If you are interested, Senator Cotton, New Hampshire averages 250 per 100 million miles, a little better than the national. The Senator from Tennessee lives in one of the safest States there is, only 168 accidents per 100 million miles in Tennessee, so the Tennessee driver ought to get a much lower rate.

We hear a great deal of the experience in Massachusetts. I might say that Massachusetts is so far out of line with any other State in the Union that I do not know how you can draw any conclusion from Massachusetts, because at the time they went to no-fault their injuries per 100 million miles were 604 against a national average of 257. My

own analysis of that is if you are interested in why it happened is simple. They went to compulsory bodily injury coverage, 5/10, back in 1927. They have never had compulsory property damage.

Over the course of decades the population has been well trained: if you are hit in the rear end, don't say: "You hurt my fender," rather, "You knocked the stop lights out of my neck." So they are repairing a lot of fenders with neck claims.

I would expect that the Massachusetts injury claim now that they have shifted over to a different system would show lower injury claims, higher property claims. In fact, if you look at what has happened in rates in Massachusetts, you will find that property damage rates went up one-third, personal injury rates went down one-sixth. But the collision rates and property rates are about two-thirds of the premium, which means that the motorist who was promised rate benefits from no-fault gets two-thirds of his premium increased by one-third, he gets one-third of his premium decreased by one-sixth. He winds up paying a higher overall premium.

I do not think you can look at these systems and just take one part of it. It is an overall system.

The other way in which Committee Print No. 1 will impose a far heavier load upon the average good automobile driver is that you have now changed the original approach which said the heavy truck should pay a higher premium, and you are saying now there is to be no consideration to the fact that the truck outweighs the passenger car 20 tons to 2, and the truck imposes much higher injuries when it is at fault than the passenger car does.

As to the incidence of loss—these figures I received from the Alliance—the incidence of loss per million vehicle miles for their insureds for private automobiles was 3.8. The incidence of loss rate for the trucks was 12.4. That is, the truck not only inflicts more loss, the truck has a much higher incidence of loss.

What happens when a car hits a truck? For these figures, if you will forgive me, Senator Hart, I quote your article in *Trial Magazine* in the October/November 1970 issue where you gave statistics that I have not seen in the DOT publications, saying in 1968, in truck and passenger car accidents—this was about half of the truck collisions, that is, about half the incidents in which trucks are involved in accidents involve trucks and passenger cars—in that series, truck-passenger car accidents, truckdrivers were killed in 16 instances, while car passengers were killed in 1,017. That is, the death rate between the car passenger and the truckdriver is in the ratio of 63 to 1.

Now, under the present system, the tort system, the heavy truck, the commercial truck does pay a substantially higher premium. Once you go to a system in which the automobile driver has to pay for his risk of loss, the average motorist now must pick up the tab for these 63 car passengers killed and the trucking company should get a much lower rate, because the truckdriver very seldom is either killed or injured.

That switch from the original version of a surcharge on the heavy vehicle to no surcharge on the heavy vehicle adds necessarily a rather heavy cost rate to your system, and it is a cost rate, again, the private automobile driver is going to have to pick up.

Senator Cook. Mr. Chairman, I have to leave. I am wondering if I might ask one question if no one objects.

Senator HART. Go right ahead.

Senator COOK. Are you saying in effect that today the young unmarried driver, under 25, finds it very difficult to get insurance coverage?

Mr. SPANBERG. He pays a higher rate.

Senator COOK. If we go to a system of no-fault with extended coverage over and above this, because this is a limitation on first party coverage, you are saying that it will be very easy for a company to write him since there will be no responsibility as to a wife, children, high income. If we go to this kind of system, the individual who needs extended coverage for the benefit of his family may find it very, very difficult to get that extended coverage. The young driver with no liabilities, with no problems except his automobile, would just be duck soup to be covered. They will be delighted to cover him, because he will be covered under this no-fault and they will pay him what he wants. Let's walk down the street. We go to the young man who has no liabilities. All he has is his automobile. There are no problems. We have got first party coverage and we write it right away. However, if we go down the street to a fellow who has a family with five kids, a wife, a \$50,000 a year job, we must be very careful because our liabilities now will become just the reverse of what they are today.

Mr. SPANBERG. Exactly right. What you say is completely true. There is another effect to it which you should bear in mind. When you change the system that way—take a 17-year-old, unmarried male, no driver training, today he is the worst hazard on the highway.

All the statistics prove that he has the most enormous risk of loss. But he becomes a pretty good risk under the new system because he has no dependents. If he kills himself, as he is likely to do, the insurer pays nothing. There will be no medical if he is DOA except the ambulance bill, and he will have no dependents.

So he is a great risk if he is killed. But if he doesn't go off the outside of the curve, if he crosses over the inside of the curve, as in this series, 80-mile headon, and kills somebody, under the present system he pays the high premium for that risk, while you pay the low premium.

Now, if you reverse it, the good driver has to subsidize that bad driver. He will get a low premium, but since the loss is still in the system, who picks up the loss? The good driver. You not only change the rates drastically, but then the man who is in the good classification now has to pick up that cost.

Again, the mathematics, why it comes out that way—I am not enough of an actuary to say, but certainly Brainard, is a renowned authority, and he has said in the same magazine in which your article appeared Senator Hart, that he calculated with rates exactly the same, the rate change would be 65 percent. These are the good drivers who will have to pay a much higher premium for the no-fault as contrasted with the 35 percent of high risk drivers. That is, with the rates the same, 65 percent will pay higher rates and 35 percent will pay a lower rate than now. I am sure you will have actuaries who will confirm that has to be so. Under the DOT statistics with the small class of serious injuries, once you put \$5 billion more cost into a system for which you pay \$8 billion more in premiums necessarily to get the \$5 billion out, against the system which is only charging \$4.9 billion in premiums now, what is going to happen to your rates is going to be fantastic.

own analysis of that is if you are interested in why it happened is simple. They went to compulsory bodily injury coverage, 5/10, back in 1927. They have never had compulsory property damage.

Over the course of decades the population has been well trained: if you are hit in the rear end, don't say: "You hurt my fender," rather, "You knocked the stop lights out of my neck." So they are repairing a lot of fenders with neck claims.

I would expect that the Massachusetts injury claim now that they have shifted over to a different system would show lower injury claims, higher property claims. In fact, if you look at what has happened in rates in Massachusetts, you will find that property damage rates went up one-third, personal injury rates went down one-sixth. But the collision rates and property rates are about two-thirds of the premium, which means that the motorist who was promised rate benefits from no-fault gets two-thirds of his premium increased by one-third, he gets one-third of his premium decreased by one-sixth. He winds up paying a higher overall premium.

I do not think you can look at these systems and just take one part of it. It is an overall system.

The other way in which Committee Print No. 1 will impose a far heavier load upon the average good automobile driver is that you have now changed the original approach which said the heavy truck should pay a higher premium, and you are saying now there is to be no consideration to the fact that the truck outweighs the passenger car 20 tons to 2, and the truck imposes much higher injuries when it is at fault than the passenger car does.

As to the incidence of loss—these figures I received from the Alliance—the incidence of loss per million vehicle miles for their insureds for private automobiles was 3.8. The incidence of loss rate for the trucks was 12.4. That is, the truck not only inflicts more loss, the truck has a much higher incidence of loss.

What happens when a car hits a truck? That switch from the original version of a surcharge on the heavy vehicle to no surcharge on the heavy vehicle adds necessarily a rather heavy cost rate to your system, and it is a cost rate, again, the private automobile driver is going to have to pick up.

Senator Cook. Mr. Chairman, I have to leave. I am wondering if I might ask one question if no one objects.

Senator HART. Go right ahead.

Senator COOK. Are you saying in effect that today the young unmarried driver, under 25, finds it very difficult to get insurance coverage?

Mr. SPANGENBERG. He pays a higher rate.

Senator COOK. If we go to a system of no-fault with extended coverage over and above this, because this is a limitation on first party coverage, you are saying that it will be very easy for a company to write him since there will be no responsibility as to a wife, children, high income. If we go to this kind of system, the individual who needs extended coverage for the benefit of his family may find it very, very difficult to get that extended coverage. The young driver with no liabilities, with no problems except his automobile, would just be duck soup to be covered. They will be delighted to cover him, because he will be covered under this no-fault and they will pay him what he wants. Let's walk down the street. We go to the young man who has no liabilities. All he has is his automobile. There are no problems. We have got first party coverage and we write it right away. However, if we go down the street to a fellow who has a family with five kids, a wife, a \$50,000 a year job, we must be very careful because our liabilities now will become just the reverse of what they are today.

Mr. SPANGENBERG. Exactly right. What you say is completely true. There is another effect to it which you should bear in mind. When you change the system that way—take a 17-year-old, unmarried male, no driver training, today he is the worst hazard on the highway.

All the statistics prove that he has the most enormous risk of loss. But he becomes a pretty good risk under the new system because he has no dependents. If he kills himself, as he is likely to do, the insurer pays nothing. There will be no medical if he is DOA except the ambulance bill, and he will have no dependents.

So he is a great risk if he is killed. But if he doesn't go off the outside of the curve, if he crosses over the inside of the curve, as in this series, 80-mile headon, and kills somebody, under the present system he pays the high premium for that risk, while you pay the low premium.

Now, if you reverse it, the good driver has to subsidize that bad driver. He will get a low premium, but since the loss is still in the system, who picks up the loss? The good driver. You not only change the rates drastically, but then the man who is in the good classification now has to pick up that cost.

Again, the mathematics, why it comes out that way—I am not enough of an actuary to say, but certainly Brainard, is a renowned authority, and he has said in the same magazine in which your article appeared Senator Hart, that he calculated with rates exactly the same, the rate change would be 65 percent. These are the good drivers who will have to pay a much higher premium for the no-fault as contrasted with the 35 percent of high risk drivers. That is, with the rates the same, 65 percent will pay higher rates and 35 percent will pay a lower rate than now. I am sure you will have actuaries who will confirm that has to be so. Under the DOT statistics with the small class of serious injuries, once you put \$5 billion more cost into a system for which you pay \$8 billion more in premiums necessarily to get the \$5 billion out, against the system which is only charging \$4.9 billion in premiums now, what is going to happen to your rates is going to be fantastic.

I would expect the rates would go up on the order of at least twice, probably $2\frac{1}{2}$ percent, though the actuaries can probably tell you that better than I can. I am just taking gross from the DOT statistics.

Senator COOK. Do you mean $2\frac{1}{2}$ percent?

Mr. SPANGENBERG. Two and one-half times.

Senator COOK. You said $2\frac{1}{2}$ percent.

Mr. SPANGENBERG. Excuse me. Two and one-half percent, we would not worry about. If you are paying the \$40 rate for bodily injury now, which is probably about the median for good drivers across the country, depending on what State in which you live, you can figure you will pay perhaps \$100.

In the States with much higher risk, like Massachusetts and New York which is a bad State on accident rates, and the District of Columbia which isn't very good either—you have a very high accident rate in the District of Columbia, close to 400 injuries per 100 million miles—in those cases the rate pickup on losses will increase very greatly.

Senator COOK. Thank you, Mr. Chairman.

Mr. SPANGENBERG. Again, I suppose, Senator, it is a little odd for a trial lawyer to be talking about really actuarial matters, but I think someone in this hearing room ought to speak up once in awhile for the individual consumer, the fellow who is buying the policy now.

On that subject, it might—I would suppose that the Senators would be interested in knowing what their constituents really want. There is sometimes a temptation to do what you think is good for people and you find out that the people really don't want to be "done good to" in that way. The public attitude study of DOT describing not the compensation or insurance problems of cancellations and nonrenewal, but the fault system itself, put this question: "Under most States the system now is if you are in an accident you have to show the other driver alone is at fault; if you do, you get your losses.

Do you think that is a good system or bad system?

Those who said "good" system outweighed "bad" system $2\frac{1}{2}$ to 1, which is pretty strong evidence that people believe in fault.

Then they went on. "Do you think the system should be changed?"

Sixty-eight percent, no. That is about seven out of ten, and of those three out of ten, on the question "how should it be changed," another one out of 10 said go to comparative negligence, that is, weigh the fault and reimburse proportionately, which would mean on those figures that eight out of 10 American people are saying the proper system is a fault system or a comparative negligence fault system.

That doesn't say they like cancellations, but that is a different problem. That is what the insurance industry has been doing. I would like to see closer attention paid to insurance company bad practices. The fault system itself doesn't necessarily have to have bad practices connected with it.

I hope I am not overly sensitive in pointing out that there is a great deal of criticism of the lawyer, but so far as I can find from reading the complaint letters, the criticism of lawyers isn't coming from people. It is coming from the insurance industry, who would certainly like to get rid of every lawyer in the country.

Then they could beat down the claimants even better than they do now.

Who gets the lawyer, and what does he do? It is the individual who goes out and hires him. But 60 percent of the people don't. They can settle on their own. It is only when they get into a tangle with the insurance company where they can't settle that they go to the lawyer.

When they go to the lawyer, the result of that is that about 5 percent of all injured people ever get a lawsuit filed—those are the DOT statistics, too—and about one-third of 1 percent ever go to verdict.

So, the verdicts are setting a standard for the cases filed that are settled without verdict which set the standard for the cases the lawyer has because someone hired him, but are settled without even filing a lawsuit, and those, in turn, set the standard for the 60 percent of the people who are able to settle without a lawyer at all.

I would hope you don't pass S. 945, Committee Print No. 1, on the argument it will avoid court congestion. The argument I am now making it, I hope you appreciate it, you are only using 17 percent of court time for automobile cases now for setting the standard. You are using about three times as much to protect the individual rights of the Manson gang and revolutionaries, and a whole class of muggers and rapists and car thieves, that is, the real congestion is on the criminal side, as I am sure you know.

It is perfectly proper to spend the time for the individual constitutional rights of those people, I don't quarrel with that. But I say they are a very small class. To say that you will use a third as much time to determine the right of 100 million American people who drive about 100 million licensed vehicles a trillion miles a year, by using 17 percent of court time isn't saying you are abusing the system or wasting your assets.

In fact, the professor who did the litigation study told us in the final meeting of the advisory committee that he viewed the litigation system as very efficient rather than inefficient, because he viewed it as a standard setter. He is the one who told us how few cases ever use the court system for verdict. But the effect of that, then, is to determine the rights of everybody else, including property damage rights as well as the injury rights.

I think in view of the time, Senators, that I would rather like to know what is on your minds. I have covered some other points in my prepared statement. One I would emphasize is that I do take some exception to the staff analysis of Committee Print No. 1 which said that if you take away the rights of the man who was right, who was innocent and who is disabled, which the bill does just to make it cheaper, if you take those rights away, we will let him go out and voluntarily buy a policy so that he can purchase those rights he now has as a birthright as an American citizen. In that way, the staff analysis says, we will let free market forces determine whether he really wants it. I must disagree with that analysis.

If you say here is something you now have because you are an American, we are going to take it away, and then let you buy it to see whether you really want it, I think you are saying the same thing that I would say if I said, "Let's see if American people want to vote. Take away the right of the ballot, but let every voter buy one for \$50."

Then we will let free market forces determine whether he really wants the right to vote.

Secondly, if you are dealing with this kind of system in which you have a compulsory high cost base and then say you may buy the other coverage on top of the base, certainly, you disadvantage all the poor. don't you?

They have to pay more as good drivers than they do now. They simply will not be able to find in their budget room for the voluntary coverage. The man of considerable means can. I don't think you are going to find out whether people want it, you are going to find out whether people can afford to buy the extra coverage, which is a different question.

In that sense, the provision I think is quite discriminatory.

Senator HART. Remember Senator Stevenson said he heard about this basic problem when he was in law school?

Mr. SPANGENBERG. I didn't. We didn't. I didn't hear about no-fault plans seriously until Professor Keeton's tract came out, and then the great push in 1968 from AIA.

But that was the year in which AIA had heavy underwriting losses, the stock companies, and they felt they knew how to compete with health and accident insurance, they obviously were not competitive with casualty insurance, so we had the great drive by AIA on that subject.

You know, the AIA plan was presented with an analysis that its plan with limited benefits would cost 25 percent less than present casualty coverage.

The Alliance Actuaries then took the same data and said: "You have made some mistakes. It would cost 29 percent more than the present coverage." Your bill contains substantially more benefits than the AIA bill, and if these actuaries are right about the extra cost of the original AIA bill, I think you will find that the bill, S. 945, is going to be a double premium cost type of bill.

Senator HART. In addition to disagreeing with Professor Keeton, do you to the same extent disagree with the Department of Transportation?

Mr. SPANGENBERG. Which one of their recommendations? Some of their statistics I think are on an adequate basis.

Senator HART. Their recommendation is, let's have no-fault and soon but let the States do it. Do you agree or disagree?

Mr. SPANGENBERG. The final recommendation of DOT is that the situation is far more complex than anyone thought when we started the study. I agree with that, that we ought to try no-fault, that probably will do some good, but we don't know whether it will or not.

Senator HART. Do you agree with that?

Mr. SPANGENBERG. I think we ought to try it. No-fault is already here. Medical pay is no-fault insurance.

Remember, DOT said if you implement it, stage 1, probably just try taking care of medical with it, see how that works. Well, we have some experience now with first party medical pay. It seems to work quite well, and it is fairly inexpensive.

Stage 2, pick up some of the wage loss.

Stage 3, limit general damages, but they say throughout you probably should keep the tort system for the seriously injured man, though their definition of serious injury is far milder than the 70 percent permanent and partial disability—the 70 percent figure of the Stevenson

bill means if you lose one leg, you don't get paid, you have to lose two.

Indeed you have to lose two above the knee to get up to 70 percent. The DOT serious injury is a much lower classification than that. They say that is for stage 3.

Stage 4, put in property damage. They warn you may find along the way the costs too much, it is too inequitable, and people don't like it. But they say save your present method while you experiment, so you can get back to it if this doesn't work.

Do I agree with that?

Indeed I do. I have closed my statement to you by saying there may be some fairly useful no-fault systems. I would like to see it tried with a compulsory rider on every liability policy that would pay in full the total economic loss of 90 percent of all accident victims, and start with that and see if it works.

I think it will take a lot of junk cases out of the system. Then, you might want to expand it, and say if we can pay for 90 percent and it doesn't increase rates, suppose we adopt a level where we pay for the total economic loss of 96 percent of all the victims.

If you pay in full the total economic loss of 90 percent of all victims of automobile accident injuries in the United States today, you only need a \$1,000 rider. I think you can start with that without disrupting anything. The actuarial figures I have seen say you can buy that for about \$8. This is not going to impose any great obligation upon the poor driver.

If you go up to covering 96 percent of the total loss of all victims, you only go to \$2,500. I think at stage No. 2, try that.

I have written that, I welcome your study of it. But to me that is far different from saying that we are on the top of the cliff and the water looks nice, let's dive in, with total payment of all loss for everybody under a system in which nobody is liable for anything he does in an automobile, but everyone gets substantially full economic loss.

That is a total revolution. It is a total destruction of rights that American people think are dear, and it is an act that may involve you in inability to get back to a system that does work in part at least. It may be so costly that the cries of outrage will be overwhelming. If you are going to dive off from the cliff into that water, the good swimmer goes down and wades around first, and swims and sees whether it is 3 feet or 50 feet deep, and whether there are any rocks there.

That is what DOT is recommending to you, and that is what I am urging on you, too, to stage it piece by piece to see if it does work, because I am quite convinced that the kind of plan that you have in S. 945 is not within the bounds of economic possibility for most drivers.

If you say on the other hand: "What do you do about the fellow who does drive off the road and hits the tree" He does what he did before. He buys life insurance. In all the studies of what they didn't get from the tort system, you will find they got fairly substantial recovery from social systems, from medicare, from Blue Cross, from Blue Shield, from employment wage continuation plans, from pension plans, and from life insurance. Those are all available no-fault systems that are there today, available on a voluntary basis. People want it and buy it.

You can expand that market, but that is quite different from saying for their own good we will compel people to buy it and at the same

time we compel people to buy it, we will not undertake to control the rates that the industry charges. In fact, we will allow the industry, completely exempt from the antitrust laws, to fix prices, for a compulsorily purchased product.

I don't like that approach.

Senator HART. The Senator from New Hampshire?

Senator COTTON. Just one quick question.

Do I gather that you are inclined to believe that the no-fault system can and perhaps should prevail in the case of comparatively minor accidents, but that when you get into the type of accident in which damages run very high, you are liable to run into grave difficulty in trying the no-fault system out?

Mr. SPANGENBERG. Yes, when I said I thought the limit of benefits that would pay 90 percent of the victims can be very economically provided under a no-fault plan, you must understand the other 10 percent would get that same limit of benefits, that is, throughout the world and here I think no-fault and fault can coexist. They do today.

In other words, you can have a level of no-fault for which you get back something for your insurance dollar, and you can combine it with the system that says if you risk not just your neck, somebody else's neck, then you are responsible and liable for what you do. The two systems coexist. They do all over the world, and they can here.

Does that answer your question?

Senator COTTON. Yes, that answers the question.

Mr. SPANGENBERG. I want a coexisting system. I think no-fault will take all of the small cases out of the system.

Senator COTTON. Are you talking about both personal injury and property damage?

Mr. SPANGENBERG. I have serious questions about property damage from the standpoint of selling that to the public. Can I elaborate for just a second on that as to what you are likely to run into as a Senator?

Senator COTTON. Yes.

Mr. SPANGENBERG. To the American today, I am sure the automobile is an extension of his personality. When he gets hit in the rear end, he says, "You hit me." even though he wasn't hurt at all, it is just a dent in his car; but his car is himself in a very real sense. You hit me. He wants the fellow who hit him to pay his damages.

The response is, "Don't worry about it, my insurance company will pay for it." That satisfies the social problem. You hit me. I am to blame. But my insurance company will now pay for it. Fine.

So, there isn't much social warfare left after that has happened.

Now, you are saying if the fellow is at the light and he gets crunched from the rear; he says "You hit me." The other driver says, "It is not my fault. The Senator says I am not responsible for what I do. This is a statistical incident. So, I am not going to pay you at all." That leaves the fellow very angry. What can he do? What he must do is go buy his own collision coverage. The amounts involved are not large, but the principle is very important and I think when the American motorist finds out that under your bill he is—

Senator COTTON. It is not my bill.

MR. SPANGENBERG. Excuse me, under Committee Print No. 1 he can't collect one dime from the fellow who creams him from the rear, that the screams of outrage are going to be heard in Washington without need of long-distance telephone amplification.

I don't think that is psychologically workable.

SENATOR COTTON. So you are inclined to believe that the no-fault system can be applied to personal injury accidents up to a certain amount?

MR. SPANGENBERG. It can be applied to all of them. The benefits should be limited as to all of them. The level should take care of almost all of them, completely. Beyond that, let the man buy voluntary coverage to increase his recovery if he is completely in the wrong. That is, I want the wrongdoer to pay the extra premium and to be rated by the insurance companies. What are the chances of wrapping your car around the bridge abutment? I want him to pay the high premium for this. I don't want to pay for it.

For too many years I have never wrapped a car around the tree or injured anyone else. I enjoy a good premium rate because of that, as I am sure most of you do. I want to be rated as a good driver. I don't want to subsidize all the bad drivers on the road.

SENATOR COTTON. Assuming what you just said, that no-fault can coexist with the fault system, you draw the line first that no-fault would only apply to personal injury; and second, it would compensate for personal injury only up to a certain amount, after which the person injured would have his usual right to seek more through the tort liability system.

MR. SPANGENBERG. Yes, if he were in the right and suffered real injury, yes.

SENATOR COTTON. He would have his usual right to proceed to obtain more under the present system, which presently supposes he was not guilty of contributory negligence and he was in the right?

MR. SPANGENBERG. Yes.

SENATOR COTTON. To that extent they can coexist?

MR. SPANGENBERG. Yes.

SENATOR COTTON. And to that extent they can save both for the insurer and the insured the cost of investigation and other expenses in comparatively minor cases?

MR. SPANGENBERG. It would not cost any more than the present system, and there are reasons it should cost less. I hope you appreciate my point that the system we have just described in our conversation back and forth is the system that works, and works well; so their people tell me, in Manitoba, in Ontario, in Sweden, in Norway, in West Germany, and in France and in England—and in Puerto Rico; that is a dual system in Puerto Rico.

You still retain the tort suit. You do get first-party benefits.

SENATOR COTTON. And where do they draw the line in some of these places on the amounts?

MR. SPANGENBERG. Manitoba, Sweden, France, Germany, England—no line, no threshold.

They find that small cases just don't come into the system. If you just don't have much injury, it isn't worth arguing about it, if you get your bills paid. I think a great many small claims are made now

like the "Massachusetts fender"—if you want to get your bills paid; they don't pay you. And you say if they don't, I'll sue you for my backache. You really have a backache, but you would be willing to forget it if you just got your bills paid.

That has certainly been the experience with the other systems. If you do pay the full losses to the small claim, he walks away and forgets it. That happens. You don't mandate that it be so. You don't need to. But I think—forgive me if I tell you this, I don't think you have enough medical knowledge to draw a threshold plan. I have seen some of them. "Loss of limb." Now what do you mean by loss? Does it have to be off? Loss of limb means disarticulation at the shoulder or hip, really.

How about the fellow who cannot turn his arm because he has a shoulder joint injury? He doesn't lose the limb. It might be paralyzed, without "loss" of limb. Brain injury is worse. All your limbs are there, they are just not any good to you.

Permanent disability. This high-speed man comes out from the other side of the road, hits you, and you have a lacerated liver, a lacerated spleen. I want to tell you you are going to be sick if you survive. If you get to the hospital on time and they can remove the spleen, which you won't miss too much if you are over 15—it is an organ that the young need more—you may survive. A lacerated liver, you may survive. The liver will regenerate, but you will be sick and in great pain. But if you survive and your liver regenerates after 2 or 3 months, you will not have permanent disability.

Are you going to say to that fellow that he wasn't entitled to anything because he did not lose an eye, lose a limb?

I think you overemphasize loss of a piece of the body instead of looking at what happened to the individual. Was he really terribly hurt? Was part of his life taken away from him?

Senator COTTON. I regret to say that in my trial days I lost some rather substantial verdicts on our old friend sacroiliac. One doctor would come in and say he had it and another would say he didn't have it, and the fellow would dance a jig.

Mr. SPANGENBERG. Did he? Did he dance a jig?

I have had some of these where 2 years later he went into surgery and they found he had a disc. It is now found to be a cartilage injury of the intervertebral joint that affects the sciatic nerve by putting pressure on it, and the surgical results are not very good.

I have an advantage over you, Senator, I have a ruptured disc. I know it is painful.

Senator COTTON. A ruptured disc can be ascertained pretty definitely, can't it?

Mr. SPANGENBERG. It is ascertained clinically. You do a myelogram only if you have decided you are going to operate, because the myelogram itself is dangerous. There is some death and disability rate from the myelogram. That tells whether you should operate at L-4 or L-5 or L-3, but the diagnosing of disc is done by most skilled orthopedic men today by symptoms.

Senator COTTON. I know a doctor who can determine whether you have a ruptured disc—

Mr. SPANGENBERG. Under "no fault," the fellow says my back hurts too much to work today. So you pay him. "My back hurts" is the only standard. If he wants surgery, he can get it. You pay for it.

I hear the statements, "we can pay out this money in 30 days." The things we are litigating now are, was he really hurt? Was he hurt in this accident? Did he have an old ruptured disc that he got back or an old back sprain? Is he laying it on too much and goldbricking? Does he hurt so much that he cannot go back to work as he claims? Or is he pretty well recovered but just wants the vacation paid for by the insurance company, in which case the insurance doctor usually is very optimistic and says, he is well and he can go back to work today.

Senator COTTON. Under the "No-fault" system, you have the same problem that you have now.

Mr. SPANGENBERG. You sure do. Those questions about the extent of injury, the necessity of medical, how much medical each should have, how long you stay off work; don't think you avoid those with No-fault. You have that same problem of determining the injury under either system, and it will be costly—

Senator COTTON. You avoid some under no-fault since you have limited damages.

Mr. SPANGENBERG. That depends on your system. Committee Print No. 1 is unlimited medical, wage loss unlimited for life up to \$1,000 a month, which is a pretty high proportion of the working population, surely, of the whole population of the United States.

Senator COTTON. So, as Senator Cook brought out, in Puerto Rico, if you lose the sight of both eyes under that system you would get \$7,500.

Mr. SPANGENBERG. Right.

Senator COTTON. You would certainly have the right, if you lost the sight of both eyes, to go back and seek more somewhere.

Mr. SPANGENBERG. I think you do under Puerto Rican law, if the other driver is in the wrong. You get that anyway, but you still retain the tort suit. That is a coexisting system.

Senator BAKER. Mr. Chairman, I have to leave to keep an important commitment at 1 o'clock. It is a little after 1 now. I apologize to the witness for having to go.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. I understand from your testimony that your main concern is the victim of a large loss. That was the first point in your testimony.

Mr. SPANGENBERG. No.

Mr. SUTCLIFFE. That is not your concern.

Mr. SPANGENBERG. You said my "main concern." That is a concern.

Mr. SUTCLIFFE. I wonder if you could pick up the DOT report there and turn to page 37 and read the sentence at the top of that page, please, for the record.

Mr. SPANGENBERG. "Furthermore, while tort theory says that qualified innocent victims are entitled to compensation for all their losses, both tangible and intangible, even successful tort claimants with serious injuries, who presumably also suffered serious intangible losses, do not on the average recover even their economic loss."

I explained that to you, I think, by saying you have said the average loss for the seriously injured class was \$76,000, but your mandatory liability limits are only 10, and the answer is to increase those limits.

Mr. SUTCLIFFE. That would be one answer, to try to take care of the low recovery. But nonetheless, what we are trying to ascertain

here is the difference between the present system and a proposed change in that system.

The proposed change in the system would bring you to the level of economic loss recovery for all accident victims; is that correct?

Mr. SPANGENBERG. It depends on the plan. Committee Print No. 1 does; yes.

Mr. SUTCLIFFE. That is what we were considering today. Would you read what the ratio of net recovery with a tort claim is on the opposite page?

Mr. SPANGENBERG. I don't think I have to. I think that was 30 percent if the loss were \$25,000 and over.

Mr. SUTCLIFFE. Thirty percent?

Mr. SPANGENBERG. Point 3.

Mr. SUTCLIFFE. The ratio is 0.3, so the percentage would be 30 percent.

What would it be if you didn't have a tort recovery? If you suffered over \$25,000 of loss, were seriously injured; how much would you recover if you didn't have the tort claim?

Mr. SPANGENBERG. Under what plan?

Mr. SUTCLIFFE. This is the existing situation today.

Mr. SPANGENBERG. Well, under the present system that says in the very large loss, he recovers 30 percent of his loss from his other first-party benefits and he recovers 30 percent from his tort benefits on average. He is recovering 60 percent.

Mr. SUTCLIFFE. I think the figures show if you have a tort claim or if you don't have a tort claim and you are seriously injured, over \$25,000, the average recovery is 30 percent of your net economic loss.

Mr. SPANGENBERG. Sir, I think you are completely misreading that chart. This chart shows what percent of recovery comes from tort and what percent of recovery comes from sources not tort.

For example, the \$1,500 claim, you get twice the recovery—the economic loss with tort because you are getting general damages, but you also get 100 percent without tort.

Mr. SUTCLIFFE. Perhaps we are arguing over semantics at this point.

Mr. SPANGENBERG. You can't say that a \$25,000 man gets nothing from tort, can you?

Mr. SUTCLIFFE. No, he gets an average of 30 percent of his economic loss.

Mr. SPANGENBERG. From tort.

Mr. SUTCLIFFE. What would Print No. 1 give him for his economic loss?

Mr. SPANGENBERG. I suppose that the number of those injured who will have wage loss in excess of \$1,000 a month is very small, maybe 5 percent. I would guess you are saying in Committee Print No. 1 that you propose to pay 95 percent of the total economic loss to this whole class of seriously injured victims.

Mr. SUTCLIFFE. You had one other point.

Mr. SPANGENBERG. That is why I say I think you are saying that the motorist will now have to pay \$8 billion a year more in premiums in order to do it.

Mr. SUTCLIFFE. Let me ask you, you say by making an option for intangible loss under the committee print that you are denying the person rights that he has as an American citizen?

Mr. SPANGENBERG. I say you are taking away rights that he now enjoys freely.

Mr. SUTCLIFFE. How can you say that in light of the fact that under the present system for seriously injured accident victims he recovers only an average 30 percent for economic loss and nothing for intangible loss?

Mr. SPANGENBERG. Sir, you say this as though a statistic were a person. Let me tell you, I have represented many poor people whose only protection in life is to drive carefully, who have gotten smashed by heavy trucks or by high-speed drivers, who have recovered 100 percent of their economic loss.

Those people exist. I can give you case and book on many of them. If you are fortunate when you get hit, you will be hit by a big truck. Then you have no problem about a collectible defendant. If you are hit by someone who has only \$10,000 in insurance, then you are in serious trouble.

All these statistics are saying is that many drivers are under-insured for liability.

Mr. SUTCLIFFE. Aren't the statistics also saying in terms of the dollars available to compensate people for losses resulting from tragic automobile accidents, that not very many dollars are getting to the seriously injured accident victim?

Mr. SPANGENBERG. You say that the liability dollar is there to pay compensation to the victim. I don't think the present system was ever designed or intended to pay compensation to the 80-mile-an-hour drunk who goes off the road, travels 120 feet in the air, rolls over three times and winds up dead. That is a very high proportion of your seriously injured and fatality cases.

Mr. SUTCLIFFE. But of those people who are eligible for tort recovery, 42 percent, according to the Department of Transportation's statistics, the average recovery is 30 percent of the economic loss.

Mr. SPANGENBERG. That is right. But the man who is liable is under-insured.

Mr. SUTCLIFFE. But nonetheless, that is the situation today. To increase that 30 percent to 95 percent does not seem to me to be taking away a right of an individual in this society.

Mr. SPANGENBERG. Well, I would suppose, sir, that you could just put out that everyone in the United States has to buy \$150,000 worth of life insurance at whatever premium the life insurance cost him, and in that way you would get \$150,000 for everyone who is fatally injured.

If you say you must go out and buy first-party coverage to cover your own risk-taking whether you want to or not, instead of being protected as the poor man is now by saying if I drive carefully and don't hurt somebody else and somebody hits me, I have got a good chance of being paid, at least I will get something.

Under your voluntary coverage, if the poor man can't buy it, he don't get anything for his lifetime disability or disfigurement. He has to pay that coverage under your system. The first party coverage—you are not giving him anything, you are compelling him to buy it. No insurance company gives away benefits. They sell it to him. Mutual of Omaha doesn't give you health and accident benefits. They sell it.

I just don't follow you when you say this system gives you benefits. This system gives you nothing. This system says you go buy it.

Mr. SUTCLIFFE. And the liability system does not?

Mr. SPANGENBERG. No, no, no, it does not. The liability system says you have a right to life, liberty, and the pursuit of happiness. Everyone must use due care not to take that right away, and you must take care not to take your neighbor's right away, and if you do—if you do take that right away, you must pay full compensation for it.

That is all the liability system says. That is the tort system. Take care not to take away your neighbor's rights, which you are liable for.

Mr. SUTCLIFFE. How is that right reflected in the purchase of liability insurance?

Mr. SPANGENBERG. It isn't. You may want to spread the risk of being liable by buying liability insurance. There are many vehicles on the road who are called politely self-insurers, who never buy insurance at all; but are insured by their companies who are fully collectable. They find it cheaper without paying 40 or 45 percent over to the insurance company. Liability has nothing to do with insurance.

Mr. SUTCLIFFE. Liability has nothing to do with insurance, did I hear you say?

Mr. SPANGENBERG. Yes; you are talking about two different systems.

Mr. SUTCLIFFE. Haven't they been married under our present automobile reparations system?

Mr. SPANGENBERG. Well, they are at least very good friends. They are going together.

Mr. SUTCLIFFE. Your concern is for the innocent victim?

Mr. SPANGENBERG. My concern is for the innocent American who drives right and follows the rules of the road and stops at stop signs and at red lights and stays on his side of the yellow line, and gets clobbered by someone who breaks the rules.

Mr. SUTCLIFFE. You are not willing to accept the average of 30 percent of that particular person's economic loss if he is seriously injured?

Mr. SPANGENBERG. Mr. Sutcliffe, I would very much like to see you increase the mandatory liability insurance coverage limits to something like they have in Ontario or Germany. I think our citizens are entitled to that much protection. I think it is shameful that we tolerate just a 10-20 coverage as being enough if you buy liability insurance.

Statistically, on liability insurance, where you are not paying everybody but only those who are innocent, the cost of increasing coverage to those levels is really quite small.

Mr. SUTCLIFFE. What recommendation would you make for a limitation on contingent fees if that liability coverage were increased?

Mr. SPANGENBERG. I have long advocated that there should be judicial control of contingent fees.

Mr. SUTCLIFFE. At what level?

Mr. SPANGENBERG. Well, this will depend on whether a case, if it is very difficult, if it is small chance of recovery requiring a large investment in time, I think a contingent fee of 40 percent would not be unreasonable. If it is a case that is easy, simple, you can't lose, the contingent fee should be low.

I don't charge an average contingent fee. I charge a contingent fee that relates to the case. It may be 20 percent in one case.

Mr. SUTCLIFFE. In these other countries, are there contingent fees?

Mr. SPANGENBERG. They say not. If you go check what happens in Ontario, you will find that although the lawyer is supposed to charge cash in advance, he doesn't. When the case is over, he goes to court and says I think I should be paid ratably for my work and result, and he comes out of there with a 25- or 30-percent contingent fee which he doesn't try to collect if he loses. The idea that they don't have a contingent fee in Ontario is just a paper idea.

In fact, it is contingent. In fact, the poor man can't get good counsel unless there is that kind of a fee.

I note your limitation of 25 percent on the voluntary coverage. That doesn't bother me a bit. That is a case you can't lose. If he has the coverage, you have got to win. So, you are saying 25 percent with no chance of loss for determining how badly he is injured and what it is worth. That doesn't trouble me. I think it is a little different if there is a good chance of losing. If you think a contingent fee is abused, provide for court control by judges in the system.

There are places where it is not abused, as I am sure you know, and perhaps somewhere it is. If it is abused, control it.

Senator HART. If there isn't any objection, and because of our obligation to attempt to proceed to as many witnesses in as orderly fashion as we can today, I wonder if there would be objection to reserving further questions, and those questions would be submitted in writing for reply to the record.

Mr. SPANGENBERG. I would be happy to answer in writing any questions that are submitted.

I have overstayed my leave.

Senator HART. There were many other things we would like to develop.

Mr. SPANGENBERG. Thank you very much for your time and attention, Senator Hart and Senator Cotton.

(The statement, and questions and answers follow:)

STATEMENT OF CRAIG SPANGENBERG, AMERICAN TRIAL LAWYERS ASSOCIATION

Thank you for allowing me to come before you again today.

The proper function of the legal system, in any government, is to define and protect the rights of the individual citizen. The proper function of the insurance industry is to evaluate the risks the legal system imposes, and offer risk-spreading insurance at reasonable rates to individual citizens who want protection against major loss. It is not in character for the writer, as a lawyer, to give advice on how insurance companies are to be run—but is equally out of character for the American Insurance Association to demand that fundamental rights of individual American citizens must be obliterated in order to assure a comfortable, profitable life for the stock insurance companies. We used to believe in this country that government and business should serve the rights of the individual, rather than *redesign* the rights of the individual to serve the needs of the private insurance industry.

Americans have long believed in the self-evident truth that every individual "is endowed by his Creator with certain unalienable rights, and among these are the rights to life, liberty and the pursuit of happiness." The intangible values of life, including freedom from crippling disability, freedom to enjoy normal activities and pleasure, and freedom from agonizing pain, are nearly as valuable as life itself. Tort law is founded on the natural principle that the unalienable rights to life, liberty, and the pursuit of happiness cannot exist unless every member of society exercises some care to protect his neighbor's rights. The fault system rests on the bedrock concept that there is a difference between right and wrong, and if one man carelessly injures his fellow man by wrongful conduct, the innocent victim ought to be compensated for *all* his losses, and the wrongdoer

should be liable for the losses he has caused by violating the rule of careful conduct.

Private insurance, on the other hand, is totally unconcerned with concepts of right and wrong. It charges premiums to spread the risk of loss, and is supposed to pay the loss when it occurs. "No-Fault Insurance" is just a Madison Avenue selling term for an old, familiar kind of insurance that has long been on the market. It does not "give" any benefits. It simply sells benefits, for a price the insurance industry calculates is enough to pay for its expenses, its profits, and the benefits or "losses" it contracts to pay. "No-Fault" insurance is either expensive or cheap only in a relative sense. It is expensive if it contracts to pay heavy benefits, and cheap if it pays few benefits. If a particular No-Fault Plan is set up to pay full compensation to all drivers, right or wrong, it has to cost about twice as much as a plan set up to compensate only those drivers who were right. The typical No-Fault Plan is set up with a No-Pay Plan, in order to keep costs down. Senate Bill 945 is no exception to the general rule. It is a No-Fault, No-Pay combination.

The essential feature of S. 945 is that it totally abolishes every natural right and every legal right of the American motorist. It abolishes the duty to drive with any care. It abolishes all responsibility and all liability of the reckless drivers who violate the rules of the road.

In simple terms, if a driver properly stops at a red light and is then smashed from the rear by a driver who ignores the light and the traffic (over 40% of all accidents according to D.O.T. studies) the driver in the wrong is not responsible. The driver who crosses the yellow line and hits another car head-on is not liable. The cab driver who runs a stop sign and injures his passenger in the resulting collision is not liable. (There is a small exception. If the driver who hits you is committing a felony at the time he is liable for the damage to your car and for general damages, but not for your medical bills and wage loss.)

What does S. 945 give back in return for the inalienable rights, the birth-rights of American citizens, which it takes away? It requires full compensation for *all* losses for a very small group of citizens. It sets up a special class of those who do not own a motor vehicle and are not wife, husband, or dependent of a vehicle owner. This group will include some persons of considerable wealth who live in New York City apartments and have given up trying to drive or park a car in that metropolis. It will also include the very poor, who cannot afford even the oldest used car, and doubtless some elderly widows who never learned to drive. Inasmuch as there are about 100 million registered motor vehicles and about 100 million licensed drivers in the United States, the class of non-owner and non-dependent or non-spouse of an owner is necessarily small. This limited class is highly favored. If a member of this group is injured by an automobile, regardless of the circumstances, the insurer of the automobile must pay all wage loss, all medical, and full tort damages for disability, disfigurement, and pain. These benefits are "free". No member of this small class ever pays a nickel in premiums. The full compensation benefits will have to be paid for in higher premiums charged to the owners of vehicles. It is difficult to understand why those who pay nothing in premiums are treated so much more generously than those who pay the full bill for the benefits they get.

What rights do the other citizens get, who are owners or dependents or spouses of the owner of a vehicle? They get what they buy. The philosophy of the Bill, S. 945, is that a citizen who is made an outlaw on the highway, is subjected to a terrible risk of loss, and therefore if he is prudent he ought to buy health and accident insurance to protect himself. In order to make sure that he is prudent, he will be *compelled* to buy health and accident insurance, at whatever rate the private insurance industry sets. If he cannot afford to pay the price, he will not be allowed to drive.

The Bill does not set up a "free market", nor a regulated market. The consumer is compelled to buy, on pain of criminal penalty. The insurance industry is regulated as to the kind of benefits it must offer, but is free to combine and fix prices under a continuing exemption from Anti-Trust laws. There will be federal regulation of *classes* of risk, but no regulation of the rates within those classes by any federal agency.

The level of first party benefits contemplated by the Bill is substantial. The plan calls for payment of all hospital, medical and dental expense, and all rehabilitation expense "necessarily" incurred. The insurer and insured will wrangle over how much physiotherapy is "necessary."

A limited amount of wage loss will be paid, restricted by a ceiling of \$1,000.00 per month. An individual who earns more than this can buy more coverage, if he is willing to pay the premium.

The person who suffers disability or disfigurement or agonizing pain at the hands of a reckless driver, even though completely in the right, gets nothing. This is a change from the original version of S. 945, where the tort suit was preserved for a small percentage of victims suffering "catastrophic harm", defined as being more than 70% permanent partial disability. Under the original bill, the innocent victim who lost one leg could not recover for general damages, but if he lost both legs he could. This kind of discrimination is hard to justify, and has been changed in Committee Print 1 to provide for absolute injustice to everyone on a non-discriminatory basis.

Insurance companies are required to offer special policies providing benefits for either excess economic loss, or intangible damages, or both. Many companies now write accident policies for monthly disability benefits, so that a policy providing for wage loss over \$1,000.00 per month is not new. The "intangible damage" policy will be new. It will apparently provide that the insured can recover damages for disability and suffering of the amount that would have been available under tort law if tort liability had not been abolished, and the insurance company will be liable in a direct suit as though it were a negligent tort-feasor, even though the injuries were entirely the fault of the insured.

The innocent victim today enjoys this right of recovery, as part of his birth-right as a free American citizen. S. 945 alienates this right, but allows everyone to buy the right that the good driver now owns without cost. The philosophy for this approach, as expressed in the staff analysis of Committee Print 1., is that "free market forces" will determine whether the public wants to recover for intangible losses. This is like saying we will charge every citizen \$50.00 for the right to vote and then let free market forces decide whether Americans really want to exercise their right to a ballot.

THE COST OF S. 945

What will the benefit program of S. 945 cost the American motoring public? Actuaries are the people to predict this, but actuaries cannot predict the cost without knowing how many people will be injured and what losses they will sustain—and nobody knows those numbers. The only certainty is that the proposed system has to cost more than present liability insurance.

Compare the cost analysis of the original A.I.A. Plan. This proposed to pay all victims all medical expense unlimited in time; net wage loss limited to \$750.00 per month maximum; no recovery for disability or suffering; with all benefits reduced by making them secondary so the Plan would pay only the excess over other first party coverages of the victim. The new version of S. 945 calls for higher benefits, with a wage ceiling of \$1,000.00 per month and with substantially all payments primary, unreduced by collateral sources. The actuaries for A.I.A. said their original plan would cost less than existing liability insurance by as much as 25 per cent. Actuaries for A.M.I.A., the American Mutual Insurance Alliance, reviewed the *identical* data used by the A.I.A. actuaries and concluded the plan would cost 29 per cent *more*. That is a difference of 54 per cent when based upon the same data. The essential data for a true cost projection of S. 945 simply does not exist.

How many people are injured in automobile accidents each year? The D.O.T. study, *Automobile Accident Litigation*, says 4.4 million are injured each year, citing the *Statistical Abstract of the United States*, but the table cited in the *Abstract* is only a guess published by Travelers Insurance Company in a booklet called "Street and Highway Accident Facts", as the footnote shows.

In the same *Abstract* is published a National Safety Council Estimate, which says only 2 million are injured. In the D.O.T. study, *Economic Consequences of Auto Accident Injuries*, the research team published its estimate of 2.1 million, based on its sampling techniques. For the same year, the National Center for Health Statistics estimated 3.1 million persons were injured in automobile accidents seriously enough to require medical attention and lose one day's activities. A group called the "Insurance Information Council" has published in Ohio newspapers, to the writer's knowledge, a statement that 5.5 million are injured annually. Meanwhile, another regular department of the Department of Transportation publishes an annual compilation of "Fatal and Injury Accident Rates" which said, for the same year as the above statistics, that the total rate on all

state and federal highways, rural and urban, was 13.6 million accidents producing 2.6 million injuries. In its final report, D.O.T. said there were 4.2 million injuries, based apparently on a mis-reading of its earlier statement of 4.4 million.

With that vast range of estimates, how can any actuary tell how many total victims have to be compensated for medical payments and wage loss? How can anyone predict what the wage loss will be? Under the present system, a driver clearly to blame for the loss will limp back to work despite his pain, if he possibly can, to avoid loss of his paycheck. Under no-fault recovery, everyone can stay off work until fully recovered and free of all discomfort with no threat of wage loss. That may be a good thing, for the comfort of our citizens, but it has to be more costly.

In addition, S. 945 opens up a whole new class of claimants. Under the present system, only collisions are reported as accidents. Under Committee Print 1, payments are made for "injury" defined as meaning "accidental harm" defined as meaning "bodily injury caused by a motor vehicle accident while, in, or upon, or entering into, or alighting from a motor vehicle" among other things. People who trip and fall over the curb while getting out of a car are not now reported as "automobile accident" victims. People who fall off a stool while waxing the car are not now reported but will come with the payment provisions of S. 945 since the injury arises from the "maintenance" of the car. Maintenance or "use" also including unloading, so as we can expect some claims of sprained back while unloading luggage from the trunk under this proposal.

The number of additional claims may not seriously increase the cost. The great cost increase will come from the payment of all serious injury and fatality cases, where the major portion of insurance pay-out goes now and will continue to go under no-fault plans.

D.O.T.'s study of "Economic Consequences" showed that the relatively small number of fatality cases suffered extremely high losses, on the order of \$89,000.00. The detailed study of accidents in the Metropolitan Area of Washington, D.C., showed that 49 per cent of the fatal accidents were single car collisions. In one third of them the car hit a bridge abutment or other fixed object at high speed or left the road completely with off-highway impact or roll-over producing death. These cases do not enter the tort system, since the death is not the fault of the bridge support or telephone pole. They will all come in, with heavy demand for payment under no-fault. In the class of "Serious Injuries" studied by D.O.T. at least one-third were single car cases outside the tort system, but now to be classified as fully compensable under S. 945. The cost will be high.

A fair idea of the cost increase can be generated from the D.O.T. final report, Motor Vehicle Crash Losses and Their Compensation in the United States, where it said in Table 2, page 6, that after making all appropriate deductions, the estimated compensable economic loss resulting from 1967 automobile accidents (sustained chiefly by seriously injured and fatality victims) was a total of \$10,549,000,000.00, of which \$4,860,000,000.00 was property damage. This means that compensable economic loss for medical, wage loss, and incidental related expense was \$5,689,000,000.00.

If we assume the maximum achievable pay-out efficiency of a no-fault system is 65 per cent pay-out and 35 per cent administrative expense, as its proponents claim, then it would have required total bodily injury premiums at 1967 expense levels of \$8,750,000,000.00 to make those payments. The total premiums for all bodily injury coverage written by all insurers in the United States for that same year, 1967, according to a Hart Committee publication (attributed to "The Spectator") was \$4,991,133,000.00. If these figures are valid at least 75 per cent more premiums would have been required in 1967 (assuming that a 65 per cent efficiency in pay-out was possible).

The extra cost cannot be made up on the property damage side. In that same year, 1967, 2.09 billion dollars in property damage insurance was written, and 3.72 billion in first party physical damage was written, for a combined total of 5.79 in automobile damage premium covering both third party and first party coverage. Under S. 945, all liability is abolished so that total automobile damage (unless the victim swallows it) will have to come out of the first party collision coverage. Total damage premiums of 5.79 billion in 1967 could not have paid the 4.86 billion total property damage loss in that year as stated by the D.O.T. final report.

Up to this point the discussion has centered only on total cost. The distribution of cost among drivers is likely to be even more critical. Under the present system

the premium rate reflects the risk that the particular driver will *cause* the loss, that is, that he will be at fault in hitting someone else. Statistically it can be shown that most drivers pay a relatively low rate, as "good risks"; and a relatively small group of "bad risk" drivers pay a high rate.

Under a no-fault system, the rate will have to reflect the risk of *sustaining* loss, of being struck. The good driver may have little risk of smashing into the rear-end of another car stopped at the light, but he has a necessarily higher combined risk of both being hit in the rear while blameless and hitting someone else when blameworthy. Present rate structures reflect the difference in fault and no-fault coverage. Property damage liability is third party, fault insurance. Collision damage is first party, no fault insurance. From a rate book for Minnesota (the only one the writer has) it can be seen that the rate for Rochester, Minnesota, for 10/20 bodily injury coverage, for a standard six-month period, is \$17.42 for the best risk driver, class 1A, and \$62.00 for the poorest risk, class 2C. The ratio is 3.5+ to 1 as between poor risk and good risk. For property damage insurance, \$5,000.00 limit, the six-month rate for the 1A driver is \$13.76, and for the 2C driver it is \$49.50. This is ratio of 3.6 to 1, almost identical with the spread for bodily injury coverage. Now compare the difference in the spread for first-party, no-fault, collision coverage where the risk is both the risk of hitting someone else and getting hit. For \$50.00 deductible collision on identical cars, the good driver 1A rate is \$24.16 and the poor risk 2C rate is \$54.36. This is a ratio of only 2.25 to 1.

Under the present fault system the worst risk of all possible risks is the 17 year old male, with no driver training, possessing his own car. He had an inordinately high risk of being to blame for a high speed collision, often with serious and fatal result. Under the plan of S. 945 he becomes a fairly good risk. If he becomes a fatality case, he has no dependents to claim lost support. If injured, he will lose no wages. The chief risk is medical expense, and youth tends to heal fast without the lingering complication suffered by the older driver with arthritic joints.

The middle-aged, hard-working, average family man is likely to be a good risk under present classifications. Under no-fault, he is not as good a risk. His recovery rate from injury is slower. If injured he is likely to demand the best medical attention, at high cost, and sustain near maximum monthly wage loss. Even if total rate income remains the same, the low risk driver will have to pay a higher rate and the present high risk driver will pay a lower rate. One authority in the field, Professor Brainard of the University of Rhode Island has calculated that about two-thirds of the drivers will pay more for no-fault coverage and one-third will pay less. In addition, the elimination of general damages will change the cost benefit ratio for the majority group of good drivers so that a dollar of benefit expectation would, in the average case, cost two-thirds more than it does even if over-all premium income was reduced by the Massachusetts rate of 15 per cent. (Trial Magazine for October-November 1970.)

In summary, under the proposed no-fault system of S. 945, rating classifications reflecting the total change in risk should result in a majority of drivers paying higher premium if over-all premium income were to remain the same as it is under present rates; but over-all premium income will have to be greatly increased to pay all the compensable loss to all victims under no-fault.

THE ILLUSION OF COST-SAVING

It has become popular for proponents of no-fault to claim that under the present system only 45¢ of the premium dollar is paid out in total benefits, and that the victim gets only a small percentage of fact. This figure derives from a chart presented to the Hart Committee by Professor Keeton, which hypothesized Administrative Costs of \$125.00 for each \$100.00 in benefits paid, based upon some partial data gathered by Professor Conard in a one-state study in 1961. The figure of 55¢ cost and 45¢ benefit, now widely circulated, is completely false. If any state insurance Commissioner permits the insurance industry to charge rates so high that only 45¢ of the premium dollar is paid out in claims then that Commissioner is incompetent to hold office. The Hart Committee, at the same time it published the Keeton chart, published its own 10 year study called "Where Your Auto Insurance Premiums Went—1959 to 1968." This study reported total benefits paid as being 58 and $\frac{1}{2}$ per cent of the premium dollar, total expense as 40 and $\frac{1}{2}$ per cent, with underwriting profit of 1 per cent. The same publication showed that in 1968 the loss-expense ratio, comparing all claims paid and outstanding

with all insurance company expense, was in close accord with the 10 year average. For all stock companies, national totals, for bodily injury coverage, the expense ratio was 40 per cent and the claim ratio was 60 per cent. How does that compare with "No-Fault" ratios? Collision coverage is exclusively first-party, no-fault, automobile coverage with relative ease of determining the value of the loss. In the same year, 1968, the stock company national total for collision coverage showed a ratio of 38 per cent expense, 62 per cent claims. The slight difference, 2 per cent, is a far cry from the fictitious 20 per cent improvement Professor Keeton claims would occur on a change from his imaginary 45 per cent pay-out under tort to his hopefully optimistic 65 per cent pay-out under no-fault.

It should be noted that in the same Hart Committee study of past decade performance the total loss paid ratio under property damage liability (third-party fault coverage) was 57.8 per cent for all companies, while automobile physical damage pay-out (first-party, no-fault) was only 54.9 per cent.

There is no reason to believe that first-party, no-fault injury coverage can magically produce a substantial expense ratio reduction.

Injuries will still have to be investigated, and haggled over. Was there really an accident? Was the claimant really a victim? Was he hurt as much as he claims, or is that merely a recurrence of an old injury? Did he really have to lay off work at all? Did he lose as much pay as he claims? Is he still disabled, or just gold-bricking? Was all that diathermy really given? If so, was it "necessary"? Are the medical bills "reasonable" or inflated? Whose doctor is right, the insurance company optimist who says he can do heavy work right now or the claimant's pessimist who says he can't do even light work for a month?
